Harmonium, a musical instrument, for the invention of which many claims have been advanced. The arrangement by which the sounds of the harmonium are produced is called the *free vibrating reed*, supposed to have been a modern discovery, but now ascertained to have been known in China long before it was ever heard of in Europe. Its construction is as follows: A narrow rectangular slit being made in a piece of brass-plate of a quarter of an inch in thickness, a thin elastic spring of the same metal, and of nearly the exact breadth of the slit, is fixed at one end by two small rivets to the surface of the plate, close to one end of the slit, and is so adjusted that it fills the area of the slit, and, when pressed into it at the free end, can pass inwards without touching the end or the sides of the slit, and when left to itself it can return back to its position of covering the slit. The spring at the free end is permanently bent a very little outwards. When a current of air is forced through the slit, the spring is put into vibration, and produces a continuous musical sound, acute or grave, according to the rapidity or slowness of the vibrations. This kind of reed is termed 'free,' in contradistinction to the reed of the organ-pipe, the spring or tongue of which entirely covers an oblong slit, in the side of a brass tube closed at one end, and vibrates against the cheeks or outside of the slit, instead of within it.

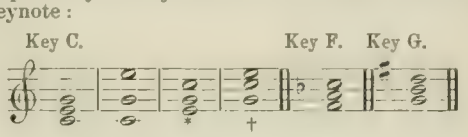
After many attempts, in various countries, to construct a keyed instrument of really a useful kind with the free reed, Debain of Paris produced his invention (1840) of the harmonium, which became more or less the model of all the others that have followed. The harmonium occupies comparatively little space, being only about 3 feet 3 inches high and 4 feet broad, the depth being according to the number of the stops, usually from 20 to 23 inches. It has a compass of five octaves of keys from C to C, the key-board being placed on the top, immediately below the lid. Under the key-board is the bellows-board, in which are valves for each key; while above the valves are the different rows of reeds. The sizes of the reeds differ, according to pitch, from about 3½ inches long to ½ inch; and the quality of sound is affected and modified by the breadth of the vibrating part of the reed, and the shape of the aperture in the bellows-board covered by the valve. The pressure of wind is from a bellows with two feeders, which the player moves alternately with his feet, filling a reservoir, similar to the bellows of a small organ. When a key is pressed down, the valve opens, and the wind, which has access from

the bellows to the wind-chest, rushes through the slit of the reed, and produces a sound which continues as long as the valve is kept open. It is a peculiarity of the free reed that an increase or a diminution of the pressure of wind does not alter the pitch of the sound, but merely increases or diminishes its volume. Advantage may be taken of this peculiarity by the harmonium-player to effect a *crescendo* or *diminuendo* by gradually augmenting or decreasing the pressure of the wind. The vibrations of the spring being like those of a pendulum, isochronous, remain fixed in rapidity or slowness, according to the length and elasticity of the vibrating slip of metal, and thus regulate the pitch of the sound without reference to the pressure of wind. For the deep bass-notes the springs are heavily loaded at the loose end, to make them vibrate slowly; while in the higher notes they are made thinner at that end.

Harmoniums are made of various sizes, and from one row of reeds (or vibrators, as they are now called) to four or more rows. Each row is divided near the middle, between an E and F; and each half has its separate draw-stop. Knee-pedals are sometimes added for producing the same modifications of tone as the swell on the organ. Some harmoniums are made with two rows of keys, thus affording a greater variety in playing solo with an accompaniment; and for more skilful performers, pedals for the feet, similar to organ-pedals, are attached. The manufacture of the harmonium in Paris has, of late years, increased almost incredibly. The various parts of the harmonium can be obtained there ready-made, from a single reed to a complete set. The best-known makers are the Alexandres and Mustel in France, and Bauer in England. The *Seraphine* was a similar but much inferior instrument. The *American Organ*, introduced in 1861 by Messrs Mason & Hamlin, is a kind of harmonium which acts by wind exhaustion or suction, and instead of force bellows, works by exhaustion bellows. Its tone is softer, and its timbre less reedy; it is also easier to play. But the true harmonium is capable of higher treatment. The *percussion action* for the harmonium is due to a small hammer like that of a pianoforte, which strikes a blow on the vibrator the moment the key is pressed down, and sets it instantly into vibration, thus assisting the action of the wind. The *expression* stop—an invention of the Alexandres, father and son—is used almost continuously by the best players on the instrument, but is very difficult to manage. By the action of this stop, the air-reservoir is cut off, and the pressure becomes entirely dependent on the management of the bellows. The latest invention of importance is the *melody-attachment* of Dawes—the date of the patent was 1864—which gives predominance to any special note or notes in the upper part of the harmony, by a contrivance which shuts off all notes except the highest, in certain registers of a combination. Harmoniums may now be had of various sizes and qualities, at prices from £5 to £120. Valuable for accompanying psalmody, they suitably take the place of organs in temporary places of public worship, or among the less opulent class of congregations; but of late years the French school of players, headed by M. Lemmens, have treated the harmonium with success as a brilliant solo instrument. For domestic use, harmoniums are not likely to supersede the pianoforte; but possessing the important advantage of not going out of tune through humidity of atmosphere, they will be found available in climates where pianos cannot properly be kept.

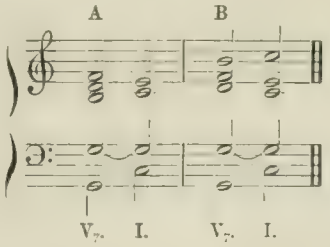
Harmony, paradoxical as it may seem to the lay mind, is the science of discord. It treats of the laws which control the relationship of one chord or set of chords to others, and which decide the relation to the fundamental concord of the dissonant elements in a discord.

Concords.—A chord or combination of several tones in any scale or key may be a concord or a discord. The one concord in a key consists of the tonic or keynote and the notes which are respectively a major third and a fifth above the keynote:

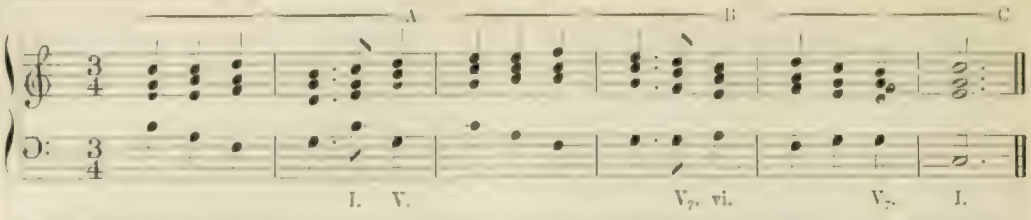


* and † are respectively the first and second 'inversions' of the chord. These three are the notes which nature gives us as producing a perfect sound in combination (see HARMONICS); they are therefore called 'consonances,' and any foreign element is a 'dissonance.' This 'common chord' or 'triad' makes a starting-point and a point of finality from which the harmonies proceed, round which they rally from time to time, and into which finally they resolve themselves. It is with few exceptions the first and invariably the last chord in any composition. One dissonance suffices to change a concord to a *discord*, which can be effected by adding to the notes of this common chord, or by changing their relationship to each other, &c.; and the fundamental law of harmony is that discord *as an incomplete idea* must give place to concord before the ear can be satisfied. This process is called 'resolving' the discord. Thus concords stand firm like the straight lines or outstanding features in a landscape; while discords supply the curved lines of beauty, the effects of perspective, and the variety which gives interest to the picture.

Discords.—The seventh harmonic of nature which is a minor seventh distant from the root—i.e. one semitone *less* than the seventh consecutive note in an ascending major scale—produces a discord which, with its complementary or *fulfilling* concord, is the foundation of all harmony. This discord is called the DOMINANT SEVENTH (its sign is V_7.), and its 'resolution' is the triad of the key to which it belongs—i.e. the chord of the tonic (I.).



A is an example of 'close,' B of 'open' or 'extended' harmony. Because the discord on G seems thus to demand the chord of C as its resolution, the note G (or similarly the fifth degree in any scale) is called the *dominant* (V.) of that key, and the chords and discords built on it constitute the dominant harmonies. Position B is the most satisfactory to the ear, because of the effect of finality induced by the resolution to the first position of the triad; and the two chords together form the *dominant* or *authentic cadence*—the most important of those terminal phrases which serve in music much the same end as commas, semicolons, and periods in composition. 'God save the Queen' offers examples of two other important cadences, showing at the same time how these mark the completion of more or less final musical periods.



The first period is closed at A by a 'half' or 'imperfect' cadence—i.e. the order V.—I. is reversed; the second at B by a 'false' or 'deceptive' cadence—i.e. the dominant chord, instead of proceeding to the tonic, 'deceives' the ear by proceeding to another chord; the third period is brought to a close by the authentic cadence at C.

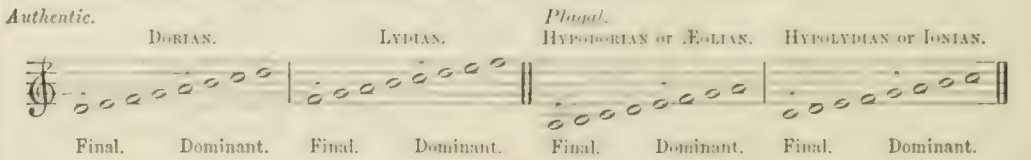
The dominant chord can also bear the more elaborate dissonances of the ninth, eleventh, and thirteenth, as well as the seventh.

Root C (V.).....Root F (I.)

It is impossible here to enter into the varieties of discord—'suspensions,' 'double-root chords,' &c., into the analogous discords which may be built on the tonic as a ground-note, or the chords belonging to the minor scale. Suffice it to say the effects which can be evolved from the almost innumerable inversions and involutions of single chords and combinations of chords are subject to natural laws as stringent as those governing the growth of flowers and trees, and the possibilities of variety in this unity are as infinite.

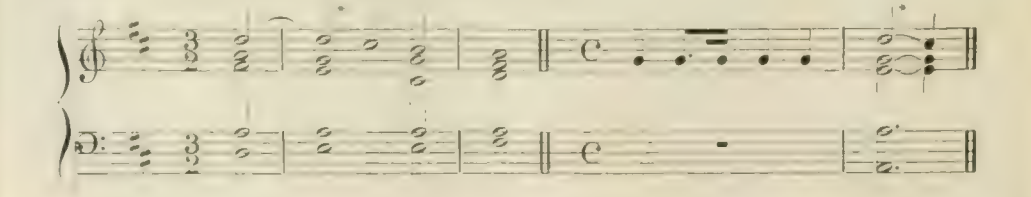
Modulation. One branch of the subject can hardly be left without mention—i.e. *modulation* or change from one key (or 'mode') to another. Our modern scales have had the relation of their intervals so modified (see TEMPERAMENT) as to be approximately alike. By the addition of a single sharp or flat any melody can proceed from the key of C to G (with F♯), F (with B♭), or A minor (with G♯). These—the dominant, subdominant (next below the dominant), and the minor of the sixth degree—are the keys of the *first relation*, as out of the seven notes which constitute each scale six are present in the scale of C, thus providing as it were six more or less convenient bridges by which to pass from one key to the other. The conventionality of these modulations makes them inadequate to convey the more passionate colouring of modern music, and more striking changes to remoter keys are necessary. A favourite device with modern composers is to take advantage of the 'tempered' system, and by using one note in two significations (e.g. F × E♯) to secure means of startling and also of very tender effects in modulation.

History. The complete Greek scale as formulated by Pythagoras is represented by three octaves of our scale of A minor, beginning at the A in the first space of the bass clef, and using no black notes. Various sets of eight notes selected from this extensive scale were called after districts of Greece, and in the 4th century St Ambrose adopted four of these names when he laid the foundation of modern music in what are called the Gregorian Modes. They received their name from Pope Gregory, who added four others beginning on the respective dominants, and called them *plagal*, as distinct from the *authentic* modes of St Ambrose. The most important of these are



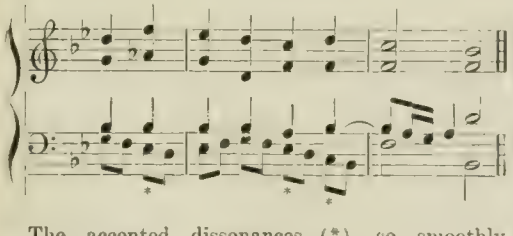
The Dorian and Æolian, and less frequently others even more at variance with our conventional scale, are still in occasional use; and peculiarly plaintive effects can be obtained from the absence of the 'sharp seventh' to which our modern ears are so accustomed.

In Counterpoint, the science which preceded harmony, attention was given altogether to the correct progression of the individual voices or parts, while the combinations made by the voices at any moment were regarded as merely accidental. But unconsciously the ear of musicians was being cultivated, and the richness of Palestrina's simpler writings must have shown the possibility of obtaining undreamt-of effects from chords as integral units in a march of harmonies, rather than accidental combinations of independent melodies. One of the fundamental rules of counterpoint was that a dissonance must either be 'prepared'—i.e. it must appear as a consonance in the previous chord—or else it must be approached very gradually. This rule of the old science was disregarded by Monteverde (1608), who used unprepared discords, and thus at one blow the new feeling for chords was released from its bondage to counterpoint.



The chords at * present the same discord—the eleventh and seventh on A, the dominant of D. The first is carefully prepared, and so has a smooth effect; the second is quite 'free' in its entry, and has a sudden and startling effect.

Only one who understands counterpoint and harmony can appreciate the full importance of the new departure. It meant that discords were no longer mere variations of concords, but individual creations with an individual's rights and duties. The discord most easily used was the dominant seventh, the first discord produced by nature's harmonics; and so the relation of dominant to tonic—the central idea of all harmony—developed from an increasingly general tendency into a recognised rule. During the 17th century many experiments were made by Monteverde's followers, until at the end of the century Rameau's famous treatise called attention to the fact that all chords are derived from some note which is the generator or root, and the relationships of these roots govern the progressions of the harmonies. The less known, but hardly less important, researches of Tartini formed a good supplement to Rameau's theory; and the basis of scientific harmony established by these two works has not been seriously disturbed even by the thorough investigation and the astonishing discoveries of Helmholtz, who has extended the foundation and built a complete superstructure thereon. In the meantime, while theorists fought each other with great fierceness just as their successors do to-day, the science made extraordinary progress under such practical harmonists as Bach, Mozart, and Beethoven. Bach's daring but unerring feeling for harmony, his grasp of the mysteries of chord-relationship, and his unequalled skill in part-writing enabled him as early as the beginning of last century to transform an ordinary progression of simple chords into such a passage as



The accented dissonances (*), so smoothly introduced and yet so striking, are extremely effective. Haydn's work, and Mozart's also, is considerably softer; their use of discord proved insufficient for the expression of the great passion which is the feature of Beethoven's later work. The romanticism of Schumann required still freer scope, and Wagner, who handles any number of parts as easily as did Bach himself, has enlarged the possibilities of harmony so far that it is difficult to conceive of any further advance. Theoretical harmonists have followed fast in the train of these great composers, and, as system after system proved inadequate for the analysis of new harmonies or new uses of old harmonies, the revered names of each generation have been pushed aside more or less contemptuously by succeeding schools.

Among the most famous works on harmony are those by Rameau, Logier, and Dr Day; Richter's text-book long used at Leipzig Conservatorium is a very good example of last generation's guide: and it is England's proud boast to-day that the attempt to reconcile theory with practice is most successful among her musicians. Sir George Macfarren's *Harmony* is founded on Dr Day's system; Sir Frederick Ouseley's is even more scientific; and probably the most successful, as well as certainly the most readable of all, is Sir John Stainer's *Theory of Harmony*. Sir George Macfarren's six *Lectures*, delivered at the Royal Institution, give an exhaustive and popular account of the progress of harmony; and more technical readers will find much that is instructive in Dr Parry's brilliant article in Grove's *Dictionary of Music*.

Harmony of Gospels. See GOSPELS.

Harms, CLAUS, German divine (1778–1855), whose memorial work, *Das sind die 95 Theses oder Streitsatze Luthers* (1817), in celebration of the tercentenary of the Reformation, produced a sensation in Germany.

Harnack, THEODOSIUS, a Lutheran theologian, was born at St Petersburg in 1817, and studied at Dorpat, where he was professor of Theology from 1848 to 1853, next till 1866 at Erlangen, and again at Dorpat till his retirement in 1873. He died in 1889. His principal works are his *Praktische Theologie* (3 vols. 1877–82) and *Katechetik und Erklarung des kleinen Katechismus Luthers* (2 vols. 1882). —Of his sons, all of whom have attained to some distinction, the most famous is ADOLF, who was born 7th May 1851 at Dorpat, where he studied from 1869 to 1872. He was appointed *privat-docent* for church history at Leipzig (1874), extra-ordinary professor there (1876), and ordinary professor successively at Giessen (1879), Marburg (1886), and Berlin (1888). His chief writings are *Zur Quellenkritik der Geschichte des Gnostizismus* (Leip. 1873); *Die Zeit des Ignatius und die chronologie der antiochenischen Bischofe* (Leip. 1878); *Das Monchtum, seine Ideale und Geschichte* (2d ed. Giessen, 1882); *Lehrbuch der Dogmengeschichte* (3 vols. 1886–90; Eng. trans. 1894–97); *Die Geschichte der altchristlichen Litteratur* (vol. i. 1893). *The Outlines of the History of Dogma* (trans. 1893) is a translation of the *Grundriss* (2d ed. 1893). Prussian orthodoxy was greatly scandalised by his treatment of the Apostles' Creed in *Das Apostolische Glaubensbekenntniss* (1892), and agitated for his removal from his post. In conjunction with Von Gebhardt and Zahn he edited the *Patrum apostolicorum opera* (3 parts, Leip. 1876–78); and with Von Gebhardt alone the *Texte und Untersuchungen zur Geschichte der altchristlichen litteratur* (12 vols. 1882–94). He was also joint-editor of the *Theologische Litteraturzeitung* established by Schürer (1876). — AXEL, Adolf's twin-brother, who died in 1888, was a distinguished mathematician, and wrote on the calculus; ERICH, another brother, became a professor of Physiology at Halle; and a fourth, OTTO, wrote on Goethe.

Haro, a town of Spain, 31 miles by rail NW. of Logroño, is prettily situated on the right bank of the Ebro. Good red wine is grown in the neighbourhood. Pop. 7600.

Haro, THE CRY OF, an old form of appeal in Normandy and the Channel Islands. The word was anciently understood to be an appeal to Rolf, Rollo, or Rou, the first Duke of Normandy; a better derivation seems to be from the Old High German *hera* or *hara*, 'here,' making haro simply a cry for aid.

Haroëris, the elder Horus, son of *Seb*, the Egyptian Saturn, and *Nu*, or Rhea. He was the brother, and not the son, of Osiris; and he was ruler over the heaven. He was identified with the sun and Apollo. See EGYPT (Vol. IV. p. 235).

Harold I., surnamed HAREFOOT, king of England, was the younger of Canute's two sons by his first wife, Alfgiva. On the death of Canute in 1035, the witan bestowed upon Harold all the provinces north of the Thames; while the possession of Wessex in the south was given up to Canute's second wife, Emma, for her son Hardicanute. But in 1037 Wessex also submitted to Harold. Beyond a futile invasion of the country by Alfred, son of Ethelred, and raiding incursions by the Welsh and Scots, Harold's reign was

marked by no events of importance. He died at Oxford in March 1040.

Harold II., the last of the native English kings, was the second son of Earl Godwin by his Danish wife Gytha, the sister of Earl Ulf, and was born about 1022. At an early age he was made Earl of the East Angles, and he shared his father's outlawry in 1051, finding a refuge in Ireland. Next year, together with his brother Leofwin, he crossed the Channel with nine ships, defeated the men of Somerset and Devon at Porlock, and ravaged the country, next joined his father at Portland, and shared the triumph of his return. Harold was at once restored to his earldom, and next year (1053) succeeded to his father's earldom of the West Saxons. Henceforward he was the right hand of King Edward, and still more after the deaths of the old Earls Leofric and Siward, he directed the whole affairs of the kingdom, with an unusual union of gentleness and vigour. His brother Tostig succeeded Siward as Earl of the Northumbrians in 1055, and two years later two other brothers were raised to earldoms: Gurth to that of the East Anglians, Leofwin to one formed out of Essex, Kent, and the other shires round about London. Meantime Harold drove back the Welsh marauders of King Griffith out of Herefordshire, and added that post of danger to his earldom. The death in 1057 of the Ætheling Edward, the son of Edmund Ironside, who had been brought back from Hungary as heir to the throne, opened up the path for Harold's ambition, and from this time men's eyes rested on him as their future king. And nature had equalled fortune in her kindness, for his handsome and stalwart figure and his gentle and conciliatory temper were kingly qualities that sat well upon his sagacity, his military skill, and his personal courage. Harold's policy throughout was thoroughly English, contrary to the predominant French influences that had governed the early part of Edward's reign. He was English in everything, even to his preference for secular priests to monks. He made his pilgrimage to Rome in 1058, and after his return completed his church at Waltham, known later as Waltham Abbey. In 1063, provoked by the fresh incursions of Griffith, he marched against him, and by making his men put off their heavy armour and weapons, and adopt the Welshmen's own tactics, he was able to traverse the whole country, and beat the enemy at every point. Griffith was killed by his own people, whereupon Harold gave the government to the dead king's brothers, Bleddyn and Rhiwallon, who swore oaths of fealty both to King Edward and to himself.

It is impossible to say exactly at what date occurred that famous visit of Harold to the court of Duke William in Normandy, of the results of which the Norman writers make so much, although with many contradictions, while the English writers with the most marked and careful unanimity say nothing at all. It seems most likely that Harold did make some kind of oath to William, most probably under compulsion, when he had fallen into his hands after being shipwrecked on the coast of Ponthieu, and imprisoned by its Count Guy. Mr Freeman thinks the most probable date to be 1064. It is at least certain that Harold helped William in a war with the Bretons, and in the Bayeux tapestry we see his stalwart form lifting up two Normans at once when they were in danger of being swept away by the river Coesnon which divides Normandy from Brittany. The Norman writers make Harold formally swear fealty to William, promising to marry one of his daughters, and we are told that additional sanctity was given to this oath by its being made upon a chest full of the most sacred relics.

In 1065 the Northumbrians rebelled against the rule of Tostig, and Harold found himself compelled between policy and a sense of justice to side with them, and to acquiesce in their choice of Morcar and the banishment of Tostig. At the beginning of 1066 King Edward died, his last breath being to recommend that Harold should be chosen king. He was crowned on January 6, and at once set himself with steadfast energy to consolidate his kingdom. At York he won over the reluctant men of Northumbria, and he next married Ealdgyth, Griffith's widow, in order to secure the alliance of her brothers, Morcar and Edwin. His short reign of forty weeks and one day was occupied with incessant vigilance against the attacks of two formidable enemies at once. Duke William lost no time in beginning his preparations for the invasion of England, and Tostig, after trying the Normans and the Scots, and filibustering along the coasts on his own account, succeeded in drawing to his side the famous Harold Hardrada, king of Norway. In the month of September the two reached the Humber, and Harold marched to meet them, resting neither day nor night. The Icelandic historian Snorro in his dramatic narrative of the fight tells how Harold rode out accompanied with twenty of his housecarls to have speech with Earl Tostig and offer him peace, and when asked what amends King Harold should have for his trouble in coming, replied, 'Seven feet of the ground of England, or more perchance, seeing he is taller than other men.' At Stamford-bridge Harold overtook his enemy, and after a bloody struggle won a complete victory (September 25, 1066), both Tostig and Harold Hardrada being among the slain. But four days later Duke William landed at Pevensey. Harold marched southwards with the utmost haste, bringing with him the men of Wessex and East Anglia and the earldoms of his brothers; but the two earls Edwin and Morcar held aloof and kept back the men of the north, although some of the men of Mercia, in the earldom of Edwin, followed their king to the fatal struggle which was fought out from nine in the morning till past nightfall on the 14th October 1066. The English fought with the most stubborn courage, and the battle was only lost by their allowing the pretended flight of the Normans to draw them from their impregnable position on the crest of the hill, ringed with an unbroken shield wall. On its slope right in front of the Norman army waved the golden dragon of Wessex, as well as the king's own standard, a fighting man wrought upon it in gold. Here Harold stood with his mighty two-handed axe, and hewed down the Normans as they came. Before nightfall he fell pierced through the eye with an arrow. His housecarls fought where they stood till they fell one by one; his brothers Gurth and Leofwin died beside him. The king's body was found upon the field, recognised only by a former mistress, the fair Eadgyth Swanneshals ('Edith of the swan's neck'). At first William ordered it to be buried on the rocks at Hastings, but seems after to have permitted it to be removed to Harold's own church at Waltham. Than Harold no braver or more heroic figure ever filled a throne; no king ever fought more heroically for his crown. If he failed, it was because he had to bow his head to fate, and in his death he saved all the honour of his family and his race. His tragic story has given a subject for a romance to Lytton, and for a stately drama to Tennyson. For the history, see vols. ii. and iii. of Freeman's *History of the Norman Conquest*.

Harold I., surnamed HAARFAGER ('Fairhaired'), the first king of all Norway, was the son of Halfdan the Black, the most powerful of the jarls or petty kings of south-eastern Norway. According to the popular story, he loved a high-

born maiden named Gyda, but she declared she would not be his wife until he was sole king of Norway; he in his turn thereupon took an oath that he would neither cut nor comb his hair until he had accomplished her bidding. After a severe struggle of some years' duration (863-872) he subdued, first the chiefs between Throndhjem and the Sogne Fjord, and finally the kings of the south-west, whom he defeated in a naval battle near Stavanger. The conquered districts he placed under the rule of his own jarls, or such as were devoted to his service. This led many of the old nobles to emigrate to the Orkneys, the Hebrides, and to Iceland, whence they conducted a series of piratical expeditions against Norway, until at length Harold was constrained to sail westwards and chastise them in their own seas. In his old age Harold divided his territories amongst his sons, and died at Throndhjem, which he had made his capital, in 930, leaving the supreme power to his son Eric, surnamed Bloody-Axe.

Harold III., surnamed HAARDRAADE or HARDRADA ('stern in council'), king of Norway, and one of the most famous of the old Viking chiefs, was a descendant of Harold I. Whilst still a boy he was present at the battle of Stikklestad (1030), in which his brother, St Olaf, king of Norway, was slain. Harold himself sought an asylum at the court of his relative, Yaroslaff, prince of Novgorod. Thence, going on to Constantinople, he became captain of the Varangians or Scandinavian bodyguard of the Greek emperors, and in command of them defeated the Saracens in several battles in Sicily and Italy. On his return to Constantinople, he drew upon himself the vengeance of the Empress Zoe, whose proffered love he rejected, and with difficulty made good his escape to Russia, where he married the daughter of Duke Yaroslaff. But he did not remain in Russia. He returned about 1045 to Norway, where his nephew, Magnus (the son of St Olaf), agreed to divide the supreme power with him, in exchange for a share of his treasures. The death of Magnus in 1047 left Harold sole king of Norway, and Svend king of Denmark; but with Svend Harold waged unrelenting war until 1064. This king changed the capital of Norway from Throndhjem to Opslo, now a suburb of Christiania. Two years later he landed in England, to aid Tostig against his brother Harold, king of England, but was slain in battle at Stamfordbridge, where also the flower of his warriors fell.

Haroun, surnamed AL-RASCHID (more properly Harún er Rashíd, 'the orthodox'), the most renowned of the Abbaside califs, was born in 763, and succeeded his elder brother, El Hádi, in the califate, in the year 786. He owed his peaceful accession to the sagacity of the Barmecide Yahya, whom he at once made his grand-vizier. To him and his four sons he left the entire administration of his extensive kingdom; and the energy of their administration, the enforcement of order, and the general prosperity of the country proved that his confidence was not misplaced. Meantime Haroun gave himself up to the pleasures of life, and his own taste and hospitality quickly made his court at Bagdad a brilliant centre of all the wit, learning, and art of the Moslem world. Himself an accomplished scholar and poet, he gathered round him the best scholars, poets, and musicians of his age, and heaped rewards upon them with lavish prodigality. Towards the end of his reign a strange and deeply-rooted hatred towards the Barmecides (q.v.) filled his mind, and in 803 he caused the vizier, his four sons, and all their descendants save one, to be executed, not even excepting his favourite Jaafer (Giafar), who had been his constant companion in his famous but apocryphal nocturnal rambles through the streets of Bagdad. But the retribution of heaven quickly followed; his affairs fell into irretrievable confusion; treason and rebellion, no longer dreading the far-reaching arm of the able vizier, showed themselves in every corner of the empire; and, when it was too late, Haroun repented bitterly his ferocious cruelty. To quell a formidable rising in Khorassan, in the north-east of the empire, Haroun marched in person against the rebels, but an attack of apoplexy obliged him to remain behind in Tûs, where he soon afterwards died, in the month of March 809. Haroun the Magnificent is the hero of many of the stories in the *Arabian Nights*, which have thrown a false halo round his memory; for with all his enlightenment, there was room in his heart for the most merciless and blood-thirsty ferocity. See Gibbon's *History*, Weil's *Gesch. der Chalifen*, and Professor E. H. Palmer's sketch in the 'New Plutarch' series (1880).

Harp, a musical stringed instrument, much esteemed by the ancients. In Egypt it attained an early and unequalled maturity, and is delineated in the sculptures from the earliest ages in many different forms. The great Egyptian harp stood nearly 7 feet in height, and carried 18 sonorous bass and tenor strings. Its immense frame shimmered with all the colours of the rainbow, and was further ornamented with massive carvings, gold, and precious stones. The Assyrian and biblical harp was a small instrument, easily carried in the hand, and resembling more a Lyre (q.v.) than a true harp. The harp was not in use among the Greeks and Romans; but the *kantela*, to which the Finns chanted the *Kalevala*, was a sort of primitive harp. The Celtic bards held the instrument in the greatest honour. The old Scottish harp was about 3 feet high, a foot and a half broad, and carried about thirty strings. Seven harps earlier than the 18th century are in existence, and are described in Hipkins' *Musical Instruments, Historic, Rare, and Unique* (1889). The Welsh triple harp is a large instrument, furnished with three rows of strings. Of these, two rows are tuned in unison and in the diatonic scale, the remaining one in the sharps and flats of the chromatic. In Ireland the harp was so celebrated an instrument in the remotest times that the Italians of the middle ages believed their harp to be derived from Ireland. The most familiar forms of harp are the Italian, the medieval, and the pedal harp. The first is strung with two rows of wire-strings, separated by a double sound-board; this kind is now little used, being very imperfect. The second is in the form of a triangle, with a sound-board and gut-strings; it is always tuned in the principal key of the music, while the strings are altered to suit any modulations out of the key, by pressure of the finger, or turning the tuning-pins of certain notes. The adaptation of the harp to the modern chromatic scales led to the invention of the pedal harp, which has seven pedals, by which each note of the diatonic scale, in all the different octaves, can be made a semitone higher. The compass of the pedal harp is from contra F to D of the sixth octave above. In order to have the B flat, it must be tuned in the key of E flat. The music for the harp is written in the bass and treble clef, the same as pianoforte music. A celebrated harpist, Hochbrucker, in Donauwörth, invented the pedals in 1720; others say they were invented by J. Paul Verter, in Nuremberg, in 1730, who at least added the piano and forte pedal. The facility of playing chromatic intervals, and in different keys, was still more completely attained by the invention of the double-action pedal harp by Erard in Paris, in 1810. By means of Erard's invention, each string can be sharpened twice, each time a

semitone, so that the C string may be C flat its full length, C natural by the first movement of the pedal, and C sharp by the next movement. The double-action harp is tuned in the key of C flat.

Harpe, JEAN FRANÇOIS DE LA. See LA HARPE.

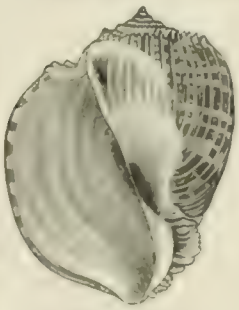
Harper and Brothers, a well known firm of New York publishers, consisted originally of James (1795–1869), John (1797–1875), Joseph Wesley (1801–70), and Fletcher (1806–77). James and John commenced to publish in 1818, and, under the style of J. & J. Harper, issued about 200 works. The firm of Harper and Brothers was established in 1833, and is now carried on by the descendants of the founders; it has large publishing premises in New York city. Besides books, the firm issues *Harper's Magazine* (monthly, since 1850), *Harper's Weekly* (since 1857), *Harper's Bazar* (fashions, social life, &c.; since 1867), and *Harper's Young People* (since 1881). The firm was reorganised in 1899.

Harper's Ferry, a post-village of West Virginia, situated among beautiful scenery at the confluence of the Shenandoah with the Potomac, where the latter is crossed by a bridge, 81 miles W. of Baltimore by rail. It was the scene of John Brown's abolition raid in 1859; and here a Union army of over 11,500 men, under General D. H. Miles, surrendered to Stonewall Jackson in 1862. The arsenal and armoury were burned in 1861, to prevent their falling into the hands of the Confederates. Pop. 764.

Harpocrates, the name given by Greek writers to the younger Horus, the hieroglyphical inscriptions calling him *Har pa khrut*, 'Horus the child,' the son of Osiris and Isis. See OSIRIS, EGYPT (Vol. IV. p. 235), ISIS.

Harpoon. See WHALE.

Harp-shell (*Harpa*), a genus of gasteropodous molluscs of the whelk family (Buccinidæ), having the last whorl of the shell large, and covered with numerous sharp smooth ribs, resembling the strings of a harp. The foot is large, and there is no operculum. These shells are elegantly marked, and much prized for their beauty. Nine species are known, all of them tropical, and living in deep water, on soft, sandy, or muddy bottoms.



Harp-shell (*Harpa imperialis*).

Harpsichord, a keyed musical instrument, formerly in extensive use, but now little known. There were three shapes: the 'grand' form, resembling a grand piano; the oblong, often called spinet or virginal; and the upright, this type very rare. The sound from the strings was produced by a small piece of crow-quill, or a piece of hard leather, which projected out of a slip of wood, called the jack, that stood upright between the strings, and was pushed upwards by the key, till the quill or leather twitched the string, causing a brilliant, but somewhat harsh sound, entirely deficient of any means of modification in respect to loudness or softness. Specimens of the harpsichord, although now becoming more rare, are still to be found in good preservation, but are regarded rather as articles of vertu or curiosity than as useful musical instruments. Many Italian and Dutch harpsichords were highly ornamented by the most eminent artists with valuable panel paintings on the inside of the lid. The date of the invention of the harpsichord is uncertain. It is first mentioned in the rules of the Minnesingers by Eberhard Cersne, in 1404, which places its invention in the preceding century. It was known in England in the 15th century, as mention occurs of it in a MS. dated 1502, where it is alluded to as no novelty. The Ruckers family were the great makers in Antwerp in the 16th and 17th centuries. In the 18th century Kirkman, and later Broadwood and Shudi, were the famous makers in London. The harpsichord will be remembered in history as the instrument on which Bach and Handel played. After the invention of the pianoforte, the harpsichord in all its varieties was gradually superseded by the new instrument. See PIANOFORTE.

Harpy, a fabulous creature in Greek mythology, considered as a minister of the vengeance of the gods. Various accounts are given of the numbers and parentage of the Harpies. Homer mentions but one, Podarge; Hesiod enumerates two, Aëllo and Okypete, daughters of Thaumas by the Oceanid Electra, fair-haired and winged maidens, very swift of flight. Three are sometimes recognised by later writers, who call them variously daughters of Poseidon or of Typhon, and describe them as hideous monsters with wings, of fierce and loathsome aspect, with their faces pale with hunger, living in an atmosphere of filth and stench, and contaminating everything that they approached. The most celebrated tradition regarding the Harpies is connected with the blind Phineus, whose meals they carried off as soon as they were spread for him, a plague from which he was delivered by the Argonauts, on his engaging to join in their quest. The Boreads Zetes and Calais attacked the Harpies, but spared their lives on their promising to cease from molesting Phineus. Virgil locates them in the Strophades.—A harpy in heraldry is represented as a vulture, with the head and breast of a woman.

Harpy Eagle (*Thrasaëtus harpyia*).

The name harpy is also applied to a raptorial bird of the family Falconidæ (*Thrasaëtus harpyia*), an inhabitant of the great tropical forests, where it preys upon all quadrupeds, except the most powerful, chiefly, however, on monkeys and sloths; even children are said to have been carried off by it. It

is somewhat larger than the golden eagle (measuring 38 inches in length as against 32), and its beak and talons are exceptionally large, giving it a ferocious aspect; but its wings are comparatively short, and its flight, for a hawk, is slow and heavy. Its colour on the back and sides of the neck, on the back and on the wings, is black; the head gray; the front of the neck, breast, and belly white; the tail black and gray above, black and white in transverse bands below. Around the eyes the feathers are disposed in a radiating fashion, and form a crest on the back of its head, increasing the ferocity of its aspect. It inhabits the tropical regions of South America.

Harquebus. See ARQUEBUS.

Harrar. See HARAR.

Harrier, a breed of dog used to hunt the hare by scent. The harrier probably owes its origin to the foxhound, though in some packs the strain has been kept pure for many generations. In appearance the harrier closely resembles the foxhound both in shape and colour, but is on a considerably smaller scale. The harrier, though deficient in speed, is able to hunt a much colder scent than the foxhound. They hunt in packs; and the sport forms an element in English country life similar to foxhunting.

Harrier (*Circus*), a genus of non-arboreal Falconidæ, of slender build, with a somewhat weak, unnotched bill, with soft plumage and a slightly owl-like ruff on the face, with long legs and wings, and a characteristic gliding flight along the ground.

Hen-harrier (*Circus cyaneus*).

They live in the open country, are fond of marshy districts, and dexterously catch frogs, birds, and small mammals. The females are usually larger and darker than the males; the young are like the mother-birds; the nest is almost always on the ground, and the eggs (3 to 5) are white or blotched. The British species of harrier are (1) the Hen-harrier (*C. cyaneus*), almost exterminated in England, but still not uncommon in some parts of Scotland; (2) the Marsh-harrier or Moor-buzzard (*C. æruginosus*), all but exterminated throughout Britain; and (3) Montagu's Harrier (*C. cinerascens*), never more than an occasional visitor. The marsh-harrier is abundant in many parts of North America.

Harriers. See ATHLETIC SPORTS.

Harrington, JAMES, author of the *Oceana*, a celebrated work, half romance, half treatise on political philosophy, written for the purpose of setting forth the best form of government for a commonwealth. The son of Sir S. Harrington of Exton, in Rutlandshire, he was born in January 1611, studied at Oxford under Chillingworth, and then spent some years on the Continent. In 1646, although a republican by conviction, Harrington was appointed one of the personal attendants of Charles I., and on the king's execution accompanied him to the scaffold. It was after this event that the *Oceana* was written; it was published in 1656. The salient points of the political doctrines therein expounded are these: the real basis of power is property, especially landed property; accordingly landed property should be distributed and held in such a way that no one person should derive from it more than a fixed amount of revenue; the rulers of the commonwealth should be changed every three years, their places being taken by others, elected by *ballot*. After the Restoration Harrington was arrested for alleged conspiracy, and during a severe imprisonment lost his reason. He died at Westminster, 11th September 1677. His writings, consisting, besides the *Oceana*, principally of essays, &c. in defence of his *magnum opus*, were first edited by Toland in 1700. The *Oceana* was reprinted by Henry Morley in 1887.

Harrington, SIR JOHN, born in 1561 at his father's seat of Kelston, near Bath, studied at Eton and Christ's College, Cambridge, and afterwards was attached to the court of Queen Elizabeth, who had been his god-mother. His wit brought him into much favour, which he endangered by the freedom and the political allusions of his satires. In 1599 he served under Essex in Ireland, and was knighted by him on the field, much to the queen's displeasure. To fortify his application to King James for the office of Chancellor-archbishop of Ireland he composed, in 1605, *A Short View of the State of Ireland*, a most interesting and singularly modern essay (first edited by Rev. W. Dunn Macray, 1880). He died of dropsy in December 1612. He is now remembered chiefly as the translator of Ariosto's *Orlando Furioso* (1591) into English verse. His other writings were some Rabelaisian pamphlets, a number of fair epigrams, and *A Brief View of the State of the Church*, written for the Prince of Wales.

Harris, in the Hebrides, comprises the southern portion of the island of Lewis and a number of adjacent islets. Pop. 4514. See LEWIS.

Harris, HOWEL, one of the fathers and founders of Welsh Calvinistic Methodism, was born in 1714 at Trevecca, in the county of Brecon. His mind was first seriously awakened to religious questions in 1735, and for seventeen years from that date he spent his time as a lay itinerant preacher, but confined his ministrations for the most part to Wales (see METHODISTS). After his retirement to Trevecca in 1752 he still continued to preach daily at his own home; and in order to accommodate those who came to hear him he built a large house, the inmates of which led a kind of monastic life. Harris died on 21st July 1773. See his *Autobiography* (1791) and W. Williams, *Welsh Calvinistic Methodism* (1872).

Harris, JAMES, a pre-scientific philologist, was born at Salisbury, July 20, 1709. His mother was a sister of the third Earl of Shaftesbury, author of the *Characteristics*. He had his education in his native city and at Wadham College, Oxford, whence he passed to the study of law at Lincoln's Inn. Finding himself at twenty-four on his father's death master of an ample fortune, he devoted himself to the assiduous study of the classics, but in 1761 he entered parliament, and later became Lord of the Admiralty, of the Treasury, and secretary and comptroller to Queen Charlotte. In 1744 he published a volume consisting of three treatises, on art, on music, painting, and poetry, and on happiness; and in 1751 his famous *Hermes*, an

interesting but scarce profitable inquiry into the philosophical basis of universal grammar. His incomplete *Philosophical Arrangements*, a study of the Aristotelian logic, was issued in 1775; and his *Philological Inquiries* on style and the true canons of literary criticism, in three parts—the last written in French (1780–89). He died in December 1780. Harris's works were collected, with a short life, by his son, the first Earl of Malmesbury (2 vols. 4to, 1801; 5 vols. 8vo, 1803).

Harris, JOEL CHANDLER, an American author, was born in Eatonton, Georgia, 8th December 1848, and was in turn printer, lawyer, and journalist. His delightfully original and unexpected book, *Uncle Remus, his Songs and his Sayings: the Folk-lore of the Old Plantation* (New York, 1880), quickly carried his name even to the Old World, at once to children and to scientific students of folklore. Later works are *Nights with Uncle Remus* (Boston, 1883), *Mingo and Other Sketches* (1883), and *Daddy Jake the Runaway, and Short Stories* (1889).

Harris, THOMAS LAKE, founder of the 'Brotherhood of the New Life,' was born at Fenny Stratford, in Buckinghamshire, 15th May 1823, accompanied his father to America, and had in turn been a Universalist pastor, and founded an 'Independent Christian Society,' when in 1850 he was drawn into the spiritualistic movement. He lectured in Great Britain in 1858, and on his return to America reorganised his society as the 'Brotherhood of the New Life.' Property was not held in common, and farming and industrial occupations were engaged in by his followers, numbering at one time about 2000 in America and Great Britain, amongst them Lady Oliphant and her son Laurence Oliphant. Harris was again in Europe in 1866. Latterly he settled in California. His community had no written creed or form of government. Harris acted as the inspired head of the brotherhood, his system combining the doctrines of Swedenborg and of Fourier, while maintaining the authority of the Scriptures and the sacredness of the marriage tie. He also taught that God is two-in-one, infinite in fatherhood and motherhood, and that all who become angels find their counterpart in sex, and are two-in-one to all eternity. Harris has published many works in prose and poetry, amongst which are *Wisdom of Angels* (1856); *Arcana of Christianity* (1857); *Modern Spiritualism* (1860), &c. The influence of the teaching of Harris may be traced in Laurence Oliphant's *Sympneumata* (1885) and his *Scientific Religion* (1888); as also in Pulsford's *Margaroth* (1881). See William Oxley's *Modern Messiahs and Wonder-workers* (1889).

Harrisburg, the capital of Pennsylvania, is situated in the midst of beautiful scenery on the left bank of the Susquehanna River, which is here crossed by several long bridges, 106 miles W. by N. of Philadelphia. It contains the capitol, a court-house, the state arsenal, the state insane asylum, and a Roman Catholic cathedral and some forty other churches. The state library has some 60,000 volumes. The city has a number of blast-furnaces and rolling-mills, and large manufactures of steel and iron, including boilers, machinery, nails, and files; cotton goods, flour, bricks, shoes, brooms, &c. are also produced, and there is a large trade in lumber. Founded in 1785, Harrisburg became the state capital in 1812. Pop. (1870) 23,104; (1880) 30,762; (1890) 39,385.

Harrison, a town of New Jersey, on the Passaic, opposite Newark, with which it is connected by a bridge. It has manufactures of oil-cloth and enamelled cloth, wire, thread, &c. Pop. (1880) 6898; (1890) 8338.

Harrison, BENJAMIN, twenty-third president of the United States, was born at North Bend, Hamilton county, Ohio, August 20, 1833. His father, the third son of President William Henry Harrison, was a small farmer, who, however, managed to educate his nine children; and Harrison, after two years at a school called Farmer's College, near Cincinnati, was transferred to Miami University, at Oxford, Ohio, where he graduated in 1852. In 1854 he settled as a lawyer in Indianapolis, where his first earnings were as a crier of the Federal court. In a short time he was in full practice in all the courts. In 1860 he became candidate for supreme court reporter of Indiana, by nomination of the Republican party, and was elected. Entering the Union army pending the term, the office was declared vacant. In 1864 his party re-elected him with a largely increased majority. He remained in military service, however, and only resumed the reportership upon muster-out at the end of the war. He began his military career in 1862 by raising a company, in which his first commission was of second-lieutenant. He was then made colonel of the 70th Regiment Indiana Volunteers, and ordered to Kentucky. Carrying his studious habits into camp, he became a proficient drill-master. As colonel, sometimes brigade-commander, in the first division 11th Army Corps, he participated in Sherman's Atlanta campaign, distinguishing himself in the battles of Resaca and Peach Tree Creek, and he was in 1865 commissioned brevet-brigadier-general. He also took part in the battle of Nashville, under Thomas, in December 1864.

Copyright 1888 in the U.S. by J. B. Lippincott Company

Returning to the law in Indiana, Harrison declined a third nomination as supreme court reporter. He took an active part in the Grant campaigns of 1868 and 1872, and was nominated for the governorship of the state in 1876; but, though he polled 2000 votes more than the rest of his party, he was defeated. Two years later he presided over the State Convention, and in 1880 he appeared in the Chicago National Convention as chairman of his state delegation. He then declined the use of his name for the presidential nomination; and he afterwards also declined a seat in the cabinet of President Garfield. In 1884 he was again delegate-at-large, and was discussed as a possible nominee for the presidency. In 1880 he was elected United States senator from Indiana; but at the end of his term of six years he was defeated for re-election, and returned to his law office. At the National Republican Convention (1888) in Chicago Harrison received the presidential nomination; President Cleveland being the Democratic nominee. Harrison's election signified the triumph of protection; but in 1892 he was defeated by Mr Cleveland. He was chief counsel for Venezuela in the boundary dispute with British Guiana. See the Life by Lew Wallace (1888), and UNITED STATES, p. 389.

Harrison, FREDERIC, was born in London, October 18, 1831, and was educated at King's College School, London, and Wadham College, Oxford, taking a classical first-class in 1853. He became Fellow and tutor of his college, but was called to the bar in 1858, and thereafter practised conveyancing and in the Courts of Equity. He sat on the Royal Commission upon Trades-unions (1867–69), served as secretary to that for the Digest of the Law (1869–70), and from 1877 till 1889 was professor of Jurisprudence and International Law at Lincoln's Inn Hall. A Positivist in religion and an advanced Liberal in politics, he has argued his opinions in many vigorous and well-written articles in the magazines and reviews, some of which have been reprinted separately. Of his works the chief

are *The Meaning of History* (1862), *Order and Progress* (1875), *Lectures on Education* (1883), *On the Choice of Books* (1886), *Oliver Cromwell* (1888), *The Meaning of History* (1894), *Literary Essays* (1895), *Tennyson, Ruskin, Mill*, &c. (1900). He contested London University in 1886 as a Home-rule candidate, but without success. In 1889–93 he was an alderman in the London County Council.

Harrison, JOHN, the inventor of the chronometer for determining longitude at sea, was born at Foulby, near Pontefract, Yorkshire, in 1693. His mechanical genius, which showed itself at an early age, led him to study the construction of clocks and watches, with a view to diminish as much as possible their errors and irregularities, and by 1726 he had constructed a timekeeper provided with compensating apparatus for correcting errors due to variations of climate. In 1714 the government had offered prizes of £10,000, £15,000, and £20,000 for the discovery of a method for determining the longitude within 60, 40, and 30 miles respectively. After a long period of persevering labour Harrison made a chronometer which, in a voyage to Jamaica in 1761–62, was found to determine the longitude within 18 miles. After another voyage to Jamaica, and further trials, he was awarded the prize of £20,000 in 1765 and 1767. The success of Harrison's chronometer is owing to the application of the compensation curb to the balance wheel; and on the same principle he invented the gridiron pendulum for clocks. Besides these, he invented the going fusee and the remontoir escapement (see HOROLOGY). Harrison died in London, 24th March 1776. He wrote *Description of such Mechanism as will afford a Nice or True Measurement of Times.* See *The Principles of Mr Harrison's Timekeeper* (1767).

Harrison, THOMAS, regicide, was born at Newcastle-under-Lyme in 1606, and joined the parliamentary army at the opening of the Civil War. He commanded the guard that carried the king from Hurst Castle to London, sat among his judges, and signed his death-warrant. He did good service at Worcester, but was too uncompromising alike in religion and politics to favour Cromwell's tolerant ideas, and was accordingly deprived of his commission, and later imprisoned for his share in some of the plots hatched by the more irreconcilable bigots. With characteristically stubborn heroism he would not fly at the Restoration, and was soon seized, tried, and condemned to death. He died bravely, October 13, 1660, with the words on his lips, 'If I had ten thousand lives, I could freely and cheerfully lay them all down to witness to this matter.'

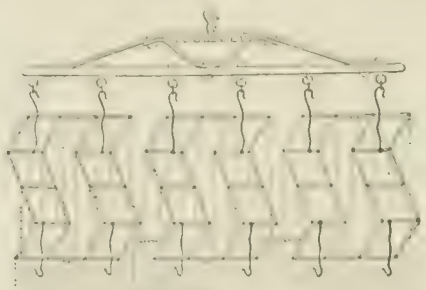
Harrison, WILLIAM, the chief of Holinshed's coadjutors, was born in London, educated at St Paul's and Westminster, and studied first at Oxford, next at Cambridge, graduating B.D. at the latter in 1569. He became household chaplain to William Brooke, Lord Cobham, who presented him to the rectory of Radwinter, in Essex, which he held all his life, together for ten years with the vicarage of Wimbish in the same county. In 1586 he was installed canon of Windsor, and died in 1593. Almost all we know of him he has told us himself, even to his gardening and his brewing; and he impresses his readers throughout as a learned, honest, and singularly open-eyed although untravelled man. When he wrote the book by which his name is remembered one Trinity term in London, he was more than forty miles from his books, and he tells us further that till recently, except in visits to the universities or to Lord Cobham's house in Kent, he had never gone a forty miles' journey in his life. But at that time he had the advantage of access to the valuable manuscripts of Leland. The fruit of his application was his famous *Description of England*, as well as his *Description of Britain*, written for Holinshed's *Chronicle*. In the 'Epistle Dedicatorie' he tells us he had an 'especial eye unto the truth of things;' and further that he was 'the first that hath taken upon him so particularly to describe this Ile of Britain.' The former is especially interesting to us as a vigorous and elaborate account of the conditions of life in the England of Shakespeare's day, treating in succession, with some fullness of detail, subjects so diverse as the church, the bishoprics, the universities, the navy, the food, apparel, armour, the beggars and rogues, laws, punishments, buildings, cities, parks, gardens, fairs, and markets. The second and third books of the *Description of England* were edited by Dr Furnivall, for the New Shakespeare Society (parts i.–iii. 1877–81). The whole work is of course reprinted in all editions of Holinshed.

Harrison, WILLIAM HENRY, ninth president of the United States, was born in Charles City county, Virginia, 9th February 1773. His father, Benjamin Harrison (1740–91), was one of the signers of the declaration of independence, which, as chairman of committee, he reported to congress on 4th July 1776. There is a popular legend, seemingly unfounded, that makes the family descended from Harrison the regicide. After his father's death, William joined the army which Wayne was leading against the North-western Indians, and showed great gallantry at the battle on the Miami (1794). He left the army in 1798. He represented the North-west Territory as a delegate in congress in 1799–1800, and succeeded in passing a valuable law relating to the sale of the federal land in small parcels; and when Indiana Territory was formed (1800), including the present states of Indiana, Illinois, Michigan, and Wisconsin, besides parts of Minnesota and Ohio, he was appointed its governor. He laboured courageously to avert war with the Indians, but was compelled to quell Tecumseh's outbreak, and beat off a fierce and treacherous attack, ending in an important battle at Tippecanoe (7th November 1811). In the war of 1812–14 he was appointed to the chief command in the north-west, repulsed the British force under Proctor, and by the victory of Perry on Lake Erie was enabled to pursue the invaders into Canada, where, on 5th October 1813, he totally routed them in the battle of the Thames. In 1814 he resigned his commission. In 1816 he was elected to congress, and in 1824 became a United States senator. In 1828 he went as ambassador to Colombia, but was recalled in 1829, and for twelve years was clerk of a county court in Ohio. He received 73 electoral votes for the presidency of the United States in 1836 against Van Buren's 170; but four years later, the Whig party having united, he defeated Van Buren, obtaining 234 electoral votes to the latter's 60. The contest is noteworthy as having witnessed the introduction of the enormous mass-meetings and processions, the emblems and banners, that have since been part of every presidential campaign. Harrison died a month after his inauguration, on 4th April 1841, and was succeeded in office by the vice-president, John Tyler.

Harrogate, or HARROWGATE, a watering-place in the West Riding of Yorkshire, lies among the moors, 450 feet above sea-level, and by rail is 17 miles N. of Leeds and 20 WNW. of York. It consists of two parts, High and Low, and is celebrated for its sulphureous, saline, and chalybeate springs. The sulphureous springs are of laxative and diuretic quality, while the chalybeate are tonic. The waters are used both externally and internally, and are in great repute

in many diseases of the skin and in some cases of dyspeptic disorders, scrofula, gout, jaundice, rheumatism, &c. The springs were discovered in 1596. Harrogate is a remarkably healthy place, the death-rate per 1000 ranging in six years between 14·5 and 11·7. It was incorporated as a municipal borough in 1883. Smollett's *Humphrey Clinker* (1771) gives a lively account of Harrogate. Pop. (1851) 3678; (1881) 9482; (1891) 13,917. See Grainge's *History of Harrogate* (1871).

Harrow, an agricultural implement used for smoothing and pulverising ploughed land, and for covering the seeds previously sown. It consists of a frame of a square or rhombic form, in which are fixed rows of teeth, or *tines*, projecting downwards. The harrow is a very ancient implement, having been in use beyond the dawn of history; but as in early times only the lighter soils were cultivated, it often consisted of bushes, or branches of trees, which merely scratched the ground. Subsequently, we find a wooden frame and wooden tines in use; next, the wooden frame with iron tines, a form of the instrument still in use in many parts, especially upon light soils. The harrow constructed wholly of iron is now most largely employed, and as it can be made light or heavy, works more cleanly, and is more durable, it is preferable to the old wooden form. Iron harrows are usually made in zigzag form as shown below. The Howard harrow has the tines so arranged that no one follows in the track of another, but each has a separate line of action which greatly diminishes the risk of any



Howard's Harrow.

portion of the surface escaping pulverisation. Exceptionally strong harrows with rank teeth are made for breaking down rough or hard land. The 'chain-harrow,' which is a congeries of iron rings, is useful for covering grass-seeds, and especially for separating weeds from the earth or clods in which they are enveloped. Drill harrows are constructed to scarify the soil between raised drills and also the raised drills themselves.

Harrow, or HARROW-ON-THE-HILL, a town of Middlesex, 11½ miles WNW. of St Paul's, stands on a hill, 200 feet high, that looks over thirteen shires. Its 'visible church,' which crowns the hill-top, was founded by Lanfranc, and rebuilt about the middle of the 14th century. Exhibiting every style of Gothic architecture, from Norman to Perpendicular, it has a lofty spire and eleven brasses (one of them to John Lyon); whilst in the churchyard is a flat tombstone on which Byron as a schoolboy used to lie. Pop. (1881) 5558; (1891) 5725. The district has increased even more rapidly (from 12,796 to 15,710), owing largely to building operations and to the railway improvements.

HARROW SCHOOL was founded in 1571 by John Lyon, a wealthy yeoman of Preston, in the parish of Harrow-on-the-Hill, who died in 1592; but the original red-brick school-house (now the name-becarved Fourth Form School) was not built till 1608–15. New buildings have been added since 1819—the chief of these being the Second-pointed chapel (1857), with its tall slender spire and memorial glass to twenty-two Crimean officers; the Vaughan Memorial Library (1863), similarly designed by Sir G. G. Scott; and the semi-circular Speech-room (1877). The school was primarily intended to afford a free education to thirty poor boys of the parish; but the statutes, drawn up by the founder two years before his death, provided also for the admission of 'so many foreigners as the place can conveniently contain;' and it is to that provision that Harrow, although not richly endowed, owes its proud position among the great schools of England. Still, its fortunes have fluctuated much, the number of boys being 144 in 1721, 50 in 1745, 345 in 1803, 80 in 1845, 438 in 1859, and now upwards of 500. The study of mathematics was first introduced in 1837, of modern languages in 1851–55; and all the other branches of a modern education have followed. Music became a specialty of Harrow education under Mr J. Farmer, who was music master here from 1862 till 1885. Archery, which flourished till 1776, has been superseded by cricket, football, rackets, &c., the Eton and Harrow cricket-match at Lord's dating from 1818. The age of admission is twelve to fourteen; and there are six or seven entrance scholarships, of from £30 to £80 per annum, offered every Easter. Of leaving scholarships, the most valuable are Baring's three of £100 a year for five years to Hertford College, Oxford. Under the Public Schools Act of 1868 the governing body comprises six members, elected respectively by the Lord Chancellor, the universities of Oxford, Cambridge, and London, the Royal Society, and the under-masters. Among the twenty-one head-masters have been Archdeacon Thackeray (1746–60), Dr Sumner (1760–71), Dean George Butler (1805–29), Archbishop Longley (1829–36), Bishop Christopher Wordsworth (1836–44), Dean Vaughan (1844–59), Dr Henry Montagu Butler (1859–85), and the Rev. J. E. C. Welldon. Of illustrious Harrovians may be mentioned Lord Aberdeen, Bruce the Abyssinian, Charles Buller, Colonel Burnaby, Lord Byron, Charles Stuart Calverley, the Marquis of Dalhousie, Lord Dalling, Lord Goderich, the Marquis of Hastings, Lord Herbert of Lea, Theodore Hook, Sir William Jones, Cardinal Manning, Hermann Merivale, Dean Merivale, Lord Palmerston, Dr Samuel Parr (a native also, and an under-master), Sir Robert Peel, Spencer Perceval, Admiral Rodney, Lord Shaftesbury, Sheridan, J. S. Symonds, Archbishop Trench, Anthony Trollope, and Sir George Trevelyan. 'Stet fortuna domus.'

Harry, BLIND, a Scottish minstrel of the 15th century. Scarcely anything is known of his life beyond what is told by John Major (or Mair) in his *History of Scotland*, published in 1521. 'When I was a child,' he says, 'Henry, a man blind from his birth, who lived by telling tales before princes and peers, wrote a whole book of William Wallace, weaving the common stories (which I, for one, only partly believe) into vernacular poetry, in which he was skilled.' In 1490–92 Blind Harry is found at the court of King James IV., receiving occasional gratuities of five, nine, and eighteen shillings. The poem attributed to him, *The Life of that Noble Champion of Scotland, Sir William Wallace, Knight*, was completed before the end of the year 1488, when it was copied by John Ramsay. This copy, the oldest MS. of the work now known to

exist, does not ascribe it to Blind Harry, nor is his name given to it in the earlier printed editions. The poem, which contains 11,861 lines, of ten syllables each, is written in rhyming couplets. The language is frequently obscure, and sometimes unintelligible, but the work as a whole is written with vigour; in some passages it kindles into poetry; and it is altogether a surprising performance, if we regard it as the composition of one who was born blind. The author seems to have been familiar with the metrical romances which were the popular literature of the time, and, though his poem has no claim to be regarded as history, he makes frequent references to original authorities which form the main groundwork of the narrative. He represents himself as deeply indebted to the life of the great Scottish patriot, written in Latin by his schoolfellow Master John Blair, the chaplain of Wallace, and to another by Sir Thomas Gray, the parson of Liberton. The poem was at one time regarded as wholly a work of fiction, but authentic documents recently brought to light have shown that though it contains a great number of mistakes or misrepresentations of well-known facts, it is on the whole a valuable and in not a few incidents a trustworthy narrative. The work is believed to have been printed in the Scottish capital as early as 1520, but no perfect copy is known to be preserved of any earlier edition than that of Edinburgh in 1570, bearing the title of *The Actis and Deidis of the Maist Illuster and Vailyeand Campioun Schir William Wallace, Knicht of Ellerslie*. The work was reprinted at Edinburgh in 1594, 1601, 1620, 1648, 1673, and 1758; at Glasgow, in 1665 and 1699; also at Aberdeen and at Perth. Good editions are that by Jamieson (Edinburgh, 1820, 4to) and that by Moir for the Scottish Text Society (1885–89). The work was for about 200 years one of the most popular in Scotland, but gradually fell into neglect as its language, never very plain, ceased to be understood except by scholars. Its place was supplied by a modernised version by William Hamilton of Gilbertfield, published at Glasgow in 1722, with the title of *A New Edition of the Life and Heroic Actions of the Renoun'd Sir William Wallace*. This is a poor performance, but it continued to be widely circulated among the Scottish people almost to our own day.

Hart, the name given to the stag or male deer, from the age of six years, when the crown or surroyal antler begins to appear.

Hart, Solomon Alexander, painter, was born at Plymouth, in April 1806, the son of a Jewish goldsmith, who in 1820 removed to London. Apprenticed first to a line engraver, in 1823 young Hart became a student at the Royal Academy. Amongst his works are 'The Elevation of the Law' (1830), 'Isaac of York' (1830), 'English Nobility receiving the Communion' (1831), 'Henry I. receiving Intelligence of the Death of his Son' (1840), 'Milton visiting Galileo in Prison' (1847), 'The Three Inventors of Printing' (1852), &c. He also painted miniatures and portraits. In 1840 Hart became R.A., in 1854 professor of Painting, and in 1865 librarian of the Royal Academy. He died in London, 11th June 1881.

Harte, Francis Bret, was born in Albany, New York, August 25, 1839. His father, a teacher in the Female Seminary, died early, and the boy received only a common school education. He went to California with his mother in 1854, and opened a school at Sonora; but he was not successful in this, nor in mining, which he tried afterwards. He next became a compositor, and in 1857 obtained employment in the office of the *Golden Era*, in San Francisco. His experiences among miners and the rough population that were attracted by the 'gold-craze' had made a powerful impression upon his mind, and his first literary efforts were sketches of the people and the scenes he had observed. These sketches attracted much attention, and as a result the author became one of the staff of the paper. His *Condensed Novels* afterwards appeared in another weekly, the *Californian*. He was secretary of the United States Mint in San Francisco from 1864 to 1870, and during this period wrote some of his most famous poems, among them 'John Burns of Gettysburg,' 'The Society upon the Stanislau,' &c. He founded in 1868 and edited the *Overland Monthly*, to which he contributed *The Luck of Roaring Camp*, *The Outcasts of Poker Flat*, *Miggles*, *Tennessee's Partner*, *The Idyl of Red Gulch*, and *Plain Language from Truthful James* ('The Heathen Chinee'). Returning to the East, he became a contributor to the *Atlantic Monthly*, and from time to time delivered lectures in various cities upon the pioneers of California. In 1878 he received the appointment of United States consul at Crefeld. After two years he was transferred to Glasgow, and held that post until 1885. Since that time he has resided in London, and devoted himself to literary pursuits.

Copyright 1890 in U.S. by J. B. Lippincott Company.

Bret Harte has been a prolific writer, and almost everything from his pen bears the stamp of his original genius. This, however, is truer of the early and middle period than of the later. Generally, he is strongest in the field of which he was the discoverer; although in some instances—notably in *Thankful Blossom*—he has produced exquisite romances, sometimes with a pastoral flavour, wholly unlike the turbulence of the first efforts.

The mixture of southern and western people in the early rush to the goldfields seems to have produced a new dialect, but it probably had a brief existence. At least, it would be wrong to suppose that the peculiar phrases in the mining sketches (so picturesque and shocking at once) are part of the daily talk of the people to-day. But the dialect was not all. Harte has described or invented new types of character, and has portrayed them and their surroundings with a vivid energy that has no modern counterpart. It is difficult to say whether he has been more successful in poetry or in prose; for the same virile power appears in both, and he has evidently by nature a strong sense of melody and great facility in verse. In 'John Burns of Gettysburg' and 'Dickens in Camp' there is evidence that he might have taken a higher place among poets if he had devoted himself to serious work. But his instinct has been his guide, and has led him in the path of fame. It must be remembered that he acquired the art of effective writing by practice, without previous discipline, and that for him there was no model. Since he has shown the way, not a few have followed him—afar.

His *Complete Works*, collected and revised by himself, appeared in London in 5 vols. in 1881. Since then his publications have included *Flip* (1882); *In the Carquinez Woods* (1883); *By Shore and Sedge* (1885); *Snowbound at Eagle's* (1886); *A Phyllis of the Sierras* and *A Drift from Redwood Camp* (1888); *Cressy* (1889); *The Heritage of Dedlow Marsh* (1889); *A Waif of the Plains* (1890); *A Ward of the Golden Gate* (1890); *A Sappho of Green Springs* (1892); *Sally Dows* (1892); *Susy* (1893); *The Bell-Ringer of Angel's* (1894); and *Clarence* (1895).

Hartebeest. See Antelope.

Hartford, the capital of Connecticut, is situated on the right bank of the Connecticut River, 50 miles from its mouth, and 112 by rail NE. of New York, with which it is also in daily communication by steamboat. It is a handsome city, with streets not all too regular, and many tasteful private houses. It has an imposing state capitol of white

marble, a state arsenal, a new post-office and United States court house; and on the outskirts are the new buildings of Trinity College (Episcopal), which was founded on the present site of the capitol in 1823 (see GLENALMOND). To the notable public buildings, besides the Wadsworth Athenæum and the high school, must be added the substantial offices of the many great insurance companies whose headquarters are established here, as well as a number of banks. Hartford contains a Congregational theological seminary, a large hospital, asylums for orphans, the deaf and dumb, and the insane, and possesses several important libraries; it is the seat of a Roman Catholic bishop also, and has two nunneries. There are extensive manufactures of Colt's pistols, Gatling guns, engines, boilers, and machines, hardware and other metal goods, stoneware, and wooden wares. There is also some publishing, and a very considerable trade in Connecticut tobacco. The site of a Dutch fort in 1633, and of a colony of Massachusetts settlers as early as 1635–36, Hartford was incorporated as a city in 1784, and has been sole capital of the state since 1873. It was the seat of the Hartford Convention (q.v.). See also CONNECTICUT. In point of population the city stands second to New Haven, which formerly shared with Hartford the rank of semi-capital. Pop. (1870) 37,180; (1880) 42,015; (1890) 53,230. See *The River Towns of Connecticut*, by C. M. Andrews (Johns Hopkins University Studies, 1889).

HARTFORD CONVENTION, in the political history of the United States, was an assemblage of delegates from the New England States, at Hartford, Connecticut, December 15, 1814. This convention was proposed by the Massachusetts legislature. The war with Great Britain in 1812–14 had been from the first opposed by the majority of the people of New England, who were Federalists, and looked upon the war as a mere party measure of the Democrats; and in face of the destruction of the commerce and the fisheries, the chief interests of New England, this convention was called with the ostensible object of devising means of security and defence. It sat twenty days with closed doors, and, as it was supposed to be of a treasonable character, it was watched by a military officer of the government. The convention prepared a report recommending the adoption of measures by the state legislatures that would protect their citizens from conscriptions and impressments, and the militia from forcible drafts; the report also proposed certain amendments to the federal constitution. No treasonable act was committed, and no treasonable intention proved; yet the suspicion of disloyal tendencies clung to the convention, and completed the ruin of the Federalist party, which did not survive the election of 1816. Some ground for the public suspicion was probably afforded by the fact that a section of the Federalist leaders known as the 'Essex Junto,' who had in 1804 and 1809 seriously discussed the question of dissolving the Union and forming an Eastern confederacy, were foremost in bringing the convention about; and the charge of aiming at a kingdom of New England would therefore make no serious demand upon the credulity of partisan opponents. Yet the convention included men of the highest public character, who strenuously defended the pure purpose of its patriotism, and the charges of treasonable designs are now nearly universally regarded as baseless.

Hartington, LORD. See CAVENDISH.

Hartlepool, a municipal borough and seaport in the county of Durham, is situated on a small peninsula north of the estuary of the Tees, 12 miles NNE. of Stockton, and 18 ESE. of Durham. It formerly attracted many visitors for sea-bathing during the summer months; but, owing to the formation of railways connecting it with the Durham coal-mines, it is no longer visited for that purpose. Its ancient sea-fishing industry is retained, and has recently extended in consequence of the demand from Yorkshire. It is the only borough in the county founded by royal charter whose charter is extant. In the 13th century Hartlepool belonged to the Bruces of Annandale in Scotland, progenitors of the royal family of that name. After Bruce ascended the Scottish throne his English possessions were forfeited, and Hartlepool was granted to the Cliffords. The boundaries of the ancient borough were in 1883 extended so as to include the township of Throston and part of the township of Stranton, making the southern boundary conterminous with the modern borough of West Hartlepool. The local industries of Hartlepool are iron shipbuilding, marine engineering, and cement-manufacture. Formerly there was a considerable shipping trade, but that is now almost entirely transferred to West Hartlepool, where the chief custom-house and other facilities are situated. The harbour entrance is safe, and communicates by a channel direct to the more modern port. The public institutions include excellent public schools, a public hospital, an ancient parish church, and thirteen other places of worship. A substantial sea-wall and delightful promenade, completed in 1889, have added much to the attractive appearance of the town on the seaward side. Pop. of municipal borough (1851) 9503; (1871) 13,166; (1881) 16,998; (1891) 21,521.

WEST HARTLEPOOL, a modern municipal borough and seaport, is situated to the south as Hartlepool is to the north of Hartlepool Bay, and practically forms one town with Hartlepool. It was founded in 1847 by Ralph Ward Jackson, an enterprising railway speculator, afterwards M.P. for the Hartlepools. It possesses a theatre, athenæum, and mechanics' institute, custom-house, market-house, exchange, a municipal hall opened by Prince Albert Victor in 1889, a school of art, and other public buildings. The first harbour was constructed here in 1847, of 12 acres, and has since been greatly enlarged. The dock area of Hartlepool and West Hartlepool together, including the timber and shipbuilding yards, &c., is over 300 acres in extent. Extensive iron shipbuilding-yards, cement-works, wood-pulp works, and marine engine-building establishments have been founded. There are graving-docks leased by the North-Eastern Railway Company, and also one extensive graving-dock open to public use. Besides coal, the following are the principal imports: Flax and hemp, grain, timber, butter, cheese, fruit, cattle, tallow, yeast, iron, zinc, &c. The exports consist of woollen and cotton goods, copper, cement, drugs, machinery, earthenware, yarn, hides, &c.; the trade being carried on for the most part with the Baltic ports, Cronstadt, St Petersburg, and Danzig, and with Hamburg and Rotterdam. The export of coal from the united port is about 1,500,000 tons annually. Governed from 1854 by a local commission, the town was created a municipal borough in 1887. Pop. of municipal district (1861) 12,603; (1881) 28,167; of municipal borough (1891) 42,492. In 1867 'The Hartlepools' were constituted a parliamentary borough, returning one member. Pop. 46,990. See Sir C. Sharpe's *History of Hartlepool* (1816; new ed. 1851).

Hartley, DAVID, philosopher, was born August 30, 1705. His father was vicar of Armley, in Yorkshire. At fifteen he entered Jesus College, Cambridge, and became a Fellow of the college. He studied at first for the church, but, dissenting from some points in the Thirty-nine Articles, he abandoned his original intention. In his mature years

he impugned the eternity of hell-punishment, maintaining the ultimate restoration of the lost; in all other points his published opinions coincided with the Church of England, and he continued to the last a member of the church. He finally chose the profession of medicine, in which he attained considerable eminence. He practised as a physician successively at Newark, Bury St Edmunds, in London, and at Bath, where he died on the 25th of August 1757, at the age of fifty-two.

His work on the mind, entitled *Observations on Man* (1749), on which his fame rests, was begun when he was about twenty-five, and occupied his thoughts for sixteen years. The first part relates to the constitution of the human mind; the second treats of religion and morals. His handling of the mind turns throughout upon two theories or hypotheses, which have very different merits. The first is called the Doctrine of Vibrations, or a theory of nervous action analogous to the propagation of sound, the suggestion of which he owed to Newton, of whose writings he was a devoted student. His second and most valuable innovation consisted in showing that the faculties, powers, and feelings of the mind might be explained to a very wide extent by the principle of the Association of Ideas (q.v.); and it should be said that he was certainly the first to do justice to the applications of that principle to explain the phenomena of the mind.

The doctrine of vibrations supposed that when any one of the senses is affected by an outward object the effect was to set the particles of the nerve in a vibratory motion, which ran along to the brain, and produced corresponding vibrations in the cerebral substance. In like manner, when an active impulse proceeded outwards to the muscles the manner of communication along the nerves was of the same kind. He even extended these molecular vibrations to the other tissues. The dislike generally entertained towards this part of Hartley's speculations arose from a mistaken notion of its involving or favouring materialism. See G. S. Bower, *Hartley and James Mill* (1881).

Hartlib, SAMUEL, was born about 1600 at Elbing, in Prussia, son of a Polish refugee and an English mother. Coming to England about 1628, he busied himself in trade, later in agriculture, and, when he had exhausted his fortune in his experiments, projected a school to be conducted on new principles. It is highly probable that his idea inspired his friend Milton's famous *Tractate on Education*, addressed to Hartlib in 1644, as well as Sir William Petty's *Two Letters* (1647 and 1648). He was granted by Cromwell a pension of £100, increased later to £300, which after the Restoration he petitioned parliament to renew. No letters of Hartlib's are extant posterior to 1662. He wrote on education and on husbandry. See *Biographical Memoir of Samuel Hartlib* by H. Dircks (1865).

Hartmann, KARL ROBERT EDUARD VON, German philosopher, born at Berlin on 23d February 1842. From 1858 to 1865 he served as an artillery officer in the Prussian guards, but was compelled to abandon his calling owing to an affection of the knee. Since 1867 he has lived in Berlin, busied with the elaboration of a comprehensive system of philosophy. His activity may be divided into two periods; in the first, from 1868 to 1877, he was chiefly working out his ideas on methodology, the philosophy of the natural sciences, psychology, metaphysics, and the theory of knowledge (*Erkenntnisstheorie*); in the latter, from 1878 onwards, he has been chiefly concerned with ethics, the philosophy of religion, and æsthetics. His system is a synthesis of Hegel's and Schopenhauer's systems, which he has reduced, by means of Schelling's conception of the Unconscious and his doctrine of principles, to a concrete monism; and his substructure is built upon an empirical basis with the aid of the inductive methods employed in the natural sciences and history. In his own words—'As I have followed Schelling's precedent in uniting Hegel's one-sided identification of the world's substance with the logical Idea with Schopenhauer's similarly one-sided identification of it with Will, so I have also endeavoured to effect a higher unity between Hegel's coldness and want of feeling, whereby the individual is degraded to an insensitive instrument of the Idea, with whose fate, with whose weal or woe, philosophy does not concern itself, and Schopenhauer's lack of interest in the process of the All, and his insistence on the redemption of self from an individual existence of pain as the sole end of life. In a similar manner I have corrected Hegel's idea of the philosophy of religion. He has endeavoured to interpret Christianity in a false and unhistorical manner, in that speculatively he makes it the absolute religion of the intellect (*Geist*). This faulty conception I have amended with certain elements of thought derived from Schopenhauer, to wit, a recognition of the deep and peculiar significance of the Indian religions, of which Hegel had no comprehension and with which he had consequently no sympathy. In my ethics I have assigned to Schopenhauer's emotion morality its proper place beside Hegel's intellectual morality, and have linked Hegel's demand for the subordination of the individual to the teleological end of the absolute Idea to Schopenhauer's conception that the ethical subordination of the individual is conditioned by the unity of substance which obtains between all separate individualities and the one world-substance. But in all these departments of thinking the richer and more important factors were contributed by Hegel's philosophy, whilst Schopenhauer's less elaborated system furnished me with complementary elements. In æsthetics the only thing I had to do in principle was to emphasise still more sharply than Hegel himself has done the antithesis between his concrete idealism and the abstract idealism of Schelling and of Schopenhauer.'

The great aim Ed. von Hartmann has set before himself is that of harmonising and reconciling philosophy with science, by gathering up the varied results of modern scientific investigation into an all-comprehensive philosophic conception of the world (*Weltanschauung*). His speculative system is commonly believed to be pessimistic in temper; but that is not the case. The Unconscious (the universal monistic principle) is both real and ideal, both will and presentation—the substantial and intelligent principles respectively. And the world-process, instead of being negative, is a process of evolutionary optimism. The substantial principle involves intrinsically an excess of pain over pleasure in the world; and this excess of pain can only be abolished by the annihilation of the substantial principle, Will, and its specific energy, willing, not, however, in individual beings, but once for all universally. The agency by which this 'best possible' consummation is to be achieved is the intellectual principle, working through its own creations, consciousness and individuality, along the lines of progressional development. And this strikes the keynote of the philosophic temper in which Von Hartmann writes. He is an ardent champion of evolutionary progress, a believer in the mission of western energy and enlightenment, and in its teleological justification, an admirer of the modern spirit of enterprise, its robust vigour, its keen delight in struggle and conflict, and its restless practical activity. Hence he proclaims himself as opposed to the teaching and attitude of the prophets of the *Weltschmerz;* hence he condemns the temper of oriental passivity, the unmanly fashion of

cowering and shivering before the March blasts of misery, and despises that 'weariness ere eventide' which is now become so common amongst us.

Ed. von Hartmann also gives close attention to the public questions of the day in Germany, and writes ably and clearly on such matters as education, politics, &c. The results of his activity in these departments will be found in *Zur Reform des höheren Schulwesens* (1875), *Die politischen Aufgaben und Zustände des Deutschen Reichs* (1881), *Moderne Probleme* (1885), *Gesammelte Studien und Aufsätze* (1876) this last containing an autobiography and *Zwei Jahrzehnte Deutscher Politik* (1889), besides numerous contributions to magazines, such as *Die Gegenwart*, &c.

The books in which his philosophical creed is laid down bear the following titles: *Philosophie des Unbewussten* (1869; 10th ed. 1890; Eng. trans. by Coupland, 1884); *Phänomenologie des sittlichen Bewusstseins* (1878; 2d ed. 1886); *Das religiöse Bewusstsein der Menschheit im Stufengang seiner Entwickelung* (1882); *Die Religion des Geistes* (1882); *Die Deutsche Aesthetik seit Kant* (1886); and *Die Philosophie des Schönen* (1887). Besides these, he has written several books supplementary to his principal lines of thought, such as *Kritische Grundlegung des transscendentalen Realismus* (3d ed. 1885); *Neukantianismus, Schopenhauerianismus, und Hegelianismus* (2d ed. 1878); *Die Selbstzersetzung des Christentums und die Religion der Zukunft* (2d ed. 1874; Eng. trans. by Dore, 1885); a work on the theory of knowledge (1889); *Kritische Wanderungen durch die Philosophie der Gegenwart* (1890), &c. Useful helps to the study of his system are Koeber's excellent condensation, *Das philosophische System H. von Hartmanns* (1884), and Plumacher's *Der Pessimismus in Vergangenheit und Gegenwart* (1884).

Hartmann von Aue ranks next after Wolfram von Eschenbach and Gottfried von Strasburg as a poet of the Middle High German period. He was born about 1170, of a noble Swabian family, took part in the Crusade of 1187, and died between 1210 and 1220. His writings consist of narrative poems and songs. The most popular of the former is *Der arme Heinrich*, based upon a Swabian traditionary story. *Erec*, which relates the legend reproduced in Tennyson's 'Enid' in *Idylls of the King*, and *Iwein*, are both drawn from the Arthurian cycle, and closely follow French poems by Chrestien de Troyes. In *Gregor vom Stein*, the plot of which is of a repulsive nature, Hartmann depicts worldly passion subdued and purified by the power of religious faith, the faith of the ascetic of the church at that date. The songs belong to the erotic class and are marked by freshness and naïveté. His longer works have each been edited several times separately. F. Bech published a critical edition of Hartmann's collected writings in 1866-69 (2d ed. 1870–73).

Hartshorn, the term given in pharmacy to the antlers of the Red Deer or *Cervus elaphus*. Its composition is very different from that of persistent horns, as those of the ox, for example, and is identical, or nearly so, with that of bone. The products of its distillation, containing among other things, ammonia, were formerly much used in medicine, under the titles of oil of hartshorn, volatile salt of hartshorn, spirits of hartshorn, &c.; but they are now replaced by a solution of ammonia and carbonate of ammonia, the sal volatile of the shops. See AMMONIA, LINIMENTS.

Hart's-tongue (*Scolopendrium*), a genus of widely distributed ferns, of which one species, *S. vulgare*, is a native of Britain, and is common in many parts of the country, in moist woods, shady banks, caves on the seashore, and other cold and damp situations. Its fronds are in general undivided although sometimes forked from a few inches to 2 feet in length, and from 1 to 3 inches in breadth. The *sori* are in transverse lines on the lateral veins. Fine plants of this fern are very

Hart's tongue (*Scolopendrium vulgare*).

ornamental, and attain their greatest luxuriance in winter.

Hartz. See HARZ.

Hartzenbusch, JUAN EUGENIO, a Spanish dramatic poet of German extraction, was born at Madrid, September 6, 1806, studied under the Jesuits, and produced his first book, the drama *Amantes de Teruel*, in 1836. His principal works, all published at Madrid, are the drama *Doña Mencia* (1838), the comedies *La Redoma Encantada* (1839) and *La Visionaria* (1840), and the dramatic poems *Alfonso el Casto* (1841), *El Bachiller Mendarias* (1842), *La Coja y el Encogido* (1843), and others. He also published in prose *Cuentos y Fabulas* (1861), *Obras Escogidas* (1865), and *Obras de Encargo* (1864). His writings are characterised by glowing imagination, vigorous diction, and sonorous versification. Besides his original works he issued good critical editions of the plays of Tirso de Molina, Calderon, and Lope de Vega. During the greater part of his life Hartzenbusch was employed in the national library at Madrid, of which he became director in 1862. He died at Madrid, 3d August 1880.

Hârûn. See HAROUN.

Haruspices (Sanskrit *hirâ*, 'entrails;' cf. Gr. *chordē, cholades*), soothsayers or diviners among the Etruscans, and from them adopted by the Romans, who foretold future events from the inspection of the entrails of animals offered in sacrifice (hence also called *extispices*), and from the observation of other circumstances connected with the offerings, such as the willingness or unwillingness of the victim to come to the altar, and the flame or the smoke. They took indications also from earthquakes, lightning, and all other extraordinary phenomena of nature called *portenta*. The haruspices did not equal the augurs in dignity and respect; they were regarded rather as mediums of communication with heaven than as possessing any independent religious authority. They had no organisation like the augurs; they did not, in earlier times at least, form a *collegium*, nor had they a *magister*. Their art fell latterly into disrepute, as is illustrated by the well-known saying of Cato that 'he wondered that one haruspex did not laugh when he saw another.' See AUGURIES, and DIVINATION.

Harvard University, founded as a college in 1638, is the oldest, richest, and best equipped of the institutions of learning in the United States. It is located at Cambridge (q.v.), Massachusetts, and its numerous buildings (nearly fifty) are the chief features of the town. It was named in honour of the Rev. John Harvard, who was probably born in Southwark in 1607, graduated in 1635 at Emmanuel College, Cambridge, came to New England

Copyright 1890 in U.S. by J. B. Lippincott Company

in 1637, and, dying in 1638, bequeathed to the proposed college his library of over 300 volumes and £779. During the colonial period the avowed object of Harvard College was 'the education of the English and Indian youth in knowledge and godliness,' mainly with a view to their entering the Puritan ministry: only one Indian ever graduated (in 1665). In its infancy the college was supported by voluntary contributions from the churches, and by grants from the Massachusetts colony, but for a long time it was a rather obscure and feeble school. Its expansion into a university, its deliverance from sectarian control, and its independence from the state have been accomplished during the 19th century. During the same period its resources have enormously increased, and almost wholly from private donations. It was mainly under the rule of the state until 1865, when by statute the government was vested in a board of thirty overseers, in six classes of five members each, chosen by the alumni; one class being renewed annually. The overseers direct the courses of study and general management, but the nominations of professors and other officers are made by the 'corporation,' consisting of the president and five fellows, a self-perpetuating body, originally created by charter in 1650, and holding all the property of the university as trustees. The nominations made by the 'corporation' require confirmation by the overseers.

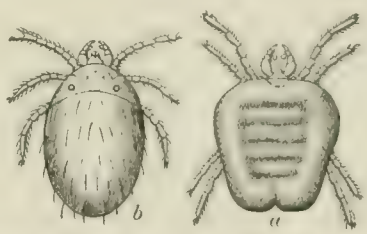
The halls for 'recitations' and lectures, and for students' lodgings, as also the chapel, library, and law-school, are in a square called the college yard, containing about 15 acres, planted with beautiful elms. The other buildings are in other parts of the town, not far distant, and occupy about 60 acres. The Agassiz museum of comparative zoology is world-famous. The Peabody museum of American archæology and ethnology dates from 1866; and in 1890 a sum of $50,000 was given to found a museum of Semitic antiquities. The most imposing edifice is Memorial Hall, built in honour of the alumni who fell during the civil war. It is 310 feet in length, and 115 in breadth, and has a tower 200 feet high. An ample vestibule contains busts and mural tablets. The principal hall is 164 by 60 feet, and 80 feet to the ceiling. This has a fine collection of historical portraits. It is used as a dining-hall, and accommodates nearly 700 at table. At the eastern end is a beautiful theatre for public exercises on ceremonial occasions. Memorial Hall, built of brick and freestone, in Norman style, richly ornamented, needs only the mellowing touch of age to be one of the most impressive collegiate buildings in the world.

In the academic department the requirements for admission are high, and as a consequence few students enter before the age of eighteen. There is a choice of two lines of study, both including ancient classics, mathematics, and other sciences; but in one line the classics are prominent, in the other the sciences. There are also various minor elections of study; but no degree is given without some full course, thoroughly carried out. As the university is amply endowed, there are many scholarships in all the departments, besides prizes and aids of many sorts, amounting to about $45,000 per annum. Morning prayers are conducted by clergymen of different denominations in turn; and students must attend Sunday services at the church designated by their parents. The general library contains above 250,000 volumes; and other libraries raise the total to 360,000 volumes. There is a well-equipped observatory, besides a botanic garden and an arboretum. There are no fees payable to professors; each student on matriculation pays a general fee, and may attend as many courses as he elects. Expenses vary with the habits of the student, but necessary expenses need not exceed $1000 (£200) per annum.

The following are the departments included in the university: Harvard College, the Divinity School, the Law School, the Lawrence Scientific School, the Medical School, the Dental School (in Boston), the Bussey Institution (a school of agriculture), the School of Veterinary Medicine (in Boston), and the Graduate Department. Further, Radcliffe College (formerly called Harvard Annex) was organised in 1879 for the collegiate instruction of women by professors and instructors of Harvard; a four years' course preparing for a certificate corresponding to the B.A. degree. The total strength of the teaching staff in 1895 was close on 300 (about 100 being professors proper), and of the students near 3000, of whom 1700 were at the college — the others being at the various other connected institutes or departments. The total income is considerably more than $1,000,000 a year; the invested funds (exclusive of lands, buildings, books, and apparatus) amount to about $8,500,000. Though wholly unsectarian, the college has largely been in the hands of Unitarians. Amongst the alumni have been the Adamses, the Danas, Channing, Theo. Parker, Motley, Prescott, Bancroft, Emerson, Wendell Phillips, O. Wendell Holmes, Parkman, Lowell, Child, and Norton.

See J. Quincy, *History of Harvard University* (1860); Rendle's monograph on John Harvard (1885); Thayer, *An Historical Sketch of Harvard University* (1891); *Four American Colleges* (1895); Birkbeck Hill, *Harvard College, by an Oxonian* (1895).

Harvest-bug, the larval form of the silky Trombidium (*Trombidium holosericeum*—Linn.) of the family Trombidiidæ, order Acarina. It is of minute size, scarcely discernible by the naked eye, and of a bright scarlet or vivid crimson colour. In the hot months of summer it is found in gardens



a, *Trombidium holosericeum*, female (mag. 9 diameters); *b*, larva, full grown (Harvest-bug).

and on wild vegetation, being most plentiful in hot dry seasons in places near the sea and in chalky districts. It specially torments people with delicate skins, and the wound it produces causes a good deal of local irritation and also, in warmer countries, a considerable amount of constitutional disturbance. The most unpleasant symptoms are only observed in climates warmer than Britain; but the mite is troublesome enough in some parts of Scotland. M. P. Mégnin has investigated the life-history of the harvest-bug, or *rouget*, as it is called in France (see *Annales des Sciences Naturelles*, 6th series, vol. iv. 1876). He found the silky Trombidium (*T. holosericeum*), a bright scarlet species, from spring till July and August, when it suddenly disappeared. In April he found some males with many young females, in the end of May and in June only gravid females. In June and July eggs were laid, which hatched, producing the *rouget* or harvest-bug formerly described as *Leptus autumnalis*, an almost spherical six-legged larva, which soon found a host into whose skin it thrust its sharp mandibles. Forthwith its abdomen began to swell with the fluid imbibed, reaching ultimately

to about five times its original bulk, the head and thorax remaining of the same size as before. After hibernation, during which it digested and assimilated the nutritive juices stored up during its parasitic existence, it became the eight-legged nympha, exclusively a vegetable feeder and sexually complete. The harvest-bug infests not only human beings, but also dogs, cats, hares, and other smaller mammals, and even insects. The remedy employed for its bite is to extract the animal from the skin by means of a needle, and to allay the itching by rubbing the part affected with some essential oil. The ravages of the harvest-bug appear to be not confined to Europe, since a small animal found in Mexico, and called by the Indians *Thalsahuate*, seems to be, if not identical with, at least similar to the harvest-bug in its processes and effects.

Harvest-fly, the popular name in the United States for a species of Cicada (q.v.).

Harvest-moon. See Moon.

Harvey, Sir George, P.R.S.A., was born at St Ninians, near Stirling, in February 1806. He was apprenticed to a bookseller in Stirling, but in 1823 removed to Edinburgh, and entered the Trustees' Academy there. In 1826, when the Royal Scottish Academy was instituted, he was elected an Associate, though only in his twentieth year; he became a full Academician in 1829, president in 1864, and was knighted in 1867. He died 22d January 1876. Many of his works are well known through the medium of engravings. The principal are 'Covenanters' Preaching,' 'Battle of Drumclog,' 'A Highland Funeral,' 'Children blowing Bubbles in Old Greyfriars' Churchyard,' 'First Reading of the Bible in the Crypt of St Paul's,' 'Bunyan in Bedford Gaol' and 'Bunyan and his Daughter selling Laces,' 'Shakespeare before Sir T. Lucy,' 'The Curlers,' and 'Leaving the Manse.' In his later years Harvey devoted much time to landscape-painting.

Harvey, William, the discoverer of the circulation of the blood, was born at Folkestone, in Kent, on the 1st of April 1578. His father was a yeoman; and his brothers were merchants of weight and substance, *magni et copiosi*, in the city of London. After six years at Canterbury grammar-school, Harvey, then sixteen years of age, was entered at Caius College, Cambridge. He took his degree in arts in 1597, and, after five years' study at the university of Padua under Fabricius de Aquapendente, Julius Casserius, and other eminent men who then adorned that university, he obtained his diploma as doctor of medicine in 1602. He returned to England in the same year; and after receiving his doctor's degree from his original university, Cambridge, settled in London as a physician. In 1609 he was appointed physician to St Bartholomew's Hospital, and in 1615 Lumleian Lecturer at the College of Physicians—an office then held for life; and it is generally supposed that in his first course of lectures (in the spring of 1616) he expounded those original and complete views of the circulation of the blood with which his name is indelibly associated. It was not till the year 1628 that he gave his views to the world at large, in his celebrated treatise entitled *Exercitatio Anatomica de Motu Cordis et Sanguinis*, having then, as he states in the preface, for nine years or more gone on demonstrating the subject in his college lectures, illustrating it by new and additional arguments, and freeing it from the objections raised by the skilful amongst anatomists. He was appointed successively physician to James I. and Charles I.; and in 1633 we find that his absence, 'by reason of his attendance on the king's majesty,' from St Bartholomew's Hospital was complained of, and that Dr Andrews was appointed as his substitute, 'but without prejudice to him in his yearly fee or in any other respect'—a procedure which shows the esteem in which Harvey was held. We learn from Aubrey that he accompanied Thomas Howard, Earl of Arundel, in his embassy to the emperor in 1636; and during this journey he publicly demonstrated to Caspar Hofmann, the distinguished professor of Nuremberg, and one of the chief opponents of his views, the anatomical particulars which made the circulation of the blood a necessary conclusion—a demonstration which, it is reported, was satisfactory to all present save Hofmann himself, who still continued to urge futile objections. To appreciate the importance of Harvey's discovery and the nature of the objections that would be urged against it, it is sufficient to state that Harvey's first step was to prove that the arteries contained not air but blood. The whole course of the circulation could not be demonstrated, as Harvey had no idea of a system of capillaries uniting arteries and veins. These were discovered by Malpighi some fifty years later. He attended the king in his various expeditions, and was present with him at the battle of Edgehill (October 23, 1642). 'During the fight,' says Aubrey, 'the Prince and Duke of York were committed to his care. He told me that he withdrew with them under a hedge, and tooke out of his pockett a booke, and read. But he had not read very long before a bullet of a great gun grazed on the ground neare him, which made him remove his station.' He accompanied the king after the battle to Oxford, where he resided nearly four years, receiving the honorary degree of Doctor of Physic, and being elected warden of Merton College. On the surrender of Oxford to the Parliament in July 1646, he left the university and returned to London. He was now sixty-eight years of age, and seems to have withdrawn himself from practice and from all further participation in the fortunes of his royal master. During the remainder of his life he was usually the guest of one or other of his brothers, now men of wealth and high standing in the city; and it was at the country-house of one of them that Dr Ent visited him at Christmas 1650, and after 'many difficulties' obtained from him the MS. of his work on the generation of animals, which was published in the following year, under the title of *Exercitationes de Generatione Animalium*.

From this period to the time of his death the chief object which occupied his mind was the welfare and improvement of the College of Physicians. In 1654 he was elected president of the college, but he declined the office on account of his age and infirmities. In July 1656 he resigned his Lumleian lectureship, which he had held for more than forty years; and in taking leave of the college presented to it his little patrimonial estate at Burwash, in Sussex. He did not long survive, but, worn out by repeated attacks of gout, died at London on the 3d June 1657, and was buried in a vault at Hempstead, near Saffron Walden, in Essex. On 18th October 1883, at the cost of the Royal College of Physicians, his remains were removed from the dilapidated vault, and with befitting solemnity reinterred in a marble sarcophagus in the Harvey Chapel attached to the same church.

Harvey's works in Latin were published in 1766; a translation by Dr Willis in 1847 (new ed. 1884); and his *Prælectiones Academicæ* by a committee of the Royal College of Physicians in 1887. See Willis's *Life of Harvey* (1878), Huxley at the Tercentenary (*Nature*, 1878), and D'Arcy Power (1897). A statue of Harvey was erected at Folkestone in 1881.

Harwich, a municipal borough, seaport, and market-town of Essex, is situated on a promontory

at the influx of the confluent Stour and Orwell to the sea, 71 miles by rail NE. of London. Southward of Harwich is the watering-place of Dovercourt, with a sea-wall 2 miles long. The chief industries are shipbuilding, fishing, and the manufacture of cement. Steamers run daily to Ipswich, and there are regular lines of packets to Antwerp, Rotterdam, London, &c. The harbour is capacious, safe, and commodious, having been much improved since 1844. It is defended by a battery, and, on the Suffolk side, by Landguard Fort, which dates from the reign of James I. So great have been the encroachments made by the sea on the promontory on which Harwich stands that two jetties or groins, 1350 and 1000 feet long respectively, were undertaken in 1863 to break the force of the waves, and these have proved very successful. From the 14th century till 1867 Harwich returned two members, and from then till 1885 one. Pop. (1851) 4451; (1881) 7842; (1891) 8191.

Harz Mountains, a mountain-range of Germany, extending between the rivers Weser and Elbe, south of Brunswick, with a length of 57 miles, a breadth of 20, and a superficial area of 784 sq. m. It forms an elevated plateau, rising on most sides somewhat steeply from the plains, and ridged with irregular and in some parts forest-clad mountains. The range, which is divided into Upper and Lower Harz, the average elevations of which are 2100 and 1000 feet respectively, is composed for the most part of rocks belonging to the Devonian and Lower Carboniferous formations, and broken through in a few places by granite, as in the Brocken (q.v.), the highest peak (3740 feet) of central Germany. The Harz are exceedingly rich in metals and minerals, as silver, iron, lead, copper, zinc, marble, alabaster, and granite. These mountains form a natural line of division between the Low German and the High German races. Industries connected with the mines and the forests, as well as some cattle-breeding and agriculture, afford employment to the inhabitants. The rearing of singing-birds is also a source of profit. The Harz Mountains are the scenes of many of the weird legendary tales of German literature.

Hasdrubal ('he whose help is Baal'), the name of several Carthaginian generals, of whom the most famous was the son-in-law of Hamilcar Barca (q.v.). In 237 B.C. he accompanied Hamilcar into Spain, and gave that general most effective aid in the work of building up a Carthaginian dominion in the Peninsula. On the death of Hamilcar in 228 B.C. the task of administering and extending the new empire devolved on Hasdrubal, who advanced the Carthaginian frontier from the Bætis (the Guadalquivir) to the Tagus, and founded a new capital, Nova Carthago (the modern Cartagena), a city with the best harbour on the south-east coast of Spain, and situated in the vicinity of rich silver-mines. Hasdrubal proved himself an admirable administrator. He was remarkably successful in conciliating the Iberian tribes, and extended his rule mainly by peaceful means. So independent was he of the home government that the Romans made a treaty in which the Ebro was fixed on as the frontier line, not with Carthage, but with Hasdrubal. In the eighth year of his command, 221 B.C., he was assassinated by a Celtic slave.—Another Hasdrubal was the son of Hamilcar Barca, and the brother of Hannibal (q.v.). He defeated Cneius Scipio in Spain in 212 B.C., and in 208 marched through Gaul, to join his brother Hannibal in Italy. He crossed the Alps in favourable weather, but, instead of pushing southward, made a fatal delay at Placentia, and was surprised and slain on the Metaurus in 207 B.C.—A third Hasdrubal was one of Hannibal's principal officers in the Italian campaigns. He made a brilliant charge at the battle of Cannæ, which contributed greatly to decide the fate of the day.—A fourth general of the same name defended Carthage against the Romans during the siege which ended in the city's destruction in 146 B.C. He is accused of cowardice and cruelty, and of having starved the citizens while himself living in revelry.

Hase, KARL AUGUST VON, a celebrated German theologian, was born at Steinbach, in Saxony, 25th August 1800. After being expelled from Erlangen University for his connection with the political students' unions called the 'Burschenschaften,' he became in 1823 a university tutor at Tübingen, but after a new investigation was imprisoned for ten months in the fortress of Hohenasperg. He settled at Leipzig in 1829, and in the following year was called to Jena as professor of Theology. Here he remained till his retirement in 1883, when, after sixty years of teaching, he was ennobled, and appointed a privy-councillor. His chief writings are *Des alten Pfarrers Testament* (1824); *Lehrbuch der Evangelischen Dogmatik* (1826; 6th ed. 1870); *Gnosis* (3 vols. 1826–28; 2d ed. 1870); *Hutterus redivivus* (1828; 12th ed. 1883), which was an able attempt to present dogmatic theology in the form that Hutter would have chosen, had he been living in the present century, and involved him in a long controversy with Röhr, the exponent of 'vulgar-rationalism:' *Das Leben Jesu* (1829; 5th ed. 1865); *Kirchengeschichte* (1834; 11th ed. 1886); *Die beiden Erzbischofe* (1839); *Neue Propheten* (1851; 2d ed. 1860); a life of St Francis (1856); a handbook of Protestant polemical theology (1863); a life of St Catharine of Siena (1864); *Geschichte Jesu* (1876); *Des Kulturkampfes Ende* (1879); and lectures on church history (1880). He subsequently began the publication of a church history based on his university lectures (1885 *et seq.*). His autobiography down to 1830 is entitled *Ideale und Irrthumer* (1872; 2d ed. 1873). Hase was called the Nestor of modern scientific theology. He did great service in the reconciliation of the church's faith to modern thought, and was an equally resolute and effective opponent of orthodoxy on the one hand and rationalism on the other. He died 3d January 1890.

Haselrig (otherwise HESILRIGE or HAZLERIGG), SIR ARTHUR, one of the Five Members (q.v.), commanded a noted regiment of cuirassiers called the 'Lobsters' on the side of the Parliament, took an active part in the House of Commons in connection with the militia and other bills, and was governor of Newcastle. In 1660 he half acquiesced with Monk in the Restoration, but died a prisoner in the Tower, 7th January 1661.

Hashish, from which the word *assassin* is derived, is an Arabian preparation of Indian hemp, known in India as *bhang* or *siddhi*. It consists chiefly of the leaves and stalks of *Cannabis indica*. The medicinal value of the preparations of Indian hemp is treated in another article; see HEMP (INDIAN). It is the physiological action which will now be specially noticed. The drug is used in the East in various ways. Sometimes it is smoked alone or with tobacco. At other times beverages are prepared from it, or it is taken in the form of lozenges or electuaries. The *majoon* of Calcutta, the *mapouchari* of Cairo, and the *dawames* or *dawamese* of the Arabs are preparations of this kind. The effects differ according to the dose and the idiosyncrasy of the individual. Some become pugnacious, while others fall into a state of reverie. After small doses there is a great tendency to causeless merriment. In most cases there is an extraordinary susceptibility to hallucinations of various kinds, their nature depending largely on the cast

of mind of the person, and to some extent on his surroundings. Time, distance, and sound are no longer correctly judged of. A minute may have compressed into it the action of a month, a hand breadth may stretch out to a mile, and the ripple of a brook may swell into the roar of Niagara. Although the dreams produced in Orientals by the drug are often of a voluptuous nature, this is by no means a universal effect, and among Europeans they have not this character. The stage of hallucination is generally succeeded by a stage of deep slumber with diminished sensibility. The unpleasant after-effects of opium seem to be absent; but the use of hashish has the inevitable demoralising effects of all such indulgences. See Moreau, *Du Hachisch et de l'Aliénation Mentale* (1845).

Haslar Hospital, to the south of Gosport (q.v.), between Haslar Lake and the sea, is an enormous establishment for the officers and men of the navy, dating from 1746, and capable of accommodating 2000 patients. The Royal Naval Chapel is also here, and beyond are the Haslar barracks.

Haslingden, a municipal borough (since 1891) of Lancashire, 19 miles NW. of Manchester. Cotton, silk, and woollen manufactures are carried on. In the vicinity are ironworks, coal-mines, and stone and slate quarries. Pop. (1851) 6164; (1881) 16,298; (1891) 18,225.

Hasmoneans. See MACCABEES.

Hassan-ben-Sabah, the 'Old Man of the Mountain' of European story, was founder of the Moslem sect of the Assassins (q.v.).

Hasse, JOHANN ADOLF, composer, was born at Bergedorf, near Hamburg, 25th March 1699, and studied in Italy under Porpora and Scarlatti. He became famous as *Il Sassone* ('the Saxon') through his opera *Sesostrate*, produced at Naples (1725); was *kapell-meister* at Dresden; and was brought to London in 1733 to head an opposition to Handel as representing the Italian school. Here *Artaserse* was produced with success; but Hasse soon left London, and in 1740 was in Dresden, subsequently retiring to Vienna and to Venice, where he died 23d December 1783.

Hasselt, capital of the Belgian province of Limburg, situated 18 miles by rail NW. of Maastricht, has several distilleries, manufactures linen fabrics, lace, and tobacco, and cultivates tobacco, madder, and chicory. Pop. 13,194.

Hâstinapur, a ruined city of India, on the old bed of the Ganges, 22 miles E. of Meerut. It was the capital of the great Pandava kingdom, frequently mentioned in the Mahâbhârata.

Hastings, a parliamentary and municipal borough and famous watering-place of Sussex, is picturesquely situated on the shore, and surrounded by high cliffs on all sides except the south, which is open to the sea. By rail it is 33 miles E. of Brighton and 62 miles SSE. of London. It consisted formerly of only two streets, intersected by a small stream called the Bourne, but is now a large place, whose resident population is doubled during the holiday season. Since the middle of the 19th century the borough has been greatly extended, and some portion of the hills which shelter the town contain several fine streets and terraces. The breezy and nicely-paved esplanade, over 3 miles in length, forms one of the finest sea-walks and drives in the kingdom. The climate is dry and agreeable, and the bathing very good. During cold weather in winter and spring the place is a commended resort for pulmonary complaints, being sheltered by the hills inland from easterly and northerly winds. It is famous for the mildness, salubrity, and evenness of its climate, the mean daily range of shade temperature being remarkably small (9·9) as compared with nearly all other stations on the south coast. It has been said to offer a choice of three climates—the mild of the sea front, the more bracing of the inland, and the extremely bracing and invigorating of the surrounding hills, 500 feet above the sea. The sandy soil secures a dryness of soil and atmosphere not usually to be had at seaside resorts. According to Dr Parsons, 'the hottest days in summer are eight degrees cooler than London, and, contrary to general belief, three degrees cooler than Eastbourne.' The drainage is good, the *British Medical Journal* stating that 'Hastings is one of the best drained and ventilated of seaside places.' The water-supply is pure and abundant; and salt water is laid on for watering the streets, and can be supplied direct from the main to private houses for bath purposes. The corporation have purchased for a considerable sum the East and West Hills, fine open plateaus commanding beautiful land and sea views, and admirably adapted for golf and other outdoor sports.

The East Hill Cliffs present great interest to geologists, and are part of the property purchased. They descend sheer into the sea, and are remarkable for their rugged beauty as seen from the ocean. There are three large public gardens, one of them exceedingly pretty, and an extensive Alexandra Park, opened by the Prince and Princess of Wales in 1882. The amusements of the place are many and varied. Hotels are plentiful, and several large and flourishing schools have been established, the Hastings centre taking a large place in the Oxford and Cambridge local examinations. A great attraction is the pier, extending 900 feet, and having a spacious pavilion at the sea end giving accommodation for between 2000 and 3000 persons. A similar pier was, in 1890, in course of construction at St Leonards, about a mile westwards. The 'premier Cinque port' is the largest and richest fishing-station on the south coast. On 16th June 1897 Lord Dufferin laid the foundation of a new harbour of 27 acres. The ruined castle was built by a follower of the Conqueror. Hastings (since 1885) returns only one member to parliament. Pop. of parl. borough (1851) 17,011; (1881) 42,258; (1891) 52,340. See W. D. Cooper's *Notices of Hastings* (1862); and Montagu Burrows' *Cinque Ports* (1888).

THE BATTLE OF HASTINGS is the usual name given to the great battle at Senlac, near Hastings, in which the English under King Harold were completely defeated by the Norman invaders under William the Conqueror, October 14, 1066. From that fatal day until now the place has borne the name of Battle (q.v.). Harold's force was drawn chiefly from the southern counties, and was firmly posted on the Hill of Senlac, fortified with a stockade and ditch. The Normans were arranged in three divisions, the centre led by the redoubtable duke in person. The Norman foot began the battle, and it is said that the minstrel Taillefer, riding in front singing the Song of Roland, was the first to strike a blow and the first to fall. The Norman foot spent their fury in vain upon the English stockade, while the Bretons on the Norman left wing were quickly put to flight. A cry now arose that the duke was slain, and panic quickly spread throughout the army. 'I live,' shouted William, as he tore off his helmet, 'and by God's help will conquer yet,' and led on his men anew to the attack. Not, however, till by a counterfeited flight he had drawn the English in eager pursuit from their strong position was he able to break their line and obtain a footing on the high ground on which they had stood so stubbornly. With the quick eye of the true soldier, William now commanded his archers

to shoot high into the air that their arrows might fall from above. The English fell quickly, their shields being unable to protect their heads, and the king was soon struck down by an arrow in the right eye. The battle was now lost, but the housecarls fought where they stood till the last man was slain. See the third volume of Freeman's *Norman Conquest*.

Hastings, Francis Rawdon-Hastings, Marquis of, Governor-general of India, was descended from an old Anglo-Norman family settled in County Down, Ireland, and was born on 9th December 1754. Entering the army in 1771, he was engaged in many of the chief operations of the war of American independence, fighting at Bunker Hill, in Long Island and New Jersey, at the siege of Charleston, and at the battles of Camden and Hobkirk's Hill, and attained the rank of adjutant-general under Lord Cornwallis. On his return home he was created (1783) Baron Rawdon, and afterwards became intimate with the Prince of Wales. A year after he had succeeded his father as Earl of Moira he carried (1794) an army corps of 10,000 men across to Holland, to reinforce the Duke of York; and in the following year participated in the attack on Quiberon. Under the Fox-Grenville ministry he was in 1806 appointed master-general of ordnance; and he took an active part in politics until his appointment to the governor-generalship of Bengal in 1813. This high office he held down to 1821. The most momentous events of his administration were the war against the brave mountaineers of Nepal, the Goorkhas, who by the peace of 1816 were converted from aggressive enemies into the staunchest of allies; and in the next year the wars against the Pindáris and the Mahrattas, both of which were speedily brought to a successful termination, with the result that a large addition was made to the territories of the East India Company. For his masterly treatment of the Goorkha question Lord Moira was created Marquis of Hastings (1816). His policy in India included the encouragement of native education and of the freedom of the press, a reform in the law system, and the elevation of the status of the civil service. His resignation was caused by imputations levelled against his public conduct in connection with the affairs of a banking firm. In 1824, the year after his return home, Lord Hastings was appointed governor of Malta, and he held this office until his death, at Baiæ, near Naples, on 28th November 1826. See his *Private Journal*, edited by his daughter (2d ed. 1858); Prinsep's *Administration of the Marquis of Hastings* (1825); *Asiatic Journal* (1823); and Ross's monograph in the 'Rulers of India' series (1893).

Hastings, Warren, was born at Churchill, in Oxfordshire, 6th December 1732. He was descended from the family of Hastings of Daylesford, but the estate had passed out of the family, and Hastings, who was early left an orphan, was educated at the expense of an uncle. He distinguished himself at Westminster School, where he was contemporary with the poets Churchill and Cowper, with the future Lord Shelburne, and with Elijah Impey (q.v.). In 1750 he went out in the Civil Service of the East India Company, and was at first employed in the secretariat in Calcutta. He was up the country at the time of the Black Hole affair, but made his escape and joined the refugees at Falta Ghat, where he married his first wife; she died after bearing two children, who lived but a few years. Left a widower, Hastings returned to England in 1764, where he spent five years and made the acquaintance of Dr Johnson. In 1769 he returned to India as second-in-council at Madras, and in 1772 proceeded to Bengal, where he was promoted to the presidency of the council. A year later the British parliament produced the Regulating Act, under which Hastings was to be governor-general with a handsome salary, and was to be assisted by a council of four members, three appointed from home. This was the beginning of trouble; the majority in council led by Francis was opposed to Hastings from the first; the finances were in great disorder, the demands of the Company for remittances were frequent and urgent. One of Hastings' first tasks was to bring to trial the chief fiscal ministers of Bengal, Rája Shatáb Rai and Nawáb Muhamad Raza, on charges of malversation and embezzlement. This, though done under positive orders from home, proved injurious to Hastings' popularity. A corrupt and treacherous official, Nuncomar (Rája Nand Kumar), was employed in conducting the case; and when it broke down all three became his enemies. In 1775 Nuncomar was tried, sentenced, and executed for forgery, a proceeding which threw obloquy on Hastings and on the chief-justice, Sir Elijah Impey, which has been much dispelled in recent times. Among measures of domestic reform, Hastings made an appraisement of the landed estates which formed the assets of a great portion of the public revenue, and on that appraisement based a revised assessment. He also improved the administration of justice in the country courts and organised the opium revenue. In his external policy he was no less energetic and original. He waged vigorous war with the Mahrattas, and made the Company's power paramount in many parts of India. He contracted advantageous alliances and restored the financial position of the Company. All this was not done without encountering opposition and censure. In 1777 an attempt was made to depose him, on the strength of a conditional resignation which he had sent home; and the attempt was only frustrated by the action of the Supreme Court, of which Impey was still chief-justice. In the same year Hastings married the divorced wife of Baron Imhoff, a German officer. In 1780 he was finally freed from embarrassment by the opposition owing to the retirement of its leader, Philip Francis, whom he wounded in a duel.

At the end of 1784 he resigned office and sailed for England, where he was well received by King George III., but soon became subject to a parliamentary inquiry, with a view to impeachment. Into the details of the charges brought against him we cannot here enter. Among the chief misdeeds alleged against him were the aid that he gave to his ally the Nawáb of Oudh in the war against the Rohilla Afghans, his punishment of the Zemindar of Benares for non-compliance with a demand for aid in the first Mahratta war, and his connivance in the forfeiture of property—real and personal—which had been conferred on the Begums or dowager-princesses of Oudh. Charges on these subjects were preferred by the Whig opposition, and Hastings, being deserted by Mr Pitt, was impeached at the bar of the House of Lords. The trial began 13th February 1788 in Westminster Hall, among the managers for the Commons being Edmund Burke, Fox, Sheridan, Elliott (afterwards Lord Minto), and Mr (afterwards Earl) Grey. The early sittings were numerously attended, and the audience was rewarded by splendid displays of rhetoric; but the public interest soon flagged. It was felt by those persons who knew or cared about the matter at all that the alleged errors of Hastings were overbalanced by great public services. He had prevailed in war; he had left Bengal at peace; he had organised the administration in all its branches; he had fostered learning; above all, he had founded an empire which no one thought of abandoning. The trial dragged itself through more than seven years and nearly 150 sittings. At last,

on the 23d April 1795, Hastings was acquitted on all the charges, unanimously on all that affected his personal honour. Out of the original members who had met in Westminster Hall when Hastings first bowed his knee at the bar but twenty-nine were left to vote for the final award; the remaining peers stood round the throne as spectators. Hastings left the court a ruined man, the small fortune that he brought from India having been quite consumed in the expenses of the defence. But the Court of Directors came to his aid and made provision for his declining years. Carrying out what is said to have been an aspiration of his youth, Hastings bought the old family seat of Daylesford, in Worcestershire, where he passed the rest of his life in the occupations of a country gentleman, varied by occasional visits to London. He gave evidence before parliamentary committees, and dined at Carlton House; the prince-regent made him a privy-councillor; and he received honours from the city and the Houses of Parliament. He died at Daylesford, 22d August 1818, his wife surviving him. In his long and active career Hastings showed constant energy, courage, judgment, and application. In his private life he was gentle and unselfish. He left no children.

See Gleig's *Memoirs* (3 vols. 1841); Mill's *History of India*, corrected by Wilson's notes; Stephen's *Story of Nuncomar*; Trotter's *Biography* (1878); the article by the present writer in the *Dictionary of National Biography*; Lyall's *Warren Hastings* (1889); Strachey's *Hastings and the Rohilla War* (1892); Forrest's *Administration of Warren Hastings* (1892); Col. Malleson's *Life of Warren Hastings* (1894); and Sir C. Lawson's *Private Life of Warren Hastings* (1896); Macaulay's eloquent essay is untrustworthy.

Hastings Sands, the lower division of the Wealden beds, part of the Lower Cretaceous series. The beds consist chiefly of sand and sandstone with subordinate layers of clay, and vary in thickness from 500 to 1000 feet; and the group embraces, in descending order: (3) Tunbridge Wells Sand, (2) Wadhurst Clay, (1) Ashdown Sand. The strata differ very little from those of the overlying Weald Clay, except in being more arenaceous. The beds have been deposited in shallow fresh water. The sand often exhibits fine specimens of ripple-marks, and the clay which separates the sand-beds sometimes contains cracks that have been produced by the drying of the surface on exposure. The strata are highly fossiliferous. There are numerous saurian reptiles, including the huge iguanodon and the flying pterodactyle. The remains of several chelonians also occur. The fish belong chiefly to the ganoid or placoid orders, the most remarkable being the lepidotus, whose conical palate teeth and thick square enamelled scales are very frequent. The shells belong to genera which inhabit fresh water, such as Paludina, Cyclas, and Unio.

Hat, the principal head-covering of the human family, distinguished from the cap or bonnet by having a brim around it. The history of the hat is of necessity intimately mixed up with that of head-coverings generally, the distinctions of bonnets, hats, and caps being arbitrary and subject to many variations with changing fashion (see illustrations in article Fashion). The hat, as a roomy brimmed head-covering, is the direct descendant of the *petasus* of the ancient Greeks, which was distinguished from the other Greek head-gear, the *pileus*, by the possession of a brim, useful for protecting its wearer from the rays of the sun. These Greek hats were made of felt, the material of which the head-gear of early times appears to have been principally fabricated. The use of felted hats became known in England about the period of the Norman conquest. The merchant in Chaucer's Prologue to the *Canterbury Tales* is described as having 'on his hed a flaundrish bever hat.' About the period of Queen Elizabeth beaver felts in many shapes became common, and for three centuries thereafter fine beaver hats, mostly dyed black, formed the head-covering of the higher classes in Great Britain. But now, though felt hats are the everyday wear of the community, there is no longer such a thing as a genuine beaver hat. See Beaver, Felt.

Hats at the present day are fashioned of an endless variety of materials, and, especially in the case of those worn by ladies, they are so diversified in form that they defy all definition. But with all their variations three principal classes of hat-manufacture may be distinguished, comprised under the felt-hat, the silk-hat, and the straw-hat trades. In the felt-hat trade, the materials now principally employed are the fur or hair of rabbits, with smaller proportions of hare, beaver, musk-rat, vicuna, and camel for the finer felts; and sheep's wool for the commoner felted hats. Felt hats of inferior quality are also made with wool mixed with cotton and other vegetable fibres—not in reality felted, but cemented by varnish which is used at once to hold together the fibres and to stiffen the hat body. In the felting of rabbit, hare, and other furs, a 'bat' is first formed, which consists of an expanded cone of equally distributed fibres in quantity sufficient to form the desired hat. To make this 'bat,' a perforated cone of sheet copper is caused to revolve slowly over a funnel under which there is a powerful blast drawing air inwards through the holes in the copper cone. Fur is fed towards and drawn over the surface of the cone in an equal manner by the suction, and is so held in position till a sufficient quantity to form the hat is uniformly distributed over it. A wet cloth is then wrapped around the mass, over which an outer cone is slipped, and the whole then dipped into an acidulated bath of hot water, and by pressure the first stage of felting—making the bat cohere—is secured. The subsequent operations are the same in making both fur and woollen felts. In the felting of wool for hats the bat is formed from carded wool wound diagonally round a double cone, which gives two bats. These are subjected to the usual operations of felting till a sufficient consistency of felt is obtained. The hats are thereafter roughly blocked on a mould to something of their ultimate form, then dyed, and when hard felts are to be made they are stiffened with a varnish of shellac. They are then shaped on a block, smoothed with sand-paper, bound, lined, and finished. The principal supply of rabbit fur for felting is obtained in France and Belgium from domestic rabbits, hundreds of millions being in these countries annually killed as articles of food and for the fur they yield.

The manufacture of silk hats as a substitute for piled beavers was first attempted about 1810, but it was not till 1830 that silk plush hats were successfully made in France. The silk hat consists of a body and rim, usually made of two or three layers of cotton cloth saturated with varnishes, to give the fabric stiffness and make it waterproof. These are moulded on wooden blocks according to the fashion of the day; and when the desired shape is produced the whole is carefully varnished over with lac and dammar varnish, and before dry the fine silk plush is applied with great nicety, so as to prevent the seams being perceived. It is then trimmed with silk braid on the edge of the brim, and a silken band round the junction of the body with the brim; and the lining of leather and thin silk being put in, it is complete. Opera-hats or crush-hats consist of a covering of merino stretched over a spiral steel frame, which by pressure flattens down, so that they can be easily carried.

The manufacture of straw hats, which forms an

entirely distinct branch of the hat trade, will be dealt with under Straw-plait (q.v.). In the United Kingdom the felt-hat trade is principally centred at Denton and other villages in the neighbourhood of Manchester. In the year 1888 there were exported from the United Kingdom 1,331,627 dozen hats of all kinds, valued at £1,252,017.

Hatch, EDWIN, a learned theologian, born at Derby, 4th September 1835. He was educated at King Edward's School, Birmingham, and at Pembroke College, Oxford, and took a second-class in classics in 1857. After some years of teaching as professor of Classics at Trinity College, Toronto, and rector of Quebec High School, he returned to Oxford as vice-principal of St Mary Hall in 1867, a post which he held till his resignation in 1885. He was appointed rector of Purleigh, Essex, in 1883, and next year reader in Ecclesiastical History at Oxford. The Grinfield lectureship on the Septuagint he held from 1880 to 1884. His articles on such heads as 'Ordination,' 'Priest,' &c., in Smith and Cheetham's *Dictionary of Christian Antiquities*, had already attracted wide attention, when his profoundly learned and admirably argued Bampton Lectures, in 1880, on *The Organisation of the Early Christian Churches*, firmly established his reputation both in England and Germany as one of the ablest and best-equipped theologians of the time. The book struck a blow at the roots of High Church claims, and proved to be more easily denounced than answered. It had the honour to be translated by Harnack. In 1888 he delivered a course of Hibbert Lectures on *Greek Influence on Christianity*. Hatch was made D.D. by Edinburgh in 1883; published in 1887 *The Growth of Church Institutions*, a profoundly learned book, though written in a bright and popular style; *Essays in Biblical Greek* in 1889; and had made considerable progress with his projected *Concordance to the Septuagint* when his career was cut short by untimely death, at Oxford, 10th November 1889. A collection of noble religious poetry, *Towards Fields of Light* (1889), and a volume of striking sermons, *The God of Hope* (1890), appeared posthumously, the latter with a brief biographical sketch by his brother. See Dr Sanday in the *Expositor* for February 1890.

Hatching. See INCUBATION, POULTRY.

Hatchment. ACHIEVEMENT, or FUNERAL ESCUTCHEON, the arms of a deceased person within a black lozenge-shaped frame meant to be placed on the front of his house. If the deceased was unmarried or a widower or widow the whole field of the escutcheon is black. In the hatchment of a married person only that part is black which adjoins the side of it occupied by the arms of the deceased. Thus, in the hatchment of a husband the dexter side is black, the sinister white; in that of a wife the reverse. The old funeral escutcheon of Scotland, similarly to that of Germany, had the *seize quartiers* of the deceased arranged round his personal arms, and in strictness no one, unless his ancestors on every side up to four generations had armorial rights, was entitled to a funeral escutcheon. Escutcheons of this kind are now seldom seen even in Scotland. The black frame is sometimes powdered with drops to represent tears, and the skull and cross-bones at the corners are hardly out of use.

Hatchment of Husband.

Hatfield, or BISHOPS HATFIELD, a market-town of Hertfordshire, 18 miles NNW. of London by rail. There exist a few scanty remains of the 12th-century palace, once the property of the bishops of Ely, but, together with the manor, seized by Henry VIII., and successively the residence of that king, of Edward VI. and Queen Elizabeth before their accession, and of James I. Hatfield House, the seat of the Marquis of Salisbury, was built by Sir Robert Cecil in 1611, and is a fine specimen of Jacobean architecture, rich in portraits and historical manuscripts. Pop. of parish (1851) 3862; (1891) 4330. See a fine account of its history in Brewer's *English Studies* (1881).

Hatfield Chase, a fenny tract of land in the West Riding of Yorkshire, lying between the Trent and Doncaster, some 180,000 acres in extent, which has been drained, and is now cultivated. See *The Level of Hatfield Chace*, by John Tomlinson (1882).

Hatherley, SIR WILLIAM PAGE WOOD, BARON, Lord Chancellor of Great Britain, was born in London in 1801, and educated at Winchester, and Trinity College, Cambridge, and subsequently called to the bar. He was returned in 1847 as Liberal member for Oxford, in 1851 was appointed solicitor-general and knighted, in 1853 became vice-chancellor, in 1868 a lord justice in the Appeal Court and lord chancellor, being at the same time raised to the peerage as Baron Hatherley. His name is associated with a Bankruptcy Act of 1869. He resigned office in 1872 in consequence of failing eyesight, and died on 10th July 1881. From his pen came *Truth and its Counterfeits* (1857) and *The Continuity of Scripture* (1867–69). See *Memoir* by W. R. W. Stephens (1882).

Hathor, the name of an Egyptian goddess, ranked among the second class of deities, who was the daughter of Ra, the sun. See EGYPT.

Hathras, a well-built town of India, in the North-west Provinces, 21 miles S. of Aligarh. It is the commercial centre for the Upper Doab, and has a large export trade in sugar, grain, cotton, oil-seeds, and *ghi*, and imports iron and metal-wares, cloth, &c. The delicate carved work of the town is famous. Pop. (1891) 39,181.

Hátim et-Ta'í was chief of the Arabian tribe of Taï, and flourished shortly before the advent of Mohammed. He was renowned for his extraordinary liberality, and his name is at the present day synonymous throughout the Moslem world with all that is open-handed and generous. No greater compliment, indeed, can be paid to an Asiatic prince or noble than to style him 'a second Hátim.' Many anecdotes of his liberality and magnanimity are recounted by poets; thus Sa'di says: 'Hatim Taï no longer exists, but his exalted name will remain famous for virtue to eternity. Distribute a tithe of your wealth in alms, for when the husbandman lops off the exuberant branches from the vine it produces an increase of grapes.' See Clouston's *Group of Eastern Romances* (1889).

Hatteras, CAPE, a low point of North Carolina, forming part of a sandbank, in 35° 15′ N. lat. and 75° 31′ W. long. The coast-line here turns from the direction of north-east to that of due north; violent storms are frequent and render navigation dangerous, and the island is marked by a light raised 190 feet above the sea.

Hatti Sherif. See FIRMAN.

Hatto, the name of two archbishops of Mainz, who have a somewhat conspicuous place in the history of Germany. The first of these was chosen Archbishop of Mainz in 891, and died in 913.—The

second archbishop of that name was a monk of the monastery of Fulda, and succeeded the celebrated Rabanus Maurus, well known in the history of the eucharistic controversies, as abbot of the monastery of St Boniface, about the year 942. In the second expedition of the Emperor Otho I. into Italy in 961 Hatto was sent as his ambassador from Pavia to Rome; and after his return, on the death of Archbishop William, he was raised to the see of Mainz, and continued one of the chief directors of the imperial counsels. Of his after-life and of his personal character the most opposite accounts have been given. By some he is represented as a zealous reformer, and an upright and successful administrator; by others as a selfish and hard-hearted oppressor of the poor; and the strange legend of his being devoured by rats, which Southey has perpetuated in his well-known ballad, is represented as an evidence of the estimate that was popularly formed regarding him. It is by no means improbable, however, that this legend is of a much later date, and that its real origin is to be traced to the equivocal designation of the tower on the Rhine, Maüsethurm, near Bingen, which has been selected as the scene of the occurrence. *Mausethurm*, 'Mouse-tower,' is possibly only a corrupted form of *Mauth-thurm*, 'Toll-tower,' a sufficiently descriptive name; but the modified form of the word might readily suggest a legend of mice or rats. Another etymology is from *musaria*, an old word for ordnance. The date at which the Mausethurm was built is unknown, and it is far from certain that it is not much later than the time of Hatto. It was stormed by the Swedes in 1635. Archbishop Hatto died in 969 or 970. See Baring-Gould, *Curious Myths of the Middle Ages* (1869), and Max Beheim, *Die Mausethurm sage* (1888).

Hatton, JOHN LIPTROT, a self-educated musical composer, was born at Liverpool in 1809, and, settling in London in 1832, soon made his name known as a composer. From 1853 to 1859 he was musical director of the Princess's Theatre. He composed numerous operas, cantatas, overtures, entr'actes, &c., but is remembered chiefly for his musical settings of English songs, such as 'Goodbye, Sweetheart,' 'The Tar's Song,' 'When Evening's Twilight,' 'The Bait,' 'To Anthea,' &c. He died at Margate on 20th September 1886.

Hatzfeld (Hung. *Zsombolya*), a town of Hungary, 20 miles by rail W. of Temesvar. Pop. 8621.

Hauberk. See ARMOUR.

Hauch, HANS CARSTEN, Danish poet, was born at Frederikshald, in Norway, 12th May 1790. His first attempts in literature being unsuccessful, he began to study natural history; but in 1846 was appointed to the chair of Northern Literature in the university of Kiel. Two years later the Holstein revolution drove him back to Copenhagen; and on the death of his friend Oehlenschläger, in 1850, he succeeded him in the chair of Æsthetics at the university there, and held it down to his death, at Rome, 4th March 1872. Hauch's riper and more successful works embrace nine historical tragedies, all written between 1828 and 1850, in which he exhibits great powers of individualising character and portraying the local colouring of his scenes; *Lyriske Digte* (1842, 1862, and 1869), some of which are extremely beautiful, and enjoy an undisputed popularity in Denmark; and many tales and romances, &c. His epic-dramatic poem *Hamadryaden* (1830) met with warm appreciation in Germany. At Copenhagen there appeared in 1873–75 Hauch's *Samlede Romaner og Fortallinger*.

Hauff, WILHELM, German writer, was born at Stuttgart, 29th November 1802, and was educated at Tübingen. He acted for a couple of years as private tutor, and had been editor of the *Morgenblatt* for about three-quarters of a year when he died, 18th November 1827. Although only twenty-five at the time of his death, Hauff has left behind him works which have taken a permanent place in German literature; he has even become well known of late years, through several translations and editions of his best books, in Great Britain. This reputation is due to his *Marchen* or fairy-tales (1826–28) and his *Tales* (1828), all alike admirable for their freshness, simplicity, and playful fancy. Two of the latter, *Die Bettlerin vom Pont des Arts* and *Das Bild des Kaisers*, may be regarded as his masterpieces. The greatest effort of his playful fancy was, however, the exhilarating *Phantasien im Bremer Rathskeller* (1827). Some of his poems, of which he only wrote a few, have become *volkslieder*. All these works were but short; his longest productions were none of them so successful. The romance of *Lichtenstein* (1826), although popular in Germany, owing to its local fidelity and its being almost the first historical novel written in German in Sir Walter Scott's style, reveals several defects when tested as a work of art. His earliest lengthy work, *Memoiren des Satans* (1826–27), is an incomplete and immature production, but full of promise as an example of satiric humour. In the same vein Hauff wrote a parody of Clauren in *Der Mann im Mond* (1826), and an earnest satire against him in *Kontroverspredigt* (1826). His *Sammtliche Werke* were published by G. Schwab in 5 vols. in 1830 (18th ed. 1882).

Haug, MARTIN, Sanskritist, born 30th January 1826, near Balingen, in Wurtemberg, was professor at Pooma from 1859 to 1866, and at Munich from 1868 till his death, 3d June 1876. He wrote on the Pehlevi language, and on the Rig-veda, and *Essays on the Sacred Language, Writings, and Religion of the Parsees* (1862).

Hauksbee. See HAWKSBEE.

Haulbowline. See CORK.

Haunted Houses in former times were very common in every corner of England and Scotland, and many persistent traditions descended of unquiet spirits who were doomed to haunt for ever the spot on which they had wrought or suffered some deed of blood. Dim shadows of earthly forms, they continued into their ghostly existence the form and aspect that they wore in life, and the gaping and bleeding wounds of murder froze the heart of the beholder from age to age. Shrieks, wailings, wringing of the hands, knockings, infernal curses and blasphemies—such were some of the accessory horrors that the popular imagination cast around these ghostly creations, of whom many continued to possess, but in intensified form, all the power and disposition to evil which had belonged to them in life. These unquiet spirits could sometimes be *laid*, or compelled to rest finally in their graves, or the Red Sea, by the exercitations of clergymen of pre-eminent piety, who often contrived to exorcise them by passing a night of severe religious exercises alone in the haunted chamber or house. The inevitable decline of belief in the supernatural has swept away almost all our domestic ghosts, spite of the especial proneness of the popular imagination to this kind of belief. Of the haunted houses of Scotland, past or present, none are more famous than Glamis Castle, Cortachy Castle, and Spedlins Tower; no local ghosts were more persistent than those that haunted Newton Castle, Huntingtower, Allanbank, Woodhouselee, and Finhaven. In England, among the most striking cases are Corby Castle with its 'radiant boy,' Peel Castle with its 'Manthe Dog,' Ashley Hall, Skipsea Castle, Hilton Castle with its 'Cauld Lad,' Holland House, Rainham Hall with its 'Gray Lady,' Tharston Hall, Newstead Abbey, Powis Castle,

and Caistor Castle, round the courtyard of which drives every year a ghostly carriage drawn by four headless horses. No less rich in stories of haunted houses are Ireland, Wales, Brittany, and Germany, and no stories of this class are more weird and gruesome than the examples in the folklore of Russia. Spectral animals as well as men and strange lights were seen at some places, and there are authentic stories of undignified apparitions of whose presence mortals were made aware by their sense of smell. The 'Shuck Dog' of Norfolk is of large size and black colour, with great yellow eyes, and brings sure death to any one he meets. Sometimes, however, he is headless, or with but one blazing eye in the centre of his forehead. Indeed, the whole subject of spectral apparitions opens up a large chapter in popular demonology, which has been somewhat grotesquely overlaid with the theological conception of the devil.

Countless stories, old and new, are told of spirits that have at various times infested houses to the terror of their earthly inmates. Of these classical examples are those connected with Tedworth, testified to by Joseph Glanvill, and with Epworth Rectory, on the still less impeachable evidence of John Wesley. An interesting modern example of how stories of this kind can be manufactured even in our day, out of hearsay and third-hand statements, is that of the haunted house in Berkeley Square, which seems to have received its popularity and fame from being identified through some accidental circumstances as the scene of a similar story related in *Temple Bar* for 1868 by Rhoda Broughton of a house in the country. Those who are sufficiently interested can follow the growth, if not the actual genesis, of the story in a series of communications to *Notes and Queries*, sixth series, vols. ii. and iii.

See the article APPARITIONS and the books enumerated there; and particularly John H. Ingram's *Haunted Homes of Great Britain* (1884), and the *Proceedings* of the Society for Psychical Research, instituted in 1882.

Haupt, MORITZ, a Germanist and classical scholar, was born at Zittau, 27th July 1808, was professor at Leipzig from 1843 to 1850, and from 1853 in Berlin. He was secretary to the academy there, and died 5th February 1874. He edited several Latin classics (Ovid, Horace, &c.), and many Middle High German poems.

Haupur, a town of India, in the North-west Provinces, 18 miles S. of Meerut. Pop. 13,000.

Hauraki, a gulf and a gold-bearing peninsula of New Zealand, opposite Auckland (q.v.).

Haurân (anc. *Auranitis*), a large district in Syria, east of the Sea of Galilee. The name is sometimes restricted to one fertile plain there. See BASHAN; and works by Schumacher (1886), Conder, Palmer, Stubel, and Heber-Percy (1895).

Hauréau, JEAN BARTHÉLEMY (1812–96), historian, was born in Paris, and held posts in the National Library and the National Printing Office. He wrote on Poland, Francis I., Charlemagne, St Victor, &c., but is best known by his great *Histoire de la Philosophie Scolastique* (1872–81).

Hauser, KASPAR, a German youth, whose history, enshrouded in many elements of mystery, excited the attention of all Europe and especially of Germany. On the afternoon of 26th May 1828 a citizen of Nuremberg observed a youth, apparently about sixteen or seventeen years of age, dressed as a peasant, leaning against a wall in the market-place, and evidently in distress. But he was unable to give any account of himself; he could only utter, parrot-like, a few incoherent words, to the effect that he wanted to be a cavalry soldier. In his hand he bore a letter addressed to an officer in the town. The letter purported to be written by an illiterate workman, who said that the boy had been deposited at his door an infant by some one unknown, and that he had brought him up, but in strict seclusion. Enclosed in the letter was another, pretending to have been penned by the mother of the youth, but written by the same hand and at the same time, stating that she, a poor girl, had given birth to a babe on 30th April 1812, that his name was Kaspar, and that his father, then dead, had been a soldier. The youth's mind was totally blank, not from idiotcy, but because he had had no education whatever, and he was utterly ignorant of the commonest experiences of everyday life. His behaviour was that of a little child. He loathed all food except bread and water. The sounds, sights, and odours of the common world about him all caused him great pain. His senses were altogether unused to them, or rather they were such only as would be found in one who had lived without using them, or had lived as he had done in a state of complete darkness and complete solitude.

Some time afterwards, when his senses and his mind began to be schooled, he was able to give the following account of his former existence. As long as he could remember he had been in a hole or cage, too small for him to rest in any other posture than seated on the ground with his legs stretched straight out before him. His only clothing had been a pair of trousers and a shirt. He had never seen the sun nor heard sound of the outer world. Food—bread and water—was always supplied to him whilst he slept, and sometimes he was made to sleep by 'nasty stuff' (laudanum) put in the water. He had spent his time playing with two toy horses. He was attended to by 'a man,' who at last taught him to write a little, and to stand and to walk; and finally 'the man' had put shoes on his feet and had brought him to Nuremberg by night, and, placing the letter in his hand, had disappeared. The town authorities eventually decided to adopt this strange and forlorn being thus mysteriously brought to them. But about fifteen months later, on 17th October 1829, he was found bleeding from a wound in the forehead, which, he said, had been inflicted by 'the man.' But this individual could not be found, nor even any trace of him. Meanwhile attempts were being made to educate the untutored youth, and to civilise him. At first he showed a keen thirst for knowledge, marvellous powers of memory, and wonderful quickness in apprehension; but as his body began to grow rapidly, his mind, which had apparently been early checked in its growth, soon reached the full measure of its expansion and development. Crowds of the curious had at first flocked to see the strange boy, and visitors to the city still came to visit him. Amongst these was the eccentric Lord Stanhope, who conceived a sudden fancy for Kaspar and adopted him, sending him to Ansbach to be educated. But, as his mental development had suffered an arrest, so now his moral character began to deteriorate; and he was being gradually forgotten, when on 14th December 1833 he suddenly burst into the house, bleeding from a wound in his side, which he said had been dealt him by 'the man,' who on this occasion too could not be discovered. Three days later Kaspar Hauser died. Beyond these facts nothing more is known about him. Owing to the many inconsistencies in his story and the mystery surrounding him, many have regarded him as an artful impostor, and believe that he died an involuntary suicide. Others, again, looked upon him as the victim of a hideous crime, and believed that he was of noble birth, some indeed (since 1834) making him out to have been heir to the throne of Baden. But in 1875 the government of Baden

disproved the imputation by documentary evidence. See Eliz. G. Evans's monograph (1892).

Haussa, or Houssa, a people of the Soudan, who have been conquered by the Fulbe, and now constitute the larger part of the population in Sokoto, Adamawa, and Gando (q.v.). Whether they are of pure Negro race, or an immigrant wave of ancient Hamitic stock, now indistinguishable from the Negroes, is not yet fully determined. Their language is allied in its grammatical forms with the Hamitic tongues to the east and north, whilst its vocabulary resembles in many points that of the neighbouring Negro tribes. At any rate the Haussa language is the common medium of communication in the commercial world of central Soudan, and is spoken by 15,000,000 between the Mediterranean and the Gulf of Guinea. An association for the study of Haussa in England was founded in 1895. The Haussa themselves are keen traders, occupy themselves with agriculture and industrial pursuits, and are great slave-traders. They have adopted Islam from their conquerors. Many of them are employed as armed constabulary in the Gold Coast colonies. See Robinson's *Hausaland* (1896); Africa, Fulahs, Bornu, Kano.

Haussmann, George Eugene, who as prefect of the Seine did so much for the improvement and embellishment of Paris between 1853 and 1870, was born in that city on 27th March 1809. Entering the public service under Louis-Philippe, he distinguished himself in various parts of France, and under Napoleon III. rose to be prefect of the Seine (1853). Then it was that he began his task of improving the outward appearance of Paris by widening streets, laying out boulevards and parks, building sewers, barracks, bridges, and similar public works. For these great services he was made baron and senator. But the heavy financial burdens (£35,000,000) which these improvements laid upon the citizens was the cause of Haussmann's dismissal from office in 1870. In the following year he was, however, appointed director of the *Crédit Mobilier*, and in 1881 was elected a member of the Chamber of Deputies. 'Haussmannizing' has become a term for the reckless destruction of ancient buildings to make way for new streets. See his *Mémoires* by Havard (4 vols. 1890 *et seq.*). He died 11th January 1891.

Haut Rhin. See Belfort, Rhine.

Haüy, Rene Just, a French mineralogist, was born at St Just, department Oise, 28th February 1743, studied for the church, and took priest's orders. His attention was first turned to botany, and it was not until middle life that he commenced the study of mineralogy. He is the discoverer of the geometrical law of crystallisation, and he also considerably enriched our knowledge of pyro-electricity. After occupying several important posts, such as commissioner of weights and measures, curator of the cabinet of mines, and professor of mineralogy, he died on 3d June 1822. His most important works, besides an essay on crystals and a treatise on electricity, are *Traité de Minéralogie* (2 vols. 1801), *Traité Élémentaire de Physique* (2 vols. 1803), *Traité des Caractères Physiques des Pierres Précieuses* (1817), and *Traité de Cristallographie* (2 vols. 1822).—His brother Valentin Haüy (1745–1822) devoted his life to the education of the Blind (q.v.). He wrote *Essai sur l'Éducation des Aveugles* (1786).

Hauyne, a rock-forming mineral, having approximately the same composition as *Nosean*. The two are probably only varieties of one and the same mineral. They are anhydrous silicates of alumina and soda, or alumina and lime, with sodium and calcium sulphate. They crystallise in isometric forms, and have a hardness = 5–5·5, and a specific gravity = 2·2–2·5. Hauyne is usually bright blue to bluish-green, while Nosean is generally gray, but sometimes greenish or even dark brown. They are essentially of volcanic origin, occurring as constituents of many recent lavas.

Havana, or Havannah (properly 'San Christobal de la Habana'), the capital of the island of Cuba, and the principal centre of commerce in the West Indies, is situated on the north side of the island. Access is obtained to its magnificent well-sheltered harbour by a channel 350 yards wide, the entrance to which is defended by several forts. The streets of the older part of the town, which until 1863 was enclosed within walls, are narrow and dirty, and the harbour has been for generations polluted by the town sewage. With this older part the more modern portion lying to the west is connected by broad tree-shaded avenues and gardens. The houses, which are low, are solidly built of stone, have flat roofs, verandas, and barred windows reaching down to the ground, and are gay with paint and white marble decorations. The most noteworthy of the public buildings are the cathedral, built in the old Spanish style in 1724, whence the bones of Columbus (q.v.) were removed to Spain after the loss of the island in the war with the United States in 1898, and the hospital 'Beneficencia,' with orphan and lunatic asylums and a poorhouse. The public institutions include an arsenal, a botanical garden, a university, a technical school, and theatres. It is the seat of the governor of the island and of a bishop. Yellow fever is prevalent during the summer months. The population in 1897 was over 200,000. The staple industry of the place is cigar-making; sugar and tobacco are the staple products; molasses, rum, wax, and honey are also exported. Before the ruinous war of 1895–98 the exports had an annual value of £12,000,000, the imports of £10,000,000. The chief imports are rice, lard, flour, jerked beef, cod-fish, and coal. The United States take 90 per cent. of the exports, bring 20 per cent. of the imports, and provide vessels for one-third of the carrying trade. Another third of the vessels that enter Havana fly the Spanish flag, and the remaining third is divided between Holland, Great Britain, and France. Havana was originally founded on the south coast, near the modern Baracôa, by Diego Velasquez in 1515, but four years later was transferred to its present site. In the course of its unfortunate history it was burned to the ground by buccaneers in 1528, plundered by another band in 1555, and captured by a third in 1563, and again by the English in 1762. In the 17th century, however, it was made the chief emporium of Spanish trade in the West Indies and the point of rendezvous for the Spanish gold fleets.

Havant, a market-town of Hampshire, 8 miles NE. of Portsmouth. Tanning and matting are the chief industries. Pop. of parish, 3032.

Havas Agency, an organisation in Paris, founded by a rich merchant, Charles Havas, in the reign of Louis-Philippe, for the purpose of gathering telegraphic news and supplying it to newspapers. It was in 1879 converted into a company.

Havel, a tributary of the Elbe, which has its origin in a small lake in Mecklenburg, flows southward past Spandau to Potsdam, and thence west to Brandenburg, and finally north-west to its junction with the Elbe, opposite the town of Werben. It passes through several lakes and canals on its way. Its entire length is 220 miles; it is navigable to within 15 miles of its source; its drainage basin measures 10,160 sq. m. Its most

notable tributary is the Spree, on which Berlin stands.

Havelock, Sir Henry, one of the heroes of the Indian mutiny, was born April 5, 1795, at Bishop-Wearmouth, in Durham, where his father was a merchant and shipbuilder. He was educated at the Charterhouse, and was at first intended for the law, but, following his elder brother's example, entered the army a month after Waterloo, and went out to India in 1823. It was during the voyage that that conversion occurred which coloured all his after-life. Havelock distinguished himself in the Afghan and Sikh wars, but was still a lieutenant after 23 years' service. In 1856 he commanded a division of the army that invaded Persia. News of the Indian mutiny hastened his return to Calcutta, and ere long he had organised a small movable column at Allahabad with which to push on to the relief of the British at Cawnpore and Lucknow. A forced march brought his 2000 men to Fatehpur, where he engaged and broke the rebels. He continued his march upon Cawnpore, driving the enemy before him. The cowardly miscreants at the suggestion of the infamous Nana Sahib revenged their defeats before abandoning Cawnpore by the atrocious massacre of all the European women and children in their hands. At Ahirwa Havelock found the rebels strongly entrenched, but turned their left, and carried the village by a splendid charge of the 78th Highlanders. He now entered Cawnpore, and saw with his own eyes the horrors of the massacre. The sight steeled the hearts of his handful of heroes, who quitted Cawnpore to advance upon Lucknow. Crossing the Ganges, he repulsed the rebels at Unao, but after fighting eight victorious battles he found his little army so thinned by fatigue and sickness that he was reluctantly compelled to retire upon Cawnpore. Early in September General Outram arrived with reinforcements, and Havelock again advanced to the relief of Lucknow; Outram, with a chivalrous generosity characteristic of that heroic time, waiving his superior rank, and serving under Havelock as a volunteer until Lucknow was saved. The relieving force, which mustered 2500 men and 17 guns, after a sharp brush with the enemy engaged them at the Alum-Bagh, an isolated building about three miles from the Residency of Lucknow. Next with desperate bravery they fought their way through streets of houses, each a separate fortress, until they gained the Residency, to the indescribable joy of the beleaguered garrison. The victorious army were now in turn besieged, but held their own until November, when Sir Colin Campbell in his turn forced his way to their rescue. After the relief of Lucknow Havelock was attacked by dysentery, died November 22, 1857, and was buried in the Alum-Bagh. Before his death news arrived of his elevation to the distinction of K.C.B. Other honours were in store for him, but they came too late. He was made major-general; appointed to the colonelcy of the 3d Foot, and a baronet, with a proposed pension of £1000 a year. The rank and the pension were given to his widow, daughter of the Baptist missionary, Dr Marshman; a new patent of baronetcy issued in favour of the eldest son, as his father's was sealed only the day after his death; and a statue was erected by public subscription in Trafalgar Square. Havelock was strict in his religion, and severe in his discipline, somewhat after the type of the grave and fearless Puritans who fought and conquered under Cromwell. 'For more than forty years,' he said to Sir James Outram in his last moments, 'I have so ruled my life that when death came I might face it without fear.' This he did, and among her noblest soldiers England will never cease to remember the Christian hero, Sir Henry Havelock. See lives of him by W. Brock (1858), Miss Marshman (1860), and A. Forbes (1890).

Havelok the Dane. See the article on English Literature, Vol. IV. p. 367, and the edition of the romance by Professor Skeat (Early English Text Society, Extra Series, 1868).

Haven. See Harbour.

Haver, a term used in Scotch law to denote the person in whose custody a document is.

Haverfordwest (Welsh *Hwlffordd*), a parliamentary and municipal borough, seaport, and market-town of Wales, capital of the county of Pembroke, and a county of itself, occupies a picturesque situation on the river Cleddau, 10 miles NNE. of Milford by rail and 162 W. of Gloucester. A body of Flemings was settled in the district by Henry I. in 1107. The castle, the keep of which is now used as the county gaol, was erected by Gilbert de Clare, first Earl of Pembroke, in the 14th century. There are also remains of a 12th-century Augustinian priory. Paper-making is the chief industry. Since 1885 Haverfordwest has been included in the Pembroke boroughs, which return one member to the House of Commons. Pop. (1861) 7019; (1881) 6398; (1891) 6179.

Havergal, Frances Ridley, a popular hymn-writer, youngest child of Rev. W. H. Havergal, musical composer, and hon. canon of Worcester cathedral, was born 14th December 1836 at Astley, Worcestershire. A talented child, she familiarised herself with modern languages, tried Greek and Hebrew, and, developing her poetical gift, she gave utterance from time to time to many sweet and delicate religious strains of song. Her writings in poetry and prose have been popular with the religious public. Some of her hymns have found their way into church collections. She issued many such volumes as *Ministry of Song*, *Under the Surface*, &c. She died at Caswell Bay, Swansea, 3d June 1879. Her collected *Poetical Works* appeared in 1884, and her *Letters*, &c. in 1885. See *Memorials of Frances Ridley Havergal* (1880).

Haverhill, an ancient market-town in the south-west corner of Suffolk, 18 miles SE. of Cambridge. Pop. of parish, 3685.

Haverhill, a city of Massachusetts, at the head of navigation on the Merrimac River, 33 miles N. of Boston by rail. Its chief industry is the manufacture of boots and shoes, which employs about 6000 men in 200 factories; and there are manufactures also of iron, hats, glass, &c. Pop. (1870) 13,092; (1890) 27,412.

Havers, Clopton (1655–1702), anatomist and physician, after studying at Cambridge and Utrecht, where he graduated, settled in London in 1687. His *Osteologia Nova, or Some New Observations of the Bones and the Parts belonging to them* (Lond. 1691), was long a standard work; and his name is perpetuated as the discoverer of the Haversian canals in Bone (q.v.). Other details of his life are not known.

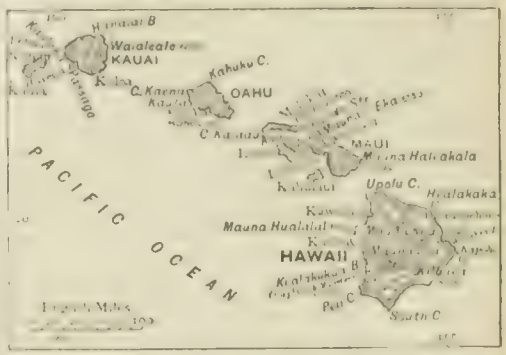
Havildar, the highest rank of non-commissioned officer among native troops in India and Ceylon.

Havre, Le (a contraction of the original name, Le Havre de Notre Dame de Grace), a seaport in the French department of Seine-Inférieure, and, next to Marseilles, the chief commercial emporium of the country, is situated on the north side of the estuary of the Seine, 143 miles NW. of Paris by rail. The port was entered in 1886 by 2580 vessels of 2,003,983 tons, and in 1888 by 2717 vessels of 2,341,023 tons, of which 1210 vessels of 825,892 tons were British and 645 vessels of 779,237 tons were French. These figures are

exclusive of 3112 (French) vessels of 379,777 tons and 3456 of 532,911 tons, in 1886 and 1888 respectively, engaged in the coasting trade. The chief imports are coals, wheat, cotton, dyewoods, coffee, hides, petroleum, wool, palm oil, alcohol, cocoa, and sugar. The exports consist principally of woollen and cotton goods, potatoes, salt, butter, paper, silks and ribbons, china ware, eggs, and ochre, in addition to 1½ million gallons of wine and nearly £280,000 worth of millinery. The customs duties levied amounted to £2,125,696 in 1888. Havre possesses excellent harbour accommodation, having nine separate dock basins (the ninth completed in 1887), with an area of 174 acres and 36,400 feet of quays. The port is very greatly handicapped in the struggle for commercial success by the paucity of railway connection and the height of the harbour dues. But the greatest drawback is the difficult approach to the harbour from the sea, owing to the shifting sandbanks that lie in the estuary. A very comprehensive scheme for improving the harbour and its approaches, and the lower course of the Seine, was put forward in 1889. It embraced the construction of a capacious outer harbour, protected by breakwaters, and provided with a new entrance from deep water, the building of protective dykes in the estuary, and very extensive dredging operations for the purpose of deepening the Seine up to Rouen. Meanwhile dredging is going on on a large scale just outside the harbour. Two new dry-docks were opened in 1889. Havre does not possess a fishing fleet. It is one of the chief ports in France from which emigrants set sail. The average of 30,000 rose in 1888 to 38,000, nearly one-third being French, with about the same number of Italians and one-fifth Swiss. Two-thirds were bound for the United States, the rest for the Argentine Republic. Amongst the local industries the first place is occupied by shipbuilding. Next come machine-factories, cannon-foundries, flour-mills, petroleum and sugar refineries, and dye-works. Havre has a hydrographical, an industrial, and a commercial-school, an influential chamber of commerce, and a tribunal of commerce. Its notable buildings include the 16th-century church of Notre Dame, a museum, a Renaissance town-house, a marine arsenal, &c. There are statues to Bernardin de St Pierre and Casimir Delavigne, both natives of Havre. The sanitary condition of the town is not so good as it should be. Nevertheless Havre is visited for its sea-bathing. Pop. (1876) 85,407; (1891) 116,369.

Down to 1516 Havre was only a fishing-village. Its history as a seaport dates from the reign of Francis I., who built the harbour and fortified it. Havre was held for some months in 1562 by the English, who were expelled by Charles IX. after a hot siege. Louis XIV. made it a strong citadel, and it was several times bombarded by the English in the 17th and 18th centuries. The town walls were demolished in the middle of the 19th century. Mdlle. de Scudéry was born at Havre. See histories by Morlent (1825) and Borély (1883).

Hawaii, Hawaiian Islands, or Sandwich Islands, a small archipelago in the North Pacific, till 1898 forming the kingdom of Hawaii (so called from Hawaii, the chief island of the group, and named Sandwich Islands by Captain Cook after Lord Sandwich, then First Lord of the Admiralty. The islands, twelve in number, form a rich, beautiful, and interesting chain which runs from south-east to north-west, and lies in 19° to 22° N. lat. and 155° to 160° W. long. Their total area is about 7000 sq. m., or about that of Wales. The names and areas of the eight principal islands (the other four being merely barren rocks) are as follows: Hawaii (the 'Owhyhee' of Captain Cook), 4210 sq. m.; Maui, 760; Oahu, 600; Kauai, 590; Molokai (the 'Lepers' Island'), 270; Lanai, 150; Kahulani, 63; Niihau, 97.



Hawaii is the southernmost of the group; it is in shape a rough triangle, with the apex pointing north-west.

Geography, Mountains, Rivers, &c.—The Hawaiian Islands are situated on the course of ships passing from San Francisco and Vancouver Island to China and Japan, as well as to New Zealand and Australia. They lie in mid-ocean, between the coasts of Asia and America, but are nearer to the American coast, from which they are about 2100 miles distant; they consequently form a convenient station for the coaling and repairing of vessels on their way across the Pacific. The islands are of volcanic origin, with coral-reefs partly lining most of them, but entirely encircling none. They suffer from want of good harbours, the best being the harbour of Honolulu, situated on the island of Oahu, with 22½ feet of water in its shallowest parts. This harbour, which is entered through a narrow channel in the reef, is the only really well-protected harbour in the group; during the time of the trade-winds, however, which blow from north-east to south-west for about nine months in the year, the roadsteads on the south shores of the islands afford safe anchorage almost anywhere. The larger islands are mountainous, and contain some of the largest volcanoes, both active and extinct, in the world. The two highest mountains, Mauna-Kea and Mauna-Loa, are in the island of Hawaii, and are 13,805 and 13,675 feet high respectively. This island is also traversed by other mountains, which give it a rugged and picturesque appearance, and in places bold cliffs from 1000 to 3000 feet high front the sea. Speaking generally, however, the high ground in each of the islands is in the centre, and the mountains are divided by rich valleys leading down to a sandy shore. On the eastern slope of Mauna-Loa, in Hawaii, is the far-famed Kilauea, the largest active volcano in the world. It is over 4000 feet above sea-level. Its crater is of oval shape, 9 miles in circumference, bounded by a range of cliffs, and containing within it a fiery lake of molten lava rising and falling like the waves of the sea. Mauna-Loa itself is an active volcano, the scene of various eruptions, notably of one in February 1877, when the glare caused by the fiery outburst is said to have been plainly visible on the island of Maui, 80 miles distant. On Maui is the crater of Haleakala ('house of the sun'), by far the largest known in the world. It is from 25 to 30 miles in circumference, from 2000 to 3000 feet deep, and is 10,032 feet above sea-level. Within this huge gulf are about sixteen basins of old volcanoes, whose ridges form concentric circles. Several of the islands, especially Hawaii and Kauai, are well supplied with rivers.

These afford great facilities for irrigation, but owing to the small size and the conformation of the islands they are in no case navigable.

Climate, Soil, &c.—Lying as they do in the middle of the Pacific Ocean, the Hawaiian Islands, though within the tropics, enjoy a fairly temperate climate. In the hot season the temperature seldom rises above 90° F., while in the cool season it seldom falls below 52° F., the average temperature for the year being 74·3° F. Rains, brought by the north-east trade-wind, are frequent on the side of the mountains which faces that quarter, but on the other parts of the islands little rain falls, and the sky is generally cloudless. The yearly rainfall at Honolulu, being on the leeward side of Oahu, is under 40 inches; that of the islands generally about 54 inches. The soil, whose constituent parts are mainly scoriæ, decomposed lava, and sand, is generally thin and poor, but at the bases of the mountains and in the valleys there are extensive tracts as fertile as they are beautiful. In Hawaii alone, on the Waimea plains, thousands of sheep of the merino breed find grazing ground; and on most of the islands, while the upland slopes of the mountains are clothed with dense forests, the lower levels spread into grassy plains rich with sugar and rice plantations.

Natural History, Products, &c.—The islands are separated from other lands by a broad expanse and great depth of sea, consequently their natural history has many special features of its own. In the high mountains there are some species of plants akin to those of the American continent. The forest-trees are mainly to be found on the windward, being the rainy side of the mountain-ranges. Tropical fruits are numerous. There are now, as has been stated, numerous sugar and rice plantations on the islands. The staple food of the natives consists of *poi*, a kind of thick paste made from the root of the *taro* plant (*Arum esculentum*) and raw or dried fish. The only indigenous animals are rats, mice, bats, dogs, and hogs, but others have been added since white men came to the islands; cattle, sheep, &c. having been introduced by Vancouver and other navigators. There are large numbers of semi-wild horses in the kingdom, and in some parts of the mountains wild dogs are also to be found. Reptiles are few, including on land one species of lizard and a few of the gecko; and the native birds, of which there were nineteen species, are rapidly disappearing, though foreign importations more than supply their place. The archipelago has unfortunately no mineral resources. Coral rock is the material chiefly used for building purposes, and to a less extent basalt, compact lava, and sandstone. There is a large variety of sea-shells, some of which are of exquisite beauty.

Trade, Finance, &c.—The commerce of the islands is gradually increasing. Up to the year 1876 the most important trade was that of the vessels engaged in the whale-fisheries of the Pacific, which now are almost extinct. In 1876 a Reciprocity Treaty was concluded with the United States, and since that date there has been an enormous development of the sugar export trade. Over 200,000,000 lb. of sugar, being eight-ninths of the total value of the exports, were grown and exported in some years, the other chief articles of export being rice, wool, molasses, coffee, hides, tallow, and bananas. The total value of produce exported from the islands ranges from $8,000,000 to $18,000,000 annually. The imports, which consist principally of dry-goods, reach about half that amount. Nine-tenths of the trade is with the United States. In the foreign carrying traffic some 300 vessels were employed in 1895, while about 60 Hawaiian ships ply between the different islands. On the larger islands there are good roads, and in the islands of Hawaii and Maui there are about 75 miles of railway, the first line having been opened in 1879. Telegraphs have been established in these two islands, and in Honolulu the telephone is in common use. The coins current in the islands are American dimes, quarter-dollars, half-dollars, and dollars. The estimated revenue of the kingdom fell between 1890 and 1895 from over $4,400,000 to under $3,700,000, the expenditure being calculated annually at a little less than the income. The chief sources of revenue are customs and internal taxes. The public debt in 1895 was $3,590,000.

History, Constitution, &c. The islands are said to have been discovered by Gaetano in 1542, and rediscovered by Captain Cook in the year 1778. Cook met his death at the hands of the natives in Kealakekua (Karakakoa) Bay in the year 1779. In early times each island had a king, but under Kamehameha I. the islands were formed into one kingdom. He died in 1819, and was succeeded by Liholiho, who adopted on his accession the name of Kamehameha II., and whose reign was famous for the abolition of idolatry simultaneously throughout all the islands. Vancouver, who arrived with Cook in 1778, and returned in 1792 and again in 1794, had made sincere attempts to enlighten the islanders, and succeeded so far that he was requested by the king and his chiefs to send out religious teachers to them from England. The first missionaries, however, who visited the islands came from the nearer shores of America. On their arrival in 1820 they witnessed the singular phenomenon of a nation without a religion. The instructions of Vancouver had, it would seem, not been forgotten, and had opened the eyes of the idol-worshipping natives to the grotesque absurdities of their system. But the spontaneous movement of 1819–20 'was no triumph of Christianity—for Christianity had not yet claimed or even approached the Hawaiian Islands.' The nation had voluntarily cast off the religion of their ancestors, and had not yet adopted—were not even acquainted with—any other system. The missionaries were well received, and the work of instruction was at once begun. In less than forty years they taught the whole Hawaiian people to read and write, to cipher and sew. Kamehameha II. and his queen visited England, and both died in London in July 1824. Prior to the year 1838 the government was a simple despotism, but in 1840 Kamehameha III. granted a constitution consisting of king, assembly of nobles, and representative council. In 1843 the independence of the Hawaiian kingdom was formally guaranteed by the French and English governments. Kamehameha IV. (1854–63) was succeeded by his brother Kamehameha V., with whose death in 1873 the line of the Kamehamehas became extinct, a high chief, Lunalilo, being elected to the vacant throne. On his death in 1874 another high chief, Kalakaua, was elected king. About 1886 the unsatisfactory state of the public finances under the existing system demanded some measure of reform, and in 1887 the king was called upon to dismiss his cabinet and constrained to grant a more popular constitution. In January 1893 the queen Liliuokalani, sister of Kalakaua I., who had reigned for two years, was dethroned by a revolution. Annexation to the United States failing through the opposition of President Cleveland, a Republic was inaugurated in 1894. In 1898, however, the islands were formally annexed to the United States, and in 1900 the territory of Hawaii was organised.

Population and Condition of the People. The total population of all the islands amounted in 1890 to 89,990, of whom 58,714 were males and 31,276 females. Of this total 34,436 were natives,

and among the foreign members of the community the most numerous element was the Chinese, numbering 15,301, mainly employed in working the sugar plantations; next to the Chinese, among foreign residents, came Portuguese, Americans, Germans, English, in the order given. The natives of the Hawaiian Archipelago belong to the brown Polynesian stock, and are akin to the New Zealand Maoris in race and language. They were once far more numerous than at present, having, it is said, at the time of Captain Cook's visit numbered probably some 200,000. There is no doubt that they have rapidly decreased, while the number of foreigners in the islands is continually increasing. Physically the Hawaiians are a remarkably fine and handsome race. In character they are indolent, joyous, and contented. The dress of the native men, where they have not adopted 'civilised' attire, consists merely of a wide strip of cloth round the loins, while the native women dress in a long ungirdled gown ('holoku') reaching from the neck to the ankles. Excellent day-schools have been established all over the islands, and there are very few natives who cannot read and write in their own language.

The decrease of the population is probably due in part at anyrate to the introduction of foreign diseases. At the present time, however, the disease most rife among the people is leprosy. It was not till the year 1865 that the Hawaiian government set aside the island of Molokai for the segregation of lepers in order to prevent to some extent the further spread of this terrible malady. Here they lived in a state of abject misery until the arrival of Father Damien (q.v.), whose work was taken up by others after his death in 1889. The prevention of leprosy is now attracting the serious attention of the Hawaiian government and their board of health; large numbers of lepers have been removed to the Molokai settlement, where over 1000 live.

See Mrs Bishop, *Six Months in the Sandwich Islands* (1875); Miss Gordon Cumming, *Fire Mountains* (1883); J. D. Dana, *Hawaiian Volcanoes* (1890); Sauvin, *Un Royaume Polynesien* (1893); Guillemard, *Malaysia and the Pacific Archipelagoes* (in Stanford's 'Compendium,' 2d ed. 1895); Staley, *Five Years' Church Work in Hawaii*; Manley Hopkins, *Hawaiian Islands*; Thrum, *Hawaiian Almanac and Annual*; the *Narrative of the Cruise of the Challenger*; the *Statesman's Year-book*, &c.

Hawarden (pronounced *Harden*), a small market-town of Flintshire, North Wales, 7 miles W. of Chester. There are some manufactures of tiles, pottery, &c. Lady Hamilton passed her girlhood here. The church, almost destroyed by fire in 1857, was restored from designs by Sir G. G. Scott. Hawarden Castle, Mr Gladstone's seat, dates from 1752. The park contains the ruined keep of a 13th-century castle commanding a fine view of the Dee. Pop. of parish, 7057.

Hawash, a river of Abyssinia (q.v.).

Hawes, STEPHEN, born probably in Suffolk, was groom of the chamber to Henry VII., and wrote, besides some half-dozen other works in prose and verse (now bibliographical rarities), *The Passetyme of Pleasure* (first printed by Wynkyn de Worde in 1509), a prolix poem not without fine stanzas, which doubtless helped to inspire Spenser. There have been reprints in 1831, 1845, &c. Hawes died probably in 1523.

Hawfinch (*Coccothraustes vulgaris*), a bird of the Grosbeak (q.v.) genus and the Finch family (Fringillidæ). It is considerably larger than the chaffinch; the adult male has the crown and back chestnut-brown, the neck and breast pale brown, the neck crossed at the back by a broad band of ash colour, wings partly black, greater wing-coverts grayish-white, lesser wing-coverts black or blackish-brown. The hawfinch is a very shy bird, perching on the topmost branches of trees, or on open boughs where it can command a good lookout, and avoiding man unless subdued by the effects of hunger or cold. It is gregarious. It feeds on the fruit of the hornbeam, plum, pine, cherry, laurel, holly, hawthorn, &c. It is not uncommon in some parts of England, but is rare in Scotland. It is widely distributed over Europe and the temperate parts of Asia, and is said to be found in Egypt.

Hawick, a manufacturing town of Roxburghshire, at the confluence of the Slitrig with the Teviot, 52 miles by rail SSE. of Edinburgh and 45 NNE. of Carlisle. Built in and round a hollow, with villas and mansions above, it is a place of hoar antiquity, but bears few traces thereof beyond the Moat, an artificial earthen mound 30 feet high and 312 in circumference, and part of the Tower Hotel, which, once the peel-tower of the Drumlanrig Douglases, and later a residence of Monmouth's widowed duchess, was the only building not burned by the Earl of Sussex in 1570. In the neighbourhood are Branxholm and Harden, old homes of the Scotts; and, older than either, there is the refrain of the June Common-riding song, 'Teribus ye Teri Odin,' which carries us back to days of heathendom. Else, all is modern—the handsome municipal building (1885); the churches, more than a dozen in number, and the oldest (1214) rebuilt in 1763; the splendid water-supply (1865–82); and the hosiery and tweed mills, to which, with dye-works, tanneries, &c., Hawick owes its prosperity. The hosiery manufacture dates from 1771, and that of shepherds' plaids, tweeds, blankets, &c. from 1830. The ancient municipal constitution of the burgh, based on a charter granted by Sir James Douglas of Drumlanrig in 1537, and confirmed by Queen Mary in 1545, was reformed by special act of parliament in 1861; and since 1867 Hawick, Selkirk, and Galashiels (the Border burghs) have returned one member. Pop. (1861) 10,401; (1881) 16,184; (1891) 19,204. See two works by James Wilson (1850–58), and Mrs Oliver's *Upper Teviotdale and the Scotts of Buccleuch* (1887).

Hawk, a name often given to almost all the Falconidæ, except the largest eagles, but also used in a more restricted sense to designate the Accipitrine section of the family, and for the most part referable either to the goshawks (Astur) or the sparrow-hawks (Accipiter). Unlike the true falcons, they have an untoothed bill. The wings are short, somewhat rounded, and very concave beneath, and while the flight is rapid it is without much power of soaring or gliding. See FALCONIDÆ, GOSHAWK, SPARROW HAWK.

Hawkbit (*Leontodon*), a genus of plants of weedy aspect belonging to the natural order Compositæ, closely related to and formerly united with Dandelion (q.v.), from which it has been separated on account of the feathery pappus. The name is due to the deep tooth-like lacerations of the leaves. Several species are natives of Britain, and these, along with a few others comprised in the genus, are widely distributed in Europe and Russian Asia.

Hawke, SIR EDWARD, LORD HAWKE OF TOWTON (1705–81), was the son of a lawyer of good middle-class stock. He was born in 1705 in London, and entered the navy while very young. The long quiet which followed the peace of Utrecht gave him no opportunity of seeing active service. He, however, attained the rank of commander in 1733. In 1744 he commanded the *Berwick* (70 guns) in the fleet under Admiral Mathews which was lying at Hyères Bay to watch the combined French and Spanish fleets in Toulon.

In the disgracefully-conducted battle of the 11th February of that year the *Berwick* was one of the few ships which were handled with spirit. Hawke followed his admiral in bearing down out of the line of battle to attack the Spanish ships which formed the rear of the allied fleet. This movement was considered irregular according to the pedantic tactical rules of the time, and, conjoined with his own violent conduct to his subordinate Lestock, proved ruinous to Admiral Mathews. But Hawke established his reputation as a daring officer. The Spanish line-of-battle ship, the *Poder*, the only vessel captured, surrendered to the *Berwick;* and it was not Hawke's fault that she was retaken by the enemy. In 1747 he was made rear-admiral of the white squadron, and the same year was despatched with a fleet of fourteen sail to intercept a French convoy of 252 merchant ships known to be leaving for the West Indies. On the 14th October Hawke caught the convoy off Cape Finisterre. It was guarded by a squadron of nine ships of war under M. L'Etenduère. The French admiral formed line of battle, and fought heroically to save his charge. The odds were great—fourteen English ships with 784 guns to nine French with 556—and after desperate fighting six of L'Etenduère's ships struck. But he saved his convoy, which fled during the battle. In the same year Hawke became member of parliament for Bristol. By 1755 he had attained the rank of full admiral. In the following year he was sent out to supersede the unhappy Byng, who had just disgraced himself and his country at Minorca. There was, however, nothing to do in the Mediterranean. During 1757 and 1758 he was in command in the Channel directing the naval half of the combined operations on the French coast sent out by the elder Pitt. His great feat—one of the greatest ever performed by a British admiral—came in 1759. During that year the French were preparing fleets at Brest and Rochefort to cover an invasion of England. The Brest fleet, the more powerful of the two, under the command of M. de Conflans, consisted of twenty ships carrying 1412 guns. It was watched by Hawke with a fleet of twenty-three ships carrying 1666 guns. On the 14th November the English fleet was driven off its station by a succession of furious gales, and M. de Conflans seized the chance to slip to sea. Hawke, who had anchored at Torbay, had, however, left lookout frigates, by whom he was informed of the sailing of the French admiral. Concluding at once that M. de Conflans would make for Rochefort, Hawke steered to cut him off at Quiberon. His calculation proved accurate. On the 20th November he caught the French, and, although it was blowing a fresh gale, attacked at once. The battle was one of the most heroic ever fought on sea. In a gale of wind, on the afternoon of a November day, and with one of the most terrible coasts in the world under his lee, Hawke forced on a close action. A famous story tells how his sailing-master expostulated at the order to take the flagship, the *Royal George* of 100 guns, into the dangerous Bay of Quiberon in such a gale and in the dark, and how Hawke replied: 'Mr Robinson, you have done your duty in pointing out the danger; you are now to obey my orders, and lay me alongside the French admiral.' The result was the destruction of the French fleet, and the collapse of the invasion scheme. It is curious that Hawke, who had been made a knight for the capture of L'Etenduère's squadron, did not receive the peerage this victory so well deserved till 1776, when he was made Baron Hawke of Towton. It is just possible that the freedom with which he rebuked the Admiralty for its management of the fleet may have had something to do with the delay. He was First Lord himself in the administration of 1765, but had no further chance of distinguished sea service. He died at Shepperton, Middlesex, 17th October 1781. See the excellent Life by Professor Captain Montagu Burrows (1883).

Hawker, Robert Stephen, the Cornish poet, was born at Plymouth, December 3, 1803. His father, then a physician, afterwards took orders; his grandfather, the Rev. Robert Hawker, D.D. (1753–1827), the author of the well-known *Morning and Evening Portions*, was for fifty years a vicar in Plymouth. He was a bright boy, notable especially for high spirits and an inveterate love for practical jokes. He had his education at Liskeard and Cheltenham grammar-school, and entered Pembroke College, Oxford, in 1823; but his father, now a curate, soon found himself unable to keep him at Oxford. Fortunately this difficulty was obviated by the lad's own marriage (November 1824) to a lady of some fortune. He was not yet twenty-one, while his wife, Miss Charlotte T'Ans, who had been his godmother, was forty-one. With her he returned to Oxford, migrating to Magdalen Hall. He carried off the Newdigate in 1827, took his B.A. in the following year, was ordained priest in 1831, and was presented by Bishop Phillpotts in 1834 to the vicarage of Morwenstow, a small village on the wild north Cornish coast, 6 miles N. of Bude Haven. Here he laboured with devotedness for forty years, lavishing charity from his slender means upon shipwrecked mariners and his own poor alike. There had been no resident vicar for a hundred years, the quaint old church and the vicarage were in ruins, and the parishioners were demoralised by generations of wrecking, smuggling, and spiritual ignorance. Hawker rebuilt his vicarage, restored his church, roofing it anew with shingles in spite of all advice and opposition; built and maintained a school; introduced the strange innovations of a weekly offertory and a harvest-thanksgiving, as well as a striking ceremonial largely of his own devising, and more often suggesting the usages of the Eastern than the Western Church. Yet he never felt any affinity with the modern Ritualists, but indeed he was in every sense a man difficult to class. His zeal was hot against Wesleyanism and every form of dissent, for his sympathies did not range wider than his knowledge. He himself shared many of the superstitions of his people, believing in the manifestations of spirits and in the influence of the evil eye. The spiritual world was very near and real to him: St Morwenna was no mere member of the choir invisible, but an influence that could still affect his everyday life. All his eccentricities were redeemed by his humanity, his humour, and his tender love for children and for animals. His manner in preaching is described as rapt and awe-inspiring; but his theology sadly lacked logic and consistency. The theologian cannot afford to allow his judgment to be dominated by fancy, but in poetry the case is altogether different. Here Hawker is absolutely delightful, with simple unsought pathos and exquisite imagery moulded into faultlessly graceful form. He has both the gifts of sweetness and sonority, and withal manly strength and vigorous phrase at will. His *Tendrils by Reuben*, published at seventeen, he had the good sense not to reprint; but by his Cornish ballads in *Records of the Western Shore* (1832; a second series in 1836) he stamped himself unmistakably a poet. These were republished in *Ecclesia* (1840); with some additions, as *Reeds shaken by the Wind* (1843; a second cluster in 1844); and yet again, along with *Genoveva*, in *Echoes of Old Cornwall* (1846). In 1869 he republished his earlier poems in *Cornish Ballads*, and the *Quest of the Sangreal*—the latter had already appeared in 1863. His *Footprints of Former Men*

in Cornwall, 1870) was a collection of miscellaneous papers on local traditions. None of Hawker's poems is better known than his spirited ballad based on the old Cornish refrain 'And shall Trelawney die?' which both Sir Walter Scott and Lord Macaulay took at first for a genuine antique.

Hawker's wife died in February 1863—a blow which drove him to melancholy and opium, from which he was saved only by his marriage (December 1864) to Miss Pauline Kuczynski, daughter of a Polish refugee by an English mother, and then a governess in a clerical friend's house. She bore him three daughters, and nursed his declining years with rare devotion. Hawker died at Plymouth, 15th August 1875, having been admitted less than twelve hours before to the Roman Catholic communion.

The biography by the Rev. S. Baring-Gould (1876; 4th ed. 1899), was severely attacked by some critics, and certainly contains irrelevances enough; much less satisfactory, however, is the *Memorials*, by the Rev. F. G. Lee (1876). A complete edition of Hawker's poems was edited in 1879, with a sensible short life, by his friend J. G. Godwin, who also edited his prose works (1893).

Hawkers, also called PEDLARS, or PETTY CHAPMEN, persons who go from town to town, or door to door, selling goods, wares, or merchandise, or exercising their skill in handicraft. A considerable change has been made by recent legislation in regard to this class. Those pedlars exercising their calling entirely on foot have been separately dealt with from hawkers who employ one or more beasts of burden in their business. The foot pedlars are placed under the surveillance of the police, and are exempt from excise duty. Under the Pedlars Act, 1871, any person whatever who can satisfy the chief officer of police of the police district in which he resides that he is of good character, is above seventeen years of age, and has resided during the previous month in the district, will receive, on due application, a certificate valid for a year, on payment of five shillings. The Pedlars Act, 1881, provides that such a certificate shall entitle the holder to exercise his calling in any part of the United Kingdom. The police have power at any time to open and search the packs, &c. of any certificated pedlar, with a view to prevent dishonesty and smuggling, &c., for which they have much opportunity. They have an appeal to the local Justice of Peace and other courts against oppression by the police.

Hawkers who use beasts of burden, and hawkers who go from place to place, hiring rooms or booths for the exhibition of their wares, are in a different category. The Hawkers Act, 1888, requires them to take out an annual or half-yearly license from the excise, which is valid all over the kingdom. These licenses are at the rate of £2 per annum; new licenses are granted only on a certificate of good character. A hawker is in no case entitled to sell spirits, but he may sell tea and coffee. He must not sell plated goods without taking out a plate license, nor must he sell by auction without an auctioneer's license. Any person hawking unprovided with a license, or who refuses to produce the license to any person who calls for it, is liable to penalties under the Act of 1888. Commercial travellers, book-agents, sellers of fruit, fish, victuals, or coal, also sellers in fairs or markets legally established, do not require either licenses or certificates, though it must be sometimes difficult to define whether a seller comes within the category of a pedlar or hawker.

In the United States hawkers are generally required to take out licenses, under the local laws of the several states, the charges of course varying. Moreover, in some states and territories, as Florida and Arizona, and in the District of Columbia, 'drummers' or commercial travellers must pay a license of from $25 to $200; while in Pennsylvania it is a misdemeanour to sell goods unless either the agent or his principal be a taxpayer of the state. But in many states no such law has ever been enacted, and in others, as in Montana and Nevada, similar acts, although on the statute-book, are held to be unconstitutional and are not enforced.

Hawke's Bay, a provincial district of New Zealand, on the east coast, between Auckland and Wellington. Area, 4765 sq. m.; pop. (1886) 24,568. It presents rich alluvial plains and undulating hills, with enormous forests. The bay known as Hawke's Bay was first entered by Captain Cook on 8th October 1769, and was so named after Sir Edward Hawke, then First Lord of the Admiralty. It is almost all suitable for farming, and the forests are of enormous extent. Napier (q.v.) is the port and chief city.

Hawkesbury, a river of New South Wales, rises in the Cullarin Range, and under the names of Wollondilly and Nepean flows NE., then turns as the Hawkesbury SE., and enters the Pacific at Broken Bay, about 20 miles NE. of Sydney. It has a total length of 330 miles, and is navigable for vessels of 100 tons as high as Windsor. The Hawkesbury is crossed by a steel girder bridge (1886–89) on the railway between Sydney and Newcastle. It carries a double line of rails, and is one of the largest structures of its kind in the world, having seven spans of from 410 to 416 feet, and a total length between abutments of 2900 feet. The bridge completes the system of railway communication between Brisbane and Adelaide.

Hawkesworth, JOHN, miscellaneous writer, was born in London, probably in 1715, but according to another account in 1719. Little is known of his early life, but he is said to have been apprenticed successively to a clockmaker and to an attorney; and for his education he was mainly indebted to his own perseverance. In 1744 he succeeded Dr Johnson on the *Gentleman's Magazine;* and in 1752 he started, with Johnson and others, a successful periodical called *The Adventurer*, half of whose 140 numbers were from Hawkesworth's own pen. As a reward for its services in the cause of morality he received from the Archbishop of Canterbury the degree of LL.D. He afterwards published a volume of fairy tales (1761), and an edition of Swift's works and letters, with a Life that Johnson praised highly; and he was chosen by Captain Cook to prepare the account of his first voyage, which formed vols. ii. and iii. of Hawkesworth's *Voyages* (3 vols. 1773), for which work the editor received £6000 from government. He died on 17th November 1773. Hawkesworth was too ardent an admirer of Johnson to attempt consciously to imitate him or to avoid doing so unconsciously. Yet his chief service to literature was that he introduced into the popular oriental fictions of the 18th century the ease of familiar writing, and so put an end to the long succession of dreary and bombastic narratives that strutted far behind in the track of *Rasselas*.

Hawking. See FALCONRY.

Hawkins, SIR JOHN, an English navigator, was born at Plymouth about 1532. He has the unhappy distinction of being the first Englishman that trafficked in slaves (1562). His 'commercial' career closed with his disastrous third voyage (1567), after which we find him more honourably employed. He was appointed treasurer of the navy in 1573, knighted for his services against the Spanish Armada in 1588, and for the rest of his life was engaged in making havoc of the Spanish West Indian trade. In 1595, along with his kinsman Drake, he commanded an expedition directed against the settlements in the Spanish Main, but

died at Porto Rico, November 21, in the same year. See Hakluyt's *Voyages* (iii.) and Purchas's *Pilgrimes* (iv.).

Hawkins, Sir John, author of the *History of Music*, was born at London, 30th March 1719, the son of a surveyor, and a descendant of the famous admiral. Bred an attorney, he acquired a fortune through his wife, and withdrew from professional work; and, becoming an active magistrate, was knighted for his services in connection with riots in 1768 and 1769. He collected a most valuable musical library, and after sixteen years of laborious research produced in 1776 his *General History of the Science and Practice of Music*, in 5 vols. quarto a work of admittedly great and accurate scholarship, somewhat unsystematic and tedious, and as a literary performance decidedly inferior to Burney's History (which began to appear at the same time). It was much abused and ridiculed, but is a work of permanent value, and was reprinted in 2 vols. in 1876. In 1760 Hawkins issued an edition of Walton's *Angler*. An original member of Dr Johnson's Ivy-lane Club, Hawkins became on Johnson's death his literary executor, and published in 1787 a *Life of Dr Johnson* and an edition of his works. He died 21st May 1789.—His son, John Sidney, published a history of Gothic architecture; his daughter, Lætitia, her own *Memoirs*, with many anecdotes of Dr Johnson.

Hawk-moth (*Sphingidæ*), a family of lepidopterous insects, forming along with the clear-winged moths (Ægeriidæ) and the burnets and foresters (Zygænidæ) the tribe Sphinges. They have stout bodies, large heads with prominent eyes, and stout short antennæ. The wings are long, narrow, more or less pointed, and have always a retinaculum. They are insects generally of rapid flight, and fly about in the twilight; some species also during the day. Their caterpillars are sixteen-legged, flat, smooth, often green, with transverse stripes on the sides and nearly always a horn on the back of the second last segment. They change to pupæ either on the surface of the ground or in a cell underground which they form for the purpose. The common species of the Humming-bird Hawk-moth (*Macroglossa stellatarum*) in Britain has brown fore wings and reddish tawny hind wings, and, unlike all other hawk-moths except the Bee Hawk-moths (*Hemaris* or *Sesia fuciformis* and *bombyliformis*), has a spreading tuft of hairs at the end of the body. Most of the foreign species are similarly coloured; and some of the South American species resemble humming-birds so closely that they cannot on the wing be distinguished from them, the natives there and even educated whites firmly believing that the one is transmutable into the other. Smerinthus is the only genus of the British hawk-moth with dentated wings. One of the most remarkable hawk-moths is the Death's-head (q.v.) (*Acherontia atropos*), the largest moth found in Britain. It sometimes measures nearly six inches across the wings; the fore wings are brown, the hind wings pale brown with black bands; and on the back of the thorax is a pattern in gray and black having a certain resemblance to a skull. The Privet Hawk-moth (*Sphinx ligustri*), the type of the family, measures about four inches across the fore wings, which are of a pale brown colour with darker markings; the hind wings are pale pink crossed by three black bands. Its green caterpillar, with white and lilac streaks on the sides and a black horn on the back, feeds on privet and lilac, and the position it assumes when resting suggested that of the mythological Sphinx to the old naturalists, who applied this name to the insect.

Caterpillar of Humming-bird Hawk-moth (*Macroglossa stellatarum*).

Humming-bird and Humming-bird Hawk-moth (*Macroglossa stellatarum*) (after Bates).

Hawks, Francis Lister, an American clergyman, born at New Berne, North Carolina, 10th June 1798, practised law for a time with success, but in 1827 was ordained to the Episcopal ministry. He was professor of Divinity at Washington (now Trinity) College, Hartford, in 1830–31, and afterwards rector of churches in New York, New Orleans, and Baltimore. He died in New York, September 26, 1866. In 1836 he went to England, and there obtained 18 folio vols. of MSS. relating to the Episcopal Church in America, of which he had been appointed historiographer. In 1836–39 he published 2 vols. of *Contributions to the Ecclesiastical History of the United States*, dealing with Virginia and Maryland. Among his other works are a *Commentary on the Constitution and Canons* (1841), and, with Bishop Perry, *Documentary History of the Protestant Episcopal Church* (vols. i. and ii. 1863–64); and he edited Alexander Hamilton's state-papers (1842), Commodore Perry's *Expedition to Japan* (1852–54), and Appleton's *Cyclopædia of Biography* (1856).

Hawksbeard (*Crepis*), a genus of annual and biennial plants belonging to the natural order Compositæ, so closely related to Hawkweed (Hieracium) that some of the species are referred to the one genus or the other according to the peculiar views of individual botanists. The species are widely distributed through Europe and Asia.

Hawksbee, or Hauksbee, Francis, physicist, was already a well-known experimentalist when in 1705 he was admitted a Fellow of the Royal Society, and he died soon after 1713. (Not to be confused with him is Francis Hawksbee the younger, 1687–1763, apparently his son, who was also an electrician and skilled instrument-maker, and was in 1723 appointed clerk and housekeeper to the Royal Society.) Hawksbee the elder carried further the tentative observations by Dr Gilbert and Boyle on the subject of electricity, and by his experiments laid the scientific foundations of that branch of knowledge. He contributed forty three memoirs to the *Philosophical Transactions*, chiefly on chemistry and electricity, between 1704 and 1713. His chief independent work, published in 1709, was entitled *Physico-Mechanical Experiments on various Subjects, touching Light and Electricity, producible on the Attrition of Bodies*. He is also well known as the improver of the earlier air-pumps

of Boyle, Papin, and Hooke, and as the first who used glass in the electrical machine.

Hawkweed (*Hieracium*), a genus of plants of the natural order Compositæ, sub-order Cichoraceæ. The species are perennial herbs of no popular interest with the exception of the Orange Hawkweed (*H. aurantiacum*), a native of the south of Europe, which on account of its handsome orange flowers is frequently cultivated in gardens. The popular name is founded on an ancient belief that birds of prey used the juice of the species to strengthen their vision. The English name *Hawkweed*, the German *Habichts-kraut*, and the French *Épervière* all testify to this curious belief having been formerly universally entertained.

Orange Hawkweed (*Hieracium aurantiacum*).

Hawkwood, SIR JOHN, Italianised L'ACUTO or L'AGUTO, an English captain who won great renown and much riches as a condottiere in Italy in the wars of the 14th century, was the son of a well-to-do tanner of Sible Hedingham, in Essex. Having embraced the calling of arms, he distinguished himself at the battles of Crécy and Poitiers, thereby winning the favour of the Black Prince; he was knighted by Edward III. After peace was signed at Bretigny (1360) he gathered a band of mercenary soldiers and led them to Italy, where he at first took service with Pisa against Florence. Then, after fighting in most of the petty Italian wars of the period, notably for the Visconti and for Pope Gregory XI., he agreed to fight the battles of Florence in return for an annual pension. His last years were spent in the neighbourhood of Florence, and there he died in 1394, and was honoured with a magnificent public funeral. See Nichol's *Bibl. Topog. Brit.*, vol. vi.; Temple Leader and Marcotti's *Life* (Eng. trans. by Mrs Leader Scott, 1889); and *Quarterly Review* (Jan. 1890).

Haworth, a moorland village in the West Riding of Yorkshire, 4 miles SSW. of Keighley by a branch-line. The old church has been ruthlessly demolished, but in the churchyard are the graves of Charlotte and Emily Brontë. Pop. 3816. See *Haworth, Past and Present* (Bradford, 1889).

Hawse (akin to Icel. *hals*, 'the neck'), part of a vessel's bow, in which the *hawse-holes* are cut. Through the hawse-holes the cables pass which hold a vessel when she is moored with two anchors out forward—one on the starboard, the other on the port bow.—*Hawser* is a small cable or a large rope.

Hawthorn (*Crataegus oxyacantha*: see CRATÆGUS), a shrub or small tree, a native of Europe, Siberia, and the north of Africa, common in Britain, and much planted both for hedges and for ornament. It varies in height from 6 or 8 to 20 or 25 feet. It has roundish obovate three- to five-lobed deciduous leaves, and corymbs, generally of white, rose-coloured or sometimes deep crimson flowers, succeeded by a small red fruit (*haws*) with yellow pulp, the central stony part bearing a very large proportion to the pulp. There are many varieties of hawthorn, and, curiously enough, some have only one style, whilst some have several. The variety called Glastonbury Thorn—because supposed to have originated at Glastonbury (q.v.)—is remarkable for its early flowering, which often takes place in the middle of winter, whilst the common kind is not in flower till May or June. The winter flowers of the Glastonbury variety are, however, not generally followed by fruit, and a second flowering often takes place in the same year. The common hawthorn is often popularly called *May*, from the season of its flowering in England. It is also called *Whitethorn*, in contradistinction to the Sloe or Blackthorn. The perfume of the blossoms is strong but delicious. The use of the hawthorn for hedges is almost universal in Britain. It has also sometimes been employed as a stock on which to graft apples and other Pomaceæ. Several double-flowered and select single-flowered varieties are propagated by budding and grafting for the adornment of lawns and pleasure-grounds. A fermented liquor, which is very intoxicating, is made from the fruit in many parts of France. For the Cockspur Thorn of North America, and the Pyracanth Thorn, see CRATÆGUS.

The hawthorn is particularly valuable as a hedge-plant, in consequence of its strong and plentiful spines, its long life, and its ready adaptation to very various soils. For this purpose it is propagated by seed: the haws are laid in a heap to rot, with a mixture of sand or fine mould, and, in a year or sixteen months after, the seeds are sown in ground carefully prepared. The young plants are kept clear of weeds, and often grow to the height of a foot or two feet in the first season (see HEDGE). Hawthorn hedges bear trimming very well. Young hawthorn plants are called *quicks* or *quicksets*, because used to make living (*quick*) fences.

An old English tradition regards Christ's crown of thorns as made of hawthorn; for the same reason the French call it 'l'épine noble.' In south Germany the tradition pointed to blackthorn, as elsewhere to some kind of buckthorn. Whitethorn was much favoured by fairies, old and lonely thorn-trees being regarded as their trysting-places.

Hawthorne, NATHANIEL, American author, born July 4, 1804, at Salem, Massachusetts. He was descended from English Separatist stock, and the character of his ancestry seems to have made an early and enduring impression on his thoughts. This impression did not lead him to follow out and exemplify in his own career their modes of action, but rather caused him to turn and reflect upon the nature of his predecessors and the conditions amid which they lived. Probably we owe to this inclination the singular interest and penetrating quality of vividness with which he imbued his scenes from early New England life; and the intensity of concentration which he applied in dealing with moral problems in his romances reveals in him the character of the modernised Puritan. The first American Hawthorne (or, as the name was then spelled, Hathorne) was William, who migrated from England (Wiltshire?), in 1630, to Salem in New England, where he became a leader of the colonial soldiery and a magistrate, distinguished for both bravery and eloquence. 'The figure of that first ancestor,' wrote Hawthorne, in his sketch of The Custom-house, 'invested by family tradition with a dim and dusky grandeur, was present to my boyish imagination as far back as I can remember.' William Hawthorne took part in the persecution

Copyright 1890 in U.S. by J. B. Lippincott Company

of the Quakers. His son John, also a military officer and magistrate, presided at the famous trials of the Salem witchcraft cases. Daniel, the author's grandfather, was a member of an American regiment, and also commanded a privateer, in the war of the Revolution against Great Britain.

Daniel's son Nathaniel, 'a silent, reserved, severe man, of an athletic and rather slender build, and habitually of a rather melancholy cast of thought,' became a captain in the merchant marine; the family having suffered a decline of fortune, and the male members mostly following the sea. He died when his son Nathaniel, the subject of this article, was but four years old. His widow, a woman of great refinement and religious sensibility, lived always afterwards in close retirement and straitened circumstances, with her two daughters and her son Nathaniel, who, from his ninth to his thirteenth year, was somewhat confined by an accidental lameness. His intense love of reading was doubtless fostered by these conditions. At fourteen he went with his mother to a lonely farm in the woods of Raymond, Maine; forming there, as he thought, that habit of solitude which became one of his permanent traits, but was probably inherited in part from his father. He was, however, a healthy, happy lad, given to outdoor sports and exercise, and quite free from morbidness in spite of his fondness for solitude. In Raymond he began to keep note-books, recording his observations; a practice which he resumed in later life and continued through the greater part of his career. At Bowdoin College, where he graduated in the class of 1825, with the poet Longfellow, he took a good rank, and gave pronounced signs of his tendency to authorship, having begun his first novel during his undergraduate course. But the conditions in the United States were at that period unfavourable to authorship as a profession, and his progress was slow. After his return to Salem he shut himself up for twelve years 'in a heavy seclusion,' writing tales and verses. Of the latter few have survived. In 1828 he published anonymously his first novel, *Fanshawe*, which was unsuccessful. Continuing to contribute to annuals and magazines, under various pseudonyms that made it still more difficult for him to become known, he edited in 1836 a short-lived periodical for S. G. Goodrich, for whom also he wrote *Peter Parley's Universal History*, an enormously profitable publication, of which Goodrich figured as the author and took the proceeds, while Hawthorne received only one hundred dollars.

Meanwhile some of his short fictions had gained such favourable notice from the London *Athenæum* that in 1837 a group of them, to which he gave the name *Twice-told Tales*, was issued in one volume, the risk of which was assumed, without the knowledge of Hawthorne, by his friend and classmate, H. N. Bridge. This book, which an impartial and competent critic has said 'marked a distinct epoch in American literature,' was reviewed with high praise by Longfellow, and substantially made the beginning of Hawthorne's fame. Yet he still had long to wait for its fulfilment. The full force of the new author's genius was by no means appreciated in his own country; and diligent though he was with his pen, he was still unable to live by it. In January 1839 the historian Bancroft, then collector of the port of Boston, appointed him weigher and gauger in the custom-house, which post he held until early in 1841. In April he allied himself with an industrial association at Brook Farm (q.v.), near Boston, founded by Dr George Ripley (afterwards a distinguished critic), with a number of highly cultivated men and women, among whom were George William Curtis, Charles A. Dana, and Margaret Fuller. The object was to establish an idyllic, semi-socialistic community, in which every member should do manual labour and share profits in common, while carrying on his or her chosen intellectual work, and maintaining in the community a separate single or family life. Hawthorne, who was about to marry, had some hope of making his home here, but finding the experiment unsatisfactory he withdrew. Meanwhile he wrote and published in three parts a series of simple stories for children, from New England history—viz. *Grandfather's Chair*, *Famous Old People*, and *Liberty Tree* (1841). In July 1842 he wedded Sophia Amelia Peabody, of Salem, his union with whom became one of the rarest and most beautiful chapters in the annals of happy marriages. No account of Hawthorne would be complete which failed to lay stress upon his marriage to this lady, who, as their son Julian has written, 'was a blessing and an illumination wherever she went; and no one ever knew her without receiving from her far more than could be given in return.'

Removing to Concord, Massachusetts, he issued *Biographical Stories* (1842) for children, brought out an enlarged two-volume edition of the *Twice-told Tales* (1842), and lived for four years in the old colonial manse, previously occupied by the ancestors of Ralph Waldo Emerson, and by Emerson himself, overlooking the field of the first battle of the Revolution. Here he dwelt happily, preserving his old custom of comparative isolation, and, seeing but little of his famous neighbours Emerson and Thoreau. He wrote many sketches and studies for the *Democratic Review*. These formed the *Mosses from an Old Manse* (1846). But he was poorly paid, or not at all. The *Review* failed; and, as he had lost all his previous savings invested at Brook Farm, he was forced to leave this home, and accept a place in the custom-house again—this time as surveyor, in his native town, Salem. The place was uncongenial, and for nearly four years he remained silent as an author. But by the expiration of his term he had completed (February 1850) *The Scarlet Letter*, which at once gained great renown, and still remains perhaps the best known of his works. It did not, however, bring him pecuniary ease. Hiring a small house at Lenox, Massachusetts, he entered upon a phase of remarkable productivity, showing that he had needed only encouragement and recognition to bring his powers into full play. At Lenox he wrote *The House of the Seven Gables* (1851), which added to his celebrity and popularity; also *The Wonder Book*, a recast of classic legends for children (1851); and prepared *The Snow Image*, which was not published until 1852. In the winter he wrote at West Newton *The Blithedale Romance*, which incidentally drew colouring from the Brook Farm episode, though in no way attempting to depict it as a fact. Having bought at Concord a small house, which he christened 'The Wayside,' he settled there in the summer of 1852, and wrote a Life of General Franklin Pierce, his old college friend, who had been nominated for the presidency of the United States. Immediately afterwards he completed *Tanglewood Tales*, a continuation of *The Wonder Book*; but this appeared first in 1853.

Pierce, on his inauguration as president in March 1853, named Hawthorne to be consul at Liverpool, a lucrative office which his experience in the custom-house qualified him to fill. The appointment was confirmed by the senate; and although Hawthorne had resolved to accept nothing from the president, and much persuasion had to be used to change his mind, he finally took the appointment, and sailed for Liverpool, midsummer, 1853. He held the consulate until near the close of 1857, attending closely to his duties, but spending part of the time in London, and visiting various portions

of England and Scotland. A sojourn of a year and a half in Rome and Florence, beginning January 1858, supplied him with the materials for a new romance, *The Marble Faun*, better known in England as *Transformation*, which he wrote at Redcar, Yorkshire, in the autumn of 1859, and published in 1860. In June of this year he returned to Concord, where approaching ill-health, and the mental depression caused by the outbreak of civil war in the United States, impeded his efforts at literary composition. He wrote, however, a number of brilliant papers embodying observations and experiences in England, which were printed in the *Atlantic Monthly*, and then issued in the volume *Our Old Home* (1863). He also began a new romance, founded on the idea of an elixir of immortality. It remained unfinished at his death, which occurred in the night of May 18, 1864, at Plymouth, New Hampshire, whither he had gone on a journey in search of health, with his friend ex-president Pierce. He was buried at Concord, Massachusetts, May 24, in a spot near which are the graves of Emerson and Thoreau.

In his style he early developed that maturity of dignified composure, free from constraint or affectation, and that lucid expression, which are among its most characteristic traits. With little faculty for the harmonies of verse, he had a singular command over the musical qualities of prose, enabling him to produce periods remarkable for their sonorous richness and delicate cadences, that sometimes raise them almost to the plane of poetry, yet never destroy their character as prose by interpreting the actual rhythms of verse. Although exceptionally fitted for conveying subtleties of thought and fantasy, his style is equally adapted to the comprehension of children, being invariably clear, and strongly marked by common sense. Another noticeable peculiarity is that, in the entire range of his writings, quotation is almost never resorted to: the author's mind being apparently so self-centred that its originality felt no need of aid or illustration from other writers. The superlative merits of Hawthorne's style were but slowly recognised in his own country; but his fame has rapidly and steadily increased since his death. Several of his works have been translated into foreign languages; and he is now generally esteemed as one of the greatest imaginative minds of the century, holding a place in the first rank among masters of modern English prose.

The personal appearance of Hawthorne was tall, vigorous, and commanding. Powerful physically, and in every way a strong specimen of manhood, he yet in his manner and presence showed the gentleness of a woman. His intimates were few, but with them he was a genial comrade, as he was also a delightful companion in his household. The union in him of strength and sensitiveness has been well described by James Russell Lowell:

> Far be from sympathetic soul he kept apart
> Beneath a veil, over-fragrance of heart
> Nor [illegible] soul reserved and deep
> [illegible] with a [illegible] of May

The best extant portraits of Hawthorne are the photographs taken by Mayall of London in May 1860. One of these was engraved in *Harpers' Magazine* for July 1886; another in the *Century Magazine* for May 1887.

A preliminary version of the unfinished romance was edited by his daughter Una, his eldest child, with the aid of Robert Browning, and was published under the title of *Septimius Felton* (1872). Another version, edited by his son Julian, appeared as *Dr Grimshawe's Secret* (1883). Both these forms had been abandoned by the author, who left us, MS. portions of the work as he meant to complete it, *The Dolliver Romance* (1876). His widow (who died in London, February 26, 1871) edited and published his *American Notebooks* (1868), *English Notebooks* (1870), and *French and Italian Note-books* (1871); besides bringing out a volume of her own *Notes in England and Italy* (1868). George Parsons Lathrop, who married Hawthorne's younger daughter Rose, published *A Study of Hawthorne* (1876), containing many biographical details, and edited the Riverside edition of the complete works, with notes and a sketch of the author's life (11 vols. 1883). Rose, the second daughter and youngest child (born in 1851, married 1871), has also made numerous contributions to periodicals in prose and verse, and published in 1888 a volume of poems entitled *Along the Shore*. Una, the eldest child, born in 1844, died in London in 1877. Julian Hawthorne issued a complete memoir of his father, *Nathaniel Hawthorne and his Wife* (2 vols. 1885). Henry James, junior, published a brilliant but unsympathetic monograph on Hawthorne (1879); James Russell Lowell a short life (1890); and Moncure Conway one in 1890. See also the *Personal Recollections* of Horatio Bridge (1893).

JULIAN HAWTHORNE, his son, was born at Boston, Massachusetts, June 22, 1846. After his studies at Harvard he devoted himself to engineering at Dresden; next worked under General M'Clellan in the New York Docks, returning to Dresden to pursue a life of letters, continued later in London (1875–82) and in New York. He subsequently settled on a Jamaica farm. His first novels, *Bressant* (1873) and *Idolatry* (1874), were well followed by *Garth* (1875), *Sebastian Strome* (1880), *Fortune's Fool* (1883), and *Dust* (1884); and, not so well, by an innumerable series of shorter stories, some—not over good—of the detective class, such as *David Poindexter's Disappearance* (1888) and *Section 558: or The Fatal Letter* (1888).

Hay (from the same root as *hew*, *hoe*), the stems and leaves of grasses or other plants dried for Fodder (q.v.) of cattle. Throughout the grazing and dairy districts of Ireland and England a large breadth of old pasture is annually cut. In Scotland, however, little of this old natural grass is converted into hay, and the crop consists mainly of clover and sown grasses in which ryegrass bulks largely. This requires less turning and labour than the closer succulent natural grasses, and with twice turning, and a week or ten days' drying, will generally be fit for the rick, into which the English farmer at once places it. In Scotland the weather is seldom sufficiently fine to fit the hay, within a moderate time, for a large rick, and the practice here, as in the moister parts of England and in Ireland, is to put it, after a few days, into *cocks*, containing one or two hundredweight, and thence, after another week, into what are technically called tramp-ricks, containing from one to two tons. From these it is transferred at any convenient time to the rick-yard. This practice, although very prevalent in the north, is attended with loss of time and labour, and, moreover, bleaches and dries up the hay, giving it the appearance of straw, and preventing that gentle heating which English farmers desire both in their clover and grass hay. In the United States timothy is the best haymaking grass; next come redtop, orchard-grass, and blue-grass or June-grass.

The management of the natural grasses of which most English hay consists is somewhat different, and the process is seen in perfection in Middlesex and various of the counties about London. The great matter—too generally overlooked in Scotland—is to preserve the colour and flavour of the grass. This may be done by frequent turning, so as to have it rapidly dried, and if possible without the deteriorating washing of repeated rains. Artificial drying best attains this end, but is of course impracticable on the large scale. In the best style of English haymaking the grass, after being cut with the scythe or machine, and as soon as the dew is off, is shaken and spread out by means of forks or of a *tedding*-machine drawn by a horse.

it is not allowed to lie long exposed to the sun, but before evening is drawn together by rakes into *wind-rows*, which, if there is any prospect of rain, are made up into small heaps or cocks. It is again spread out next morning, or on the return of favourable weather; and when the operations are expedited by wind and sun, the hay will be ready for the rick by the second or third day. There is, however, much difference in the time during which the hay requires to lie out; the bulk of the crop and the quality of the land must be especially considered. When the grasses are cut in bloom, as they should be, and before their seed ripens and their stems get tough and hard, they contain the largest amount of moisture, and require careful making, but produce then the most nutritive and palatable hay. As soon as it is thoroughly dry it should be put at once into the stack or rick, and well trodden down. A certain amount of heating improves the flavour, and renders the hay more palatable to every kind of stock. When, as is sometimes the case, it is imperfectly made, or picked up too soon, it gets overheated, and becomes dark brown or black, while its nutritive properties are diminished; it is, moreover, apt to disagree with both horses and cattle, and can be profitably used only when mixed with straw and cut into chaff. Indeed it has been proved by experiments that hay may be so damaged by bad weather in the process of making as to be unable to maintain, not to speak of increasing, the condition of animals fed upon it. Hay put together when damp from rain or dew does not heat, as it does when it contains an undue amount of natural moisture, but speedily moulds. When hay has been weathered and injured by repeated rains, it may be rendered more palatable by scattering a little common salt or specially prepared spice over the rick whilst it is being built. In Scotland, eight or ten pounds of salt to the ton is used alike for the clover and grass hay. In mid and southern England the best hay is generally got up in June, in Scotland not until the middle of July. The crop averages from one to two tons per acre. Hay that has stood for seed is tougher and less nutritive than that cut earlier, for the sugar, gum, and gluten of the matured seed have been abstracted from the stems. See also SILAGE.

Hay, JOHN, an American author, was born at Salem, Indiana, 8th October 1838, graduated at Brown University in 1858, and was admitted to the Illinois bar in 1861. Almost immediately after he became assistant private secretary to President Lincoln; and during the war he served for some months in the field, retiring with the brevet of colonel. He was afterwards first secretary of legation at Paris (1865–67) and Madrid (1868–70), and *chargé d'affaires* at Vienna (1867–68); and in 1870–75 he was on the staff of the *New York Tribune*. In 1879–81 he was first assistant-secretary of state. His *Pike County Ballads* (1871) include 'Little Breeches' and 'Jim Bludso;' he has also published *Castilian Days*, and, with J. G. Nicolay, a Life of Lincoln (1891). In 1897 he was United States ambassador to Britain, from 1898 secretary of state to President McKinley.

Hayden, FERDINAND VANDEVEER, LL.D., geologist, was born at Westfield, Massachusetts, 7th September 1829, studied at the Albany medical college, and during the greater part of 1853–62 was employed in surveys in the north-west. He served as surgeon in the Union army during the war, and filled the chair of Mineralogy and Geology in the University of Pennsylvania from 1865 to 1872. In 1867–69 he carried out the geological survey of Nebraska, and afterwards was director of the geological survey of the territories of the United States, until in 1879 the various national surveys were combined in the geological survey of the United States. Till 1886 Dr Hayden remained at the head of the Montana division. He died 18th January 1888. He published many papers, besides numerous and valuable government reports.

Haydn, JOSEPH, a German composer, was born at the village of Rohrau, on the confines of Hungary and Austria, 1st April 1732. He was the son of a poor wheelwright; and manifesting great musical talent, he was received at the age of eight into the choir of the cathedral of St Stephen's, at Vienna. Here he remained till his eighteenth year, acquiring a practical rather than a theoretical knowledge of his art, by singing the music of the best Italian and German religious composers. In that year, however, his voice broke, and he lost his place as a chorister. He wandered about the streets of Vienna, and earned a precarious livelihood by playing the violin in serenading parties and at dances. A charitable singer offered him a lodging, which for a short while he availed himself of. Ultimately, by the exercise of great thrift, he was enabled to hire an attic and a piano; then he devoted all his leisure time to study. He bought by accident the six sonatas of C. P. E. Bach at a cheap bookstall, and the indefatigable study of them revealed to him the possibility of new form in music—form which should be the reaction against the old contrapuntal style of J. S. Bach and Handel, and which it became thenceforward his mission to inaugurate. The main essentials of this reaction were the abandonment of the fugue form as the basis of musical composition, and the substitution in its room of two free melodies as themes for treatment, not necessarily constructed in double counterpoint to one another. During this period of assiduous study Haydn still kept up his connection with the serenaders and dance-players of Vienna, for whom he often now wrote the music. One evening as he was playing a serenade of his composition, along with other instrumentalists, under the window of Frau Kurz, the wife of the theatrical manager of that name, her husband was very much struck by the music, and calling Haydn up, commissioned him to write an opera as melodious as the serenade. This was the beginning of his fortunes. His opera made him acquainted with the poet Metastasio, at that time a tutor in Vienna, by whom he was introduced to the composer Porpora, and enabled to remedy the deficiencies of an education principally obtained hitherto through private study.

In the later part of 1759 he composed his first quartet for stringed instruments. In 1759 Count Morzin engaged him as capellmeister. For Count Morzin's orchestra Haydn wrote his First Symphony in D. The once obscure musician was now a popular music-master in Vienna. He married at this time Maria Anna Keller, the daughter of a wig-maker, who had been kind to him in his days of penury. This union did not prove a happy one. The circumstances of it were singular; he had designed to marry the younger sister, but she had determined to retire into a convent, and Haydn was persuaded by the father to take the elder one instead, for whom he had always entertained an objection. 'It is nothing to her,' said Haydn near the close of his life, 'whether her husband be a cobbler or an artist.' Her sole ambition was to squander Haydn's earnings. In 1760 Prince Esterhazy offered him the post of vice-capellmeister. His duties in this new situation were to conduct two operas a week, for which he sometimes had to compose the music, to conduct and compose for an orchestral concert every afternoon, to have a fresh composition for the prince's 'reception' every morning, besides supplying the music for incidental

water parties, dances, &c. Many of Haydn's most beautiful symphonies were written here, and the greater number of his magnificent quartets. The excessive demands on his invention do not seem to have impaired its fertility in the slightest. After the death of Prince Esterhazy in 1790 Haydn accompanied Salomon the violinist to England, where, in 1791-92, he produced six of his *Twelve Grand Symphonies*. His reception was brilliant in the highest degree. On his return to Vienna he had Beethoven for a pupil. In 1794 he made a second engagement with Salomon for England, and during this period brought out the remaining six symphonies. In England he first obtained that recognition which afterwards fell to his share in his own country. On his return to Austria he purchased a small house with a garden in one of the suburbs of Vienna. Here he composed his oratorios the *Creation* and the *Seasons*. The former work, the harmonies of which are pervaded with the fire of youth, was written in his sixty fifth year; the *Seasons* (completed in eleven months) was almost his last work. He died at Vienna, 31st May 1809.

In person Haydn was below the middle stature. His features were regular, and the general cast of his countenance a stern one. He had the peculiarity of never laughing aloud. He was very neat and methodical in his habits—composing a certain number of hours daily, and wearing full court dress when so engaged. His musical style is marked by the predominance of melody—melody in its tenderness, melody in its power, melody incessant. His works have therefore more spontaneousness and charm than the older school of Bach and Handel, but less massiveness, sublimity, and majesty. He clearly realised and pursued his aim, laying down the principle that 'melody is the charm of music, and the invention of a fine air is a work of genius.' He is the father of the symphony, and conduced more than any other man to that separation of instrumental music from vocal, unknown or little practised before his day, which has given an independent life to instrumental music up to the present time.

Haydn's works are exceedingly numerous, comprising 125 symphonies, 83 quartets, 38 trios, 14 operas, 8 oratorios, 175 pieces for the baritone, 24 concertos for different instruments, 14 masses, 1 Stabat Mater, 10 smaller church pieces, 44 sonatas for the pianoforte, with and without accompaniments; 12 German and Italian songs, 39 canzonets, 13 hymns in three and four parts, the harmony and accompaniment to 364 old Scottish songs, besides a prodigious number of divertissements and pieces for various instruments.

Compare Carpani's *Le Haydine* (2d ed. Padua, 1823); Haydn's autobiographical sketch, first published in the *Wiener Zeitschrift für Kunst* (1836); Karajan's *Joseph Haydn in London* (Vienna, 1861); Pohl, *Joseph Haydn* (3 vols. 1875-90); Miss Townsend's *Life of Haydn* (Lond. 1884).

Haydon, Benjamin Robert, historical painter, whose biography forms one of the saddest pages in the record of British art, was born at Plymouth on 25th January 1786. He attended the grammar-school of Plympton, where Sir Joshua Reynolds had been educated; and his father, a bookseller, being desirous that his son should follow his own trade, placed him in his shop. But, in spite of delicate eyesight, the boy was resolved to become a painter, and in May 1804 he was admitted a student of the Royal Academy, where he was befriended and influenced by Fuseli, the keeper. Three years later he exhibited his first picture, 'Joseph and Mary resting on the Road to Egypt,' and after studying assiduously for three months the Elgin marbles, whose purchase by the nation he afterwards enthusiastically advocated, he produced his 'Dentatus,' a commission from Lord Mulgrave. The work was coldly received by the Academy in 1809, and hung in the anteroom; and this treatment was the beginning of the painter's rupture with that body, which embittered his life and damaged his prospects. In the following year he began a large subject from *Macbeth*, which had been commissioned by Sir George Beaumont, but was afterwards declined. He was more successful with his 'Judgment of Solomon,' probably his finest production, now in the collection of Lord Ashburton, which he sold for 700 guineas. It gained a prize of 100 guineas from the Royal Institution, which had awarded a like sum for the 'Dentatus.' Having visited the Continent with Wilkie in 1814, and studied the old masters in the Louvre, Haydon began his 'Christ's Entry into Jerusalem,' which was completed in 1820, and realised £1700 by exhibition in the Egyptian Hall, London. It is now in the art-gallery of Philadelphia. Another immense religious subject, 'The Raising of Lazarus,' was completed in 1823, in the midst of great difficulties. The artist had been arrested for debt during its progress, and during the rest of his life he was never able to free himself from financial embarrassments, though it was proved that during six years, from 1831 to 1836, he had earned £4617 by his art. His 'Mock Election,' purchased by George IV. for 500 guineas, was founded upon a scene witnessed by the painter while a prisoner in King's Bench. He resorted to every kind of expedient to meet the needs of the moment. Greatly against his will he took to portrait-painting; a public subscription was raised on his behalf; he raffled his 'Eucles' and 'Xenophon's First Sight of the Sea;' he delivered a popular series of lectures on painting and design in 1836, published in two volumes in 1844. In 1832 Lord Gray commissioned the well-known picture of 'The Reform Banquet,' and in 1834 the Duke of Sutherland gave 400 guineas for a 'Cassandra.' Haydon had never wearied of urging upon government and persons of influence the necessity for the national encouragement of art, and it was a bitter disappointment when he failed to obtain employment by the commissioners for the decoration of the Houses of Parliament. He was further crushed by the entire want of success which attended his exhibition of two completed pictures from the designs which he had prepared for the cartoon competition; his mind gave way, and on 20th June 1846 he shot himself in his studio before his unfinished painting of 'Alfred's First Parliament.' The works of Haydon are elevated in aim and subject, and Mr G. F. Watts, R.A., has pronounced that 'his expression of anatomy and general perception of form are the best by far that can be found in the English school, and I feel even a direction towards something that is only to be found in Phidias.' His works, however, are very unequal in their several parts; his execution was seldom equal throughout to his conception; and most of his productions bear only too evident traces of the haste and the untoward circumstances amid which they were executed. See the *Life of Haydon, from his Autobiography and Journals*, edited by Tom Taylor (3 vols. 1853); and his *Correspondence and Table Talk*, with a Memoir by his son (1876).

Haye, La. See Hague.

Hayes, Augustus Allen, chemist, was born at Windsor, Vermont, in 1806, studied chemistry under Professor Dana, and settled in Boston in 1828. He discovered the organic alkaloid sanguinaria, carried through experiments which led to the construction in 1838 of improved furnaces and boilers, suggested the process of reducing pig to

malleable iron without loss by the use of the oxides of iron, as well as new processes in copper-smelting, the decomposition of alcohol, and the formation of chloroform, and made important investigations into the properties of guano. He also examined the constitution of sea-water and fresh water at various depths, prepared a report for the navy department on the copper-sheathing of vessels, and supplied a novel process for the manufacture of saltpetre. Hayes was for many years state assayer of Massachusetts, and died in Brookline there, 21st June 1882.

Hayes, Isaac Israel, Arctic explorer, was born in Chester county, Pennsylvania, 5th March 1832, graduated in medicine at the University of Pennsylvania in 1853, and sailed as surgeon in the Kane expedition in search of Franklin. The story of his attempt to reach Upernivik in 1854 is told in *An Arctic Boat-journey* (1860). In 1860–61 he conducted a second expedition to the Arctic regions; and in 1869 he again visited Greenland. His third voyage is described in *The Land of Desolation* (1871). He was surgeon of volunteers from 1862 to 1865, retiring with the brevet rank of lieutenant-colonel; and he served in the New York assembly for five years. His Arctic work was recognised by medals from the London and Paris geographical societies. He died 17th December 1881.

Hayes, Rutherford Birchard, nineteenth president of the United States, was born at Delaware, Ohio, 4th October 1822. He graduated at Kenyon College, Ohio, in 1842; and, having studied law at Harvard, he practised as a lawyer at Cincinnati, 1849–61. In the civil war Hayes served with distinction as an officer of volunteers, being once severely wounded, and ultimately attained the rank of brevet major-general. He was returned to congress from Ohio in 1865 and 1866, chosen governor of his state in 1867, and re-elected in 1869 and again in 1875. In 1876 he was selected as the Republican candidate for the presidency of the United States, the Democratic candidate being Samuel J. Tilden (q.v.). The election which followed was notable for the exciting complications and the period of tension and suspicion that ensued. In Louisiana two electoral boards were commissioned by rival claimants to the governorship, and in some of the other states questions arose touching the legality of the return of the Republican presidential electors. Finally, an electoral commission was created by act of congress, consisting of five judges of the supreme court, five senators, and five representatives. This body, made up of eight Republicans and seven Democrats, gave the disputed votes to Hayes, by a majority of eight to seven. The electoral vote was thus returned at 185 for Hayes against 184 for Tilden; the popular vote, as counted, stood 4,284,265 for Tilden and 4,033,295 for Hayes. This decision was generally acquiesced in, although the conviction of the Democratic party that their candidate had been unjustly deprived of office remained unshaken; and as late as 1878 the Democratic majority of a congressional committee of investigation issued a report declaring the action of the returning boards in Louisiana and Florida to have been fraudulent. Under the Hayes administration the country recovered much of its commercial prosperity, which had suffered severely in the financial crash of 1873. Two features in Hayes's policy were reform of the civil service (in pursuance of which he removed from the collectorship of customs at New York Chester Alan Arthur, q.v.) and the conciliation of the southern states. He was also active in pressing forward the resumption of specie payments; but the bill for the monetisation of silver was carried against his veto. He died at Fremont, Ohio, 16th January 1893. See Life by Stoddard (1889).

Hayesine, also called Borate of Lime and Ulexite, is a double salt of sodium and calcium, and a source of Boracic Acid (q.v.).

Hay-fever, also called Hay-asthma and Summer-catarrh, a disease mostly met with in early summer, has as symptoms those of a common catarrh—viz. redness and swelling of the nasal mucous membrane, with a copious watery discharge and repeated paroxysms of sneezing, irritation of the eyes, and intense headache. There are also present general malaise, loss of appetite, and more or less feverishness; and difficulty of breathing is added when the bronchial mucous membrane is affected. Hay-fever is most commonly a disease of adult life, but it may occur at all ages. It usually returns annually when the patient is subjected to the exciting cause, which is oftenest in the form of floating pollen of different grasses, although other things such as dust or bright sunlight may set up an attack. Three factors essential to the production of hay-fever are a nervous constitution or idiosyncrasy, a local irritability, and an external exciting cause. The treatment to be successful must be directed to these: (1) improve the health by quinine, arsenic, or other tonics, and soothe the nervous state by bromide of potassium or antipyrin; (2) act locally by pungent inhalations, as iodine, or by the thermo-cautery; (3) finally remove the patient from the cause by sending him to the seaside or for a voyage. See *Hay Fever*, by Sir Morell Mackenzie (4th ed. 1887).

Hayley, William, Cowper's biographer, was born at Chichester, 9th November 1745, but abandoned legal studies for a life of lettered leisure, living in London, at Eartham in Sussex, and lastly at Feltham, where he died 20th November 1820. Among his works are didactic *Essays* in verse on painting, on history, on epic poetry, *The Triumphs of Temper: a Poem*, some plays, a Life of Milton, a Life of Romney, and his most memorable monument, *The Life of Cowper* (1803; see Cowper). *Memoirs* of and by himself were published in 1823.

Haym, Rudolf, philosopher and writer, was born at Grünberg in Silesia on 5th October 1821. In 1848 he sat in the national assembly at Frankfort; but in 1851 he began to lecture on philosophy and German literature at Halle, and was eventually appointed professor there in 1868. He has written biographies of Wilhelm von Humboldt (1856), Hegel (1857), Schopenhauer (1864), and Herder (1877–85), as well as a useful monograph, *Die Romantische Schule* (1870).

Haynau, Julius Jakob, Baron von, an Austrian general, was born at Cassel, in Germany, 14th October 1786. Entering the Austrian service in 1801, he signalised himself during the Italian campaigns of 1848–49 by his ruthless severity, especially at the capture of Brescia, where his flogging of women and other atrocities gained him the name of the 'Hyæna of Brescia.' Haynau was engaged in the siege of Venice, when he was summoned by the emperor to Hungary, in May 1849, to take the supreme command of the forces in that country. The storming of Raab, his victory at Komorn, his occupation of Szegedin, and his victories on the Theiss contributed materially to the final success of the imperialists. But Haynau's atrocious severity towards the defeated Hungarians excited the detestation of Europe. Although appointed dictator of Hungary after its pacification, he was nevertheless dismissed in 1850 on account of the intractability of his character. In the same year, when visiting the

brewery of Messrs Barclay & Perkins, in London, he was assaulted by the draymen, on account of his cruelty, and escaped with his life, but the loss of his moustache. Baron Schonhals, in a biography of his friend Haynau (Gratz, 1853), tries to exonerate his character, and asserts that he only acted in obedience to the orders of his masters. Haynau died at Vienna, March 14, 1853.

Hayne, Robert Young, an American statesman, born in South Carolina in 1791, was admitted to the bar in 1812, served in the war with Great Britain, and at its close returned to his practice in Charleston. He was a member of the state legislature in 1814-18, and became speaker, was attorney-general of the state in 1818-22, and sat in the United States senate from 1823 to 1832. He was a vigorous opponent of protection, and in 1832 boldly supported in congress the doctrine of Nullification (q.v.). Daniel Webster's reply ranks among his ablest speeches. In November 1832 South Carolina adopted an ordinance of nullification, in December Hayne was elected governor, and the state prepared to resist the federal power by force of arms. A compromise, however, was agreed to (see Jackson), and the ordinance was repealed. Hayne died 24th September 1839.

Hay River, a feeder of Great Slave Lake in the Canadian North-west. In its course, north-east to the southern shore of the lake, it descends the two Alexandra Falls, about 250 feet high and 300 yards wide.

Hayti, or Haïti ('mountainous country,' otherwise Hispaniola, or Santo Domingo), is, after Cuba, the largest of the West Indian Islands, now divided into the independent states of Hayti and the Dominican Republic (q.v.). For the map, see West Indies. It is nearly equidistant from Porto Rico on the E., and from Cuba and Jamaica on the W., with the Caribbean Sea on the S., and with the Bahamas and the open ocean on the N. Hayti lies between 17° 37' and 20° N. lat., and between 68° 20' and 74° 28' W. long. It belongs to the group of the Greater Antilles, and, like all the principal members of its series, its greatest length (about 400 miles) is in the direction from west to east of the chain of which it forms a part; its greatest breadth is 160 miles. Area, including the islands of Tortuga, Gonaive, &c., about 28,820 sq. m., or nearly that of Scotland. The country is mountainous, being traversed longitudinally by northern, central, and southern ridges, terminating in headlands on either coast; but between these ranges are wide and fertile plains. There are no active volcanoes in the island, but earthquakes are frequent. The highest peak is Loma Tina (10,300 feet), and in the middle section of the Sierra del Cibao the average height is 7000 feet. The climate is hot and moist in the lowlands, the temperature at Port-au-Prince ranging from 67° to 104° F.; the mean range in the highlands is from 60° to 76° F. The heaviest rains are in May and June, and occasional hurricanes visit the island. Agriculture is very backward, although Hayti is one of the most fertile spots in the West Indies; while its excellent harbours, more especially those in the Gulf of Gonaive on the west, offer considerable facilities to foreign trade. The mountains are clothed with forests of pine and oak, and the island is rich in mahogany, satinwood, rosewood, and other valuable timbers. Cotton, rice, maize, cocoa, ginger, arrow-root, yams, tobacco, and numerous fruits are indigenous; and the mango, bread fruit, sugar, coffee, and indigo are also produced. The minerals are now little worked, though some gold-washing is still carried on in the streams descending the northern slope of the Cibao. The rivers are inconsiderable, and useless for navigation. The largest lake, besides several bodies of fresh water, is the salt lake of Enriquillo, 25 miles inland from the south shore. Both rivers and lakes abound in caymans as well as fish. Birds are few, but reptiles and insects are numerous; the agouti is the largest wild mammal.

Hayti was discovered in 1492 by Columbus, who landed here on 6th December; and within little more than one generation the aborigines had been swept away by the remorseless cruelties of the Spaniards. Their place was filled with negro slaves, who were introduced as early as 1505. Next came the Buccaneers (q.v.), who settled in the island of Tortuga, and ultimately gained a footing on the mainland; and, as those marauders were chiefly French, the western portion of Hayti, which was their favourite haunt, was in 1697 ceded to France by the peace of Ryswick, thus presenting the first important break in the unity of Spanish America. For nearly a hundred years the intruders imported vast reinforcements of Africans; while the mulattoes, who were a natural incident of the concomitant license, rapidly grew, both socially and politically, into an intermediate caste, being at once uniformly excluded from citizenship and generally exempted from bondage. In 1791, under the influence of the French Revolution, the mutual antipathies of the three classes—white, black, and mixed—burst forth into what may well be characterised as the most vindictive struggle on record—a struggle which, before the close of the 18th century, led to the extermination of the once dominant Europeans, and the independence of the coloured insurgents. Thus, as the emancipated bondmen mostly belonged, at least in form, to the Church of Rome, Hayti now exhibited the only Christian community of negro blood on either side of the Atlantic. In 1801 France sent out a powerful armament to recover her revolted dependency, treacherously seizing and deporting the deliverer of his brethren, Toussaint l'Ouverture (q.v.). In 1803, however, she was constrained to relinquish her attempt; and in 1804 Dessalines, aping the example of Napoleon, proclaimed himself Emperor of Hayti, thus reviving the indigenous name of the island, which had been in disuse for upwards of three hundred years.

This great change was fatal to the commercial prosperity of French Hayti, decidedly the more valuable section of the island. In its progress it had destroyed capital in every shape; and in its issue it could not fail to paralyse labour under circumstances where continuous exertion of any kind was equally irksome and superfluous. Nor was the political experience of the lately servile population more satisfactory than its economical condition. Sometimes consolidated into one state, and sometimes divided into two, the country alternated, through the instrumentality of one revolution after another, between despotism and anarchy, between monarchy (more or less constitutional or imperial) and republicanism. Its only tranquil period of any duration coincided with the rule of President Boyer (q.v.), which subsisted from 1820 to 1843—its last twenty one years comprising not merely the whole of French or Western Hayti, but likewise the Spanish or eastern portion of the island, whose inhabitants in 1843 formed themselves into the Dominican Republic (q.v.). Hayti, thus united, was in 1825 recognised even by France, on condition of paying 150 million francs, or £6,000,000, as a compensation to the former planters—a sum reduced in 1838 to sixty millions. The western portion of the island remained republican in its form of government until 1849, when its former president, the negro General Soulouque, proclaimed an empire, and assumed the title of Emperor Faustin I. In 1859, however, a republic was again proclaimed and a new constitution adopted, which was modified in 1867. Few

presidents have since been permitted to complete their term of office (seven years), which has usually been cut short by revolutions. In 1889 General Hippolyte succeeded in the chief-magistracy General Legitime, whom he had driven out of the country. Sir Spenser St John's *Hayti, or the Black Republic*, gives a truthful picture, at once melancholy and ludicrous, of the utter savagery that is dominant in the western state. Official peculation, judicial murder, and utter corruption of every kind underlie the forms and titles of civilised government; the religion, nominally Christian, is largely *vaudoux* or serpent-worship, in which actual and horrible *cannibalism* is even now a most important element. Instead of progressing, the negro republicans have gone back to the lowest type of African barbarism.

The area of the western portion of the island, the negro republic of Hayti, is about 9200 sq. m.; the population was stated in 1888, somewhat extravagantly, at 960,000; it is probably under 600,000. The capital, Port-au-Prince, is reported to have 30,000 inhabitants, and perhaps has 20,000. Under the president are a senate and house of representatives, and four heads of departments. The returns of income and expenditure are merely estimates, and the disorders of civil war have in recent years rendered these more than usually valueless. There is a large floating debt, chiefly resulting from the issue of paper money by successive governments. The total debt amounts to between £3,000,000 and £4,000,000. The annual revenue is, since 1894, stated at £1,250,000, a sum generally exceeded by the expenditure. The army consists nominally of 6828 men, mostly infantry; some half-dozen small vessels constitute the navy. The dialect of the people is a debased French. The exports of Hayti may have a value of about £1,000,000 a year; the chief articles are coffee, cacao, logwood, mahogany, and cotton. Of the imports, valued at about £700,000 annually, over two-thirds come from the United States, the rest mainly from Germany, France, and Britain.

See St John, *Hayti, or the Black Republic* (1884; 2d ed. 1889); works by Maidou (1847), Ardouin (Paris, 1853-61), Linslant-Pradine (Paris, 1851-65), Janvier (Paris, 1883-85, 86), La Selve (1876-81), Nau (Paris, 1886), Fortunat (1888), Rouzier (1892), Marcelin (1893), Justin (1894), and Tippenhauer (Leipz. 1893).

Hayward, ABRAHAM, essayist and talker, was born at Wishford, in Wiltshire, 31st October 1802. He had neither public school nor university education, but after keeping terms at the Inner Temple was called to the bar in 1832. His leanings were, however, more to letters than to law, yet he founded and edited the *Law Magazine*, and to every one's surprise was made Q.C. by Lord Lyndhurst in 1845. He published in 1833 his excellent prose translation of the first part of *Faust*, and soon became a busy contributor to the newspapers and magazines, especially the *Quarterly Review*, in which readers soon learned to recognise his personality in an unusual combination of vivacity, epigrammatic verve, and critical acumen. By his brilliant conversation, his wealth of anecdotes, his whist-playing, and his artistic interest in 'the art of dining' he delighted society almost down to his death, at London, February 2, 1884. Many of his best articles were reprinted in his *Biographical and Critical Essays* (2 vols. 1858), the second series (2 vols. 1873), and the third (1 vol. 1873); and in *Sketches of Eminent Statesmen and Writers* (2 vols. 1880). Other books were *Autobiography and Remains of Mrs Piozzi* (2 vols. 1861), *Selections from the Diary of a Lady of Quality* Sir Watkin Wynne's daughter (1864), and a somewhat perfunctory book on *Goethe*, in 'Foreign Classics for English Readers' (1877). His little books *The Art of Dining* (1852), *Lord Chesterfield* and *George Selwyn* (both in 1856), and *Short Rules of Modern Whist* (1878)—were widely circulated. In 1878 he published in two volumes his *Selected Essays*. His *Select Correspondence* was given to the world in two volumes in 1886.

Hazard, a game with two dice. The *caster* calls 5, 6, 7, 8, or 9 for the *main*. He then throws. If he throws the number called, or if he throws 12 when 6 or 8 is the main, or 11 when 7 is the main, he *nicks*, and wins of his opponent (named the *setter*). If he throws 2, 3, 11, or 12 when 5 or 9 is the main, or 2, 3, or 11 when 6 or 8 is the main, or 2, 3, or 12 when 7 is the main, he loses. If he throws any other number—thus, when 7 is the main, if he throws 4, 5, 6, 8, 9, or 10—it is called his *chance*. He then continues to throw until either the main or the chance is thrown. If the main is first thrown, the setter wins; if the chance is first thrown, the caster wins.

Hazaribagh, chief town of the district of the same name in the division of Chota Nagpore, Bengal. It is really a cluster of hamlets, which sprung up round the former military bazaar, with tilled fields between; the European troops have now for some years been withdrawn. Pop. 15,306. —Hazaribagh *district* has an area of 7021 sq. m., and a population of a million and a quarter.

Hazebrouck, a town in the French department of Nord, 28 miles WNW. of Lille by rail. The parish church (1493–1520) is surmounted by a spire of open work, 260 feet high. There are some linen and tobacco manufactures. Pop. 7680.

Hazel (*Corylus*), a genus of trees of the natural order Cupuliferæ, of which the fruit is a nut in a leafy and laciniated cup, the enlarged involucre of the female flower. The male flowers are in cylindrical catkins; the female flowers appear as mere clusters of coloured styles at the extremities of buds. The Common Hazel (*C. Avellana*) is a low

Common Hazel (*Corylus Avellana*): *a*, male and *b*, female flowers; *c*, fruit.

tree, a native of Britain, and of all the temperate parts of Europe and Asia; it is common also in North America. There are ten or twelve improved varieties cultivated extensively in Kent, especially around Maidstone and in some other parts of England. Of these there are two types—one with round nuts, named *cobs*; the other with elongated nuts, named *filberts*. The cup or involucre of the former is shorter, more open, and not so much lacerated as that of the latter. Of either type there is a variety in which the pellicle enclosing the kernel

is deep red; and both of these are highly esteemed. These particular varieties are propagated by suckers which are more or less freely produced, by layers, and by budding and grafting. The tree is extensively grown in some parts of England for coppice-wood, being reared for this purpose from seed. The young straight stems and branches are employed for making crates, baskets, hurdles, hoops, stakes, &c.; and the larger wood for charcoal, which is in great request for forges, for the manufacture of gunpowder and artists' crayons. Chips of the wood are in Italy sometimes put in turbid wine for the purpose of fining it; and the roots are used by cabinet makers for veneering. Magical properties have been ascribed to hazel-rods by the credulous, as it was of them the *Dowsing rod* (q.v.) was formed for the purpose of discovering water, minerals, or buried treasure. From the wood an empyreumatic oil is extracted, which is a vermifuge, and alleged to be a cure for toothache. Hazel-nuts yield, on pressure, about half their weight of a bland fixed oil, often called *nut oil* in Britain, the hazel nut being popularly known by the term *nut* alone; but in Germany it is walnut oil which is usually called nut oil. Hazel-nut oil has drying properties, and is much used by painters; it is also used by perfumers as a basis with which to mix expensive fragrant oils; and it has been employed medicinally in coughs.

The larva of a weevil (*Balaninus nucum*) feeds on the kernels of hazel-nuts. The parent female makes a hole into the nut by means of her long snout, and there deposits an egg. Great numbers of nuts are thus destroyed.

The Beaked Hazel (*C. rostrata*), a species having a very hairy fruit-cup prolonged into a long beak, is a native of the northern parts of America. Its kernel is sweet.—The Constantinople Hazel (*C. colurna*), the nuts of which are considerably larger than those of the common hazel, is a native of the Levant, from which the fruit is imported into Britain. It is much used for expressing oil, but is a less pleasant fruit than many kinds of cob-nut and filbert. A Himalayan species of hazel (*C. ferox*) has a spiny fruit-cup, and an excessively hard nut. *Barcelona nuts* are the nuts of a variety of the common hazel, kiln-dried before their exportation from Spain. Hazel-nuts not subjected to this process cannot be kept long without losing in part their agreeable flavour, and contracting a sensible rancidity, except in air-tight vessels, in which they are said to remain fresh even for years.

Hazleton, a borough of Pennsylvania, 80 miles NNW. of Philadelphia, has ironworks, lumber-mills, and railway-car shops, but is of importance mainly as the chief business centre of the rich Lehigh coalfield. Pop. 7161.

Hazlitt, William, was born at Maidstone on April 10, 1778. His father was a Unitarian clergyman who belonged to the county of Antrim. In his fifteenth year he began to study in the Unitarian College at Hackney, with the view of becoming a dissenting minister, a design which he early abandoned. In 1798 he formed the acquaintance of Coleridge, who encouraged him to compose his *Essay on the Principles of Human Action* ('the only thing,' he said, 'which I ever piqued myself upon writing'), which was not published, however, until 1805. For some time he endeavoured to earn a living as a portrait-painter; and, according to Northcote, would have become a great artist had he not forsaken his easel for his desk. In 1806 he published his *Free Thoughts on Public Affairs*, and in 1807 his *Reply to the Essay on Population by the Rev. T. R. Malthus*. After his marriage with Miss Stoddart in 1808 he lived at the village of Winterslow, in Wiltshire, until 1812, when he removed to York Street, Westminster, and found employment as a writer on the *Morning Chronicle* and *Examiner*. From 1814 to 1830 he contributed to the *Edinburgh Review*. His *Round Table: a Collection of Essays on Literature, Men, and Manners*, and the most popular of his works, his *Characters of Shakespeare's Plays*, appeared in 1817. Between 1818 and 1821 he delivered lectures at the Surrey Institute, which were afterwards published under the titles *Lectures on the English Poets*, on the *English Comic Writers*, and on the *Dramatic Literature of the Age of Elizabeth*. His marriage proved an unhappy one, and, after living for some time apart, Hazlitt and his wife were divorced in 1822. He was fond of retiring to Winterslow Hut, a coaching-house on the high-road from London to Salisbury. At this lonely inn, which stands amid bleak wolds on the verge of Salisbury Plain, he wrote most of the essays which he contributed to the *London Magazine*, and which were afterwards republished in his *Table Talk* (1821) and *Plain Speaker* (1826). An unfortunate passion for the daughter of a tailor with whom he lodged found expression in the *Liber Amoris, or the New Pygmalion* (1823), a book of a strong though painful interest. In 1824 he married a lady of some means, who travelled with him to Italy, but left him, for causes which can only be conjectured, during the return journey, and never joined him again. His *Selections from the English Poets* and *Sketches of the Principal Picture Galleries in England* appeared in 1824; his *Spirit of the Age, or Contemporary Portraits*, which some critics consider the ripest in thought and most felicitous in style of all his works, in 1825; and his *Life of Napoleon Bonaparte* in 1828–30. His last years were darkened by ill-health and money difficulties. He died on September 18, 1830.

Wayward and irascible, a prey to melancholy, and too often the victim of a rash and haughty self-confidence, Hazlitt was at bottom generous, ardent, and sincere. But his defects were sharpened by unsuccess, and above all by the scurrilous malignity with which his character and his writings were traduced by hired libellers of adverse politics. The scope of his powers was never recognised by his contemporaries, though, as Thackeray has said, there were probably not in all England twelve men with powers so varied. His genius had many facets. He excelled in description and in narrative, in reflection and in critical analysis. He wrote of nature and of art and the characters of men; as a critic of the drama he has never been equalled. He was one of the deadliest controversialists, a master of epigram and burning invective and withering irony. His letter to William Gifford stands unsurpassed as an example of polished vituperation. His judgment was at times clouded by prejudice and distorted by his love of paradox. But of all the Georgian critics he was the most eloquent, the most catholic, the most thoroughly equipped. He never wrote in cold blood; he welcomed excellence everywhere. He did justice alike to the Lakers and to the Queen Anne men. He was not less discriminating than enthusiastic. His style ranges from lively gossip to glowing rhapsody; at its best it touches one of the high-water marks of English, it is at once so vigorous and so graceful, so lucid and so rich, so exquisitely apt are the epithets, so firmly built are the sentences, so noble is the rhythm of the periods. His autobiographic essays are perhaps of all his works the most delightful—stamped with the seal of truth, tremulous with pathos, and bathed in the light of poetic imagination. His writings have never gained the recognition they merit; yet, with all his defects, it would be hard to point to Hazlitt's master in all the ranks of English critics.

See G. Saintsbury's article in *Macmillan's Magazine* for 1887; Leslie Stephen's *Hours in a Library* (2d

series, 1877); and Bulwer Lytton's *Quarterly Essays* (1875). A collection of Hazlitt's works in 7 vols.—exclusive of the *Life of Napoleon*—has been edited by his grandson, W. C. Hazlitt, who also wrote Memoirs of him (2 vols. 1867). Alexander Ireland issued an annotated List of his writings (1868), and an admirable selection from his writings, with a brief essay on his life and characteristics as an author (1889).

Head. See BRAIN, CONCUSSION, EAR, EYE, SKULL, TEETH, &c.

Head, SIR EDMUND WALKER, Bart., governor-general of Canada, was the son of the Rev. Sir John Head, and was born in 1805, near Maidstone, Kent. From Winchester he passed to Oriel College, Oxford, where he took a first in classics in 1827, and became a Fellow of Merton; in 1838 he succeeded his father, the seventh baronet. After serving as poor-law commissioner, he became in 1847 lieutenant-governor of New Brunswick, and held this post until September 1854, when he succeeded the Earl of Elgin as governor-general of Canada. He retired in 1861, was made a civil-service commissioner in 1863, and privy-councillor in 1867. He wrote a *Handbook of Spanish Painting*, and other popular books on art, and published *Ballads and other Poems, original and translated* (1868). He died 28th January 1868.

Head, SIR FRANCIS BOND, Bart., author, and governor of Upper Canada, was born at Hermitage, near Rochester, 1st January 1793. He entered the corps of Royal Engineers, served at Waterloo and elsewhere, and had attained the rank of major when he retired from the service. In 1825 he accepted an engagement from a private company to work some gold and silver mines on the river Plate; and his spirited *Rough Notes* of his travels across the pampas and over the Andes gained for him the name of 'Galloping Head.' In 1835 he became governor of Upper Canada, where, at the head of the militia, he succeeded in suppressing an insurrection, which had its origin, as it was said, in his injudicious measures; but this charge he may fairly be held to have refuted in his *Narrative* (1839) of these events. In 1837 he resigned his post, and was created a baronet in 1838. After his retirement he devoted himself to literary pursuits, and for some years enjoyed a pension of £100 'for his services to literature.' His books include *Bubbles from the Brunnen of Nassau*, *A Faggot of French Sticks*, *Stokers and Pokers*, *A Visit to Ireland*, *The Emigrant*, *The Horse and his Rider*, *The Royal Engineer*, and Lives of Bruce, the traveller, and Sir John Burgoyne. He died 20th July 1875.

Headache can scarcely ever be called a disease, but it is a common symptom of many ailments. It is sometimes caused by serious mischief within the cranium, but far more frequently it depends upon an alteration in the quality of the blood, or in a deficient or excessive supply of it to the head. The deterioration in quality may be caused by fevers, by inflammations of various organs—e.g. the kidneys, or even by breathing the air of a crowded room. The congestive form of headache is often produced by mere mechanical obstruction to the return of blood from the head. A tight collar or an awkward position of the neck during rest may cause it. This form of headache is aggravated by stooping. On the other hand the anæmic variety is often relieved by lying down. The neuralgic headache is one of the commonest of all, and is especially associated with the hysterical tendency. Another variety which is on the increase in this hurried and hard-driven generation is that caused by excessive brain-work. Lastly, there is the sick headache, megrim or migraine, which comes on periodically in paroxysms, often associated with bilious vomiting.

The great rule for the treatment of headache is first of all to correct the general morbid condition on which it depends. Without this, local treatment is usually of little avail, and at best is only of temporary benefit. Except in anæmic cases the patient should have the head and shoulders well raised during sleep. Aperients give relief in nearly every form except the neuralgic. If the blood is deteriorated it must be improved by iron, 15 to 20 drops of the tincture of the perchloride, three times a day. Quinine is of use in periodic headaches in doses of 2 or 3 grains, three or four times a day. In neuralgic pain about the forehead menthol rubbed on often gives speedy relief. Gelsemium and Indian hemp are useful internal remedies, but opium is of doubtful value. Bromide of potassium in 30-grain doses may be given with the Indian hemp, if there is much restlessness. Of local applications chloroform and mustard are perhaps the most generally serviceable. In all cases the diet and habits of life should be carefully regulated.

Head Borough, an old term for the head of a borough, or high constable. See CONSTABLE.

Head-hunting. See DYAKS.

Head-money. See POLL-TAX.

Headon Beds. See OLIGOCENE SYSTEM.

Health. See HYGIENE.

Health, BILL OF, in Shipping, is a document carried by every British ship, unless engaged in the coasting trade, or specially exempted. It is granted at home by the customs, and abroad by the British consular agent, or, if there is no such person, by a British merchant or foreign consul. When no contagious or infectious disease is known to exist at the place of departure, the bill is 'clean;' when there is reason to fear the appearance of such disease, the bill is 'suspected;' when such disease actually exists, the bill is 'foul.' The practice of other countries is identical. See QUARANTINE.

Health, BOARD OF. See PRIVY-COUNCIL.

Health-resorts, frequented for combating disease or invigorating the comparatively healthy, fall into several well-marked groups. (1) Sea-bathing quarters have long been in vogue amongst civilised nations, though the periodical exodus from cities is of modern origin. (2) The remedial and invigorating agency of mountain air has been more recently recognised, but is now fully established. Hence the popularity of many inland highland districts in Scotland, Switzerland, and Norway. (3) Curative wells—thermal, muriated, alkaline, sulphated, chalybeate, sulphureous, calcareous—have been frequented from the earliest times, and are found in many countries. The various kinds of water and their beneficial qualities are dealt with in the article MINERAL WATERS. (4) Climatic health-resorts at a high altitude, such as Davos Platz, Andermatt, Meran, &c., have of late come into favour because of their value for persons recovering from acute illness, and who are able to take active outdoor exercise; and specially for those in the early stages of phthisis, or in chronic phthisis unaccompanied by fever or blood-spitting. When there is hæmoptysis, such a climate is disadvantageous or dangerous—as it is also in cases of heart-disease, chronic bronchitis, and chronic rheumatism. (5) Residence for longer or shorter times in exceptionally temperate, mild, or warm climates is recommended for pulmonary diseases, particularly phthisis. Such favoured regions are Bournemouth, Torquay, and other places on the south coast of England and the Isle of Wight, the Riviera (Mentone, Nice, &c.), Hyères, Pozzuoli and other sheltered places in south Italy, Palermo, Madeira, Algiers, and Upper Egypt. Florida, southern California, and the

pine woods of Georgia are in favour with Americans. The climate of Colorado, bracing though not altogether mild, is also beneficial to bronchial and pulmonary weakness. In hot countries the sanitariums are usually cool hill stations—thus, in India, Simla, Darjiling, Naini Tal, Utakamand, Pachmarhi. (6) Climatic resorts where additional help is obtained for special treatment—such as the grape cure in phthisis (Meran), whey cure (Gais in canton Appenzell), and the goat's milk, ewe milk, or cow's milk cure. The influence of the pine woods at Arcachon is supposed to be favourable to consumptive patients. Also such special devices as warm mud baths, or the sun bath cure (exposure of the uncovered person to the sun's heat and light), as practised at Veldes in Carinthia. (7) Hydropathic establishments generally. (8) Sea-voyages may also be here noted, as suitable for persons in the early stages of phthisis, and in cases of nervous exhaustion. See BATH, HYDROPATHY, MINERAL WATERS; the articles on the most notable health resorts; and Charteris, *Health Resorts at Home and Abroad* (1885); J. Burney Yeo, *Climate and Health Resorts* (1885); Upcott Gill's *Dictionary of Watering Places* (1885); and Fraser Rae's *Austrian Health resorts* (1888).

Hearing. See EAR.

Hearne, THOMAS, an eminent English antiquary, was born in 1678 in the parish of White Waltham, Berkshire, and had his education at St Edmund Hall, Oxford, where he graduated B.A. in 1699. Two years later he was appointed to a post in the Bodleian Library, of which in 1712 he became second keeper. This office he was obliged to resign in 1716 from his inability to take the oaths to the government, but he continued to live at Oxford occupied entirely with his studies. He died 10th June 1735. Hearne compiled and edited no less than forty-one works, all stamped by painful and laborious learning, although poor in style and somewhat rambling in method. They are usually marred by the intrusion of irrelevant matter—even his Jacobitism crept into his prefaces; yet they remain solid contributions to bibliography, and their author deserved better than to be gibbeted in the *Dunciad* as a dull and dusty pedant.

His most important books were *Reliquiæ Bodleianæ* (1703), Leland's *Itinerary* (9 vols. 1710-12), Leland's *Collectanea* (6 vols. 1715), *A Collection of Curious Discourses upon English Antiquities* (1720), and the editions of Camden's *Annals* (3 vols. 1717). Adam of Bexley (1716), William of Newburgh (1719), Fordun's *Scotichronicon* (1722), Robert of Gloucester's *Chronicle* (1724), and that of Peter Langtoft (1725). The *Bibliotheca Hearniana* was published in 1848; *Reliquiæ Hearnianæ*, by Philip Bliss, in 1857. The third volume of *Remarks and Collections of Thomas Hearne* appeared in 1889, edited by C. E. Doble for the Oxford Historical Society. See *Impartial Memorials* of his life by several hands (1736), and the *Lives of Leland, Hearne, and Wood* (Oxford, 1772).

Hearsay. See EVIDENCE.

Hearse, or HERSE (through Fr. from Lat. *hirpex*, 'a harrow'), the carriage in which the dead are conveyed to the grave, but originally the term applied to a triangular bar or framework with upright spikes for holding candles at a church service, and especially at funeral services. It was originally very simple in form, but in the 15th and 16th centuries hearses of great splendour came into use, and were erected in the churches over the bodies of distinguished personages. The framework was of iron or brass, sometimes of beautiful workmanship, square, octagonal, &c. in plan, with pillars at the angles, and arched framework above forming a canopy. The whole was hung over with rich cloths and embroidery, and lighted up with hundreds of wax candles, and decorated with wax images. From this the transition to the modern funeral hearse can be easily traced. In Catholic churches the old hearse still exists as a triangle with spikes, on which candles are placed.

Heart, the central organ of the circulatory system, acting as a force and suction pump in relation to the blood-vessels. It always lies dorsally in Invertebrates, ventrally in Vertebrates, and arises from the strong development of one or more blood vessels. In Vertebrates, the resulting cylinder, lying in the throat region of the embryo, is divided into receiving and expelling portions, *auricle* and *ventricle* respectively, and the whole is enclosed in a more or less marked cavity or ensheathing double bag, the *pericardium*. By curvature and folding, by formation of partitions and ingrowth of valves, the three or four chambered hearts of the higher vertebrates arise. It will be enough to describe the general structure and function of the heart in man.

The human heart lies ventrally in the chest, between the two lungs; it has a broad end or 'base' directed upwards and backwards, and a pointed end or 'apex,' turned downwards, forwards, and to the left; it is kept in position by the attachment of the enswathing pericardium to the upper surface of the Diaphragm (q.v.), and by the large blood-vessels which enter or leave its four chambers; its total size is approximately equal to that of its owner's closed fist. There are two receiving chambers or auricles, of which the right receives all the impure blood brought by the *vena cavæ* from head and body and by the *coronary vein* from the substance of the heart itself, while the left is filled with purified blood brought by the pulmonary veins from the lungs. The auricles pass their contents to the two driving chambers or ventricles, of which the right pumps the impure blood to the lungs, and the left sends the pure blood to the head and body. The ventricles are larger than the auricles, and have strong muscular walls proportionate to their harder work. The left ventricle is stronger than, and partially surrounded by, the thinner right chamber. The right auricle opens into the right ventricle by an aperture guarded by a triple (*tricuspid*) valve, whose three membranous lappets are attached to tendinous cords (*chordæ tendineæ*) arising from muscular processes (*musculi papillares*) on the walls of the ventricle. The opening from the left auricle into the left ventricle is similarly guarded by a double (*mitral* or *bicuspid*) valve. These valves on each side prevent the passage of blood from ventricle to auricle. At the base of the pulmonary artery on the right and of the aorta on the left, there are three pocket-

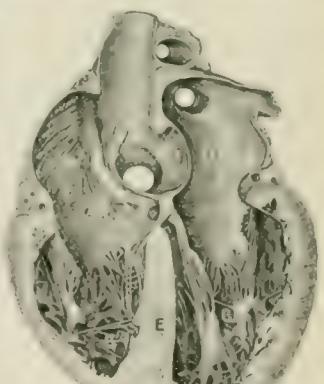

Fig. 1. Section of the Human Heart (after His):
A, right auricle; B, right ventricle; C, left ventricle; D, left auricle; E, partition between the two ventricles. Between the auricles and ventricles on right and left, the tricuspid and mitral valves with their cords and associated muscles are shown.

like (*semilunar*) valves, which prevent backflow from vessels to ventricles.

When the heart is at work, the simultaneous contraction of the two auricles (i.e. of the muscle fibres on their walls) is followed by a similar contraction of the ventricles, and this by a pause or passive interval of re-expansion, after which the rhythm of contraction recommences. In the contraction of the auricles, the mass of blood in the large veins will not permit of a backflow in a peripheral direction, so that virtually all the contents of the auricles pass into the respective ventricles, which at that moment are flaccid and uncontracted. As the ventricles fill, the valves between them and the auricles are partly closed, and this is perfectly accomplished when the contraction of the ventricle sets in. As no blood can then pass back from ventricle to auricle, the energy of ventricular contraction is directed to overcoming the resistance of the semilunar valves guarding the entrance to the pulmonary artery and the aorta, which are moreover elastic vessels full of blood. The state of contraction in auricle or ventricle is called the *systole*; the state of passive relaxation and expansion the *diastole*, and it is evident that by the systole of the auricles the ventricles are filled, and that by the systole of the ventricles their contents are for the most part forced into the arterial systems of lungs and body. As the heart usually beats about seventy-two times a minute, the cycle of events just noted lasts about $\frac{8}{10}$ths of a second, of which the systole of the ventricle lasts about $\frac{3}{10}$ths, that of the auricle perhaps $\frac{1}{10}$th, and the passive interval about $\frac{4}{10}$ths of a second.

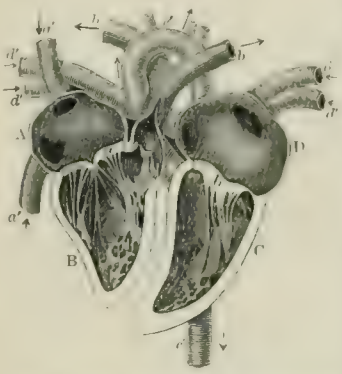

Fig. 2. Diagram of Heart halved and laid open (after Debierre):

A, B, C, D, as in fig. 1. *a*, part of tricuspid valve; *b*, part of mitral; *c*, semilunars at case of pulmonary artery. *a'*, *a''*, inferior and superior vena cava entering A; *b*, *b'*, pulmonary arteries proceeding from B; *c'*, aorta proceeding from C; *d*, *d'*, pulmonary veins entering D.

The activity of the heart has several external indices, such as the *beating*, seen and felt between the fifth and sixth rib on the left side, due to contraction of the ventricles, which makes the 'apex' of the heart strike against the pericardium, and through this on the wall of the chest. There are also sounds produced by the heart: (*a*) the longish dull sound probably caused by the contraction of the muscular fibres of the ventricles and the tension of the valves between these chambers and the auricle; (*b*) the sharp sound due to the sudden closure of the semilunar valves when the contraction of the ventricles ceases. The heart sounds are of great importance in the diagnosis of disease of the heart. They may undergo various changes and may in some cases disappear or be replaced by or accompanied by *murmurs*. These murmurs are caused by the blood flowing through the orifices of the heart which have become changed by disease. At a distance from the heart, the *pulse* or regular dilatation of an elastic artery is a familiar index. The heart is under the control of three sets of nerves: (*a*) from ganglia in its own substance, apparently essential to the regular rhythm of contraction; (*b*) from the sympathetic system, apparently affecting rapidity of action; (*c*) from the pneumogastric or vagus nerve, coming directly from the brain, apparently with arresting power. See AORTA, ARTERY, BLOOD, CIRCULATION; text books of Anatomy by Quain, Turner, Mivart, Macalister, &c.; of Physiology by Foster, Huxley, Landois and Stirling, &c.

DISEASES OF THE HEART are either those affecting the various tissues composing the heart, or the nervous arrangements governing the heart.

(1) *Diseases of Structures composing Heart* may be primary or secondary.

(*a*) *Primary Diseases.* All the various tissues of the heart may be primarily affected. The *Pericardium* (sac surrounding heart) may be affected with inflammation (*pericarditis*). This is by no means an uncommon condition in rheumatic fever, while it also occurs in connection with some of the acute exanthemata. Fluid tends to be effused into the sac, and this produces great impairment of the heart's action. The condition frequently leads to a fatal termination. Various *tumours* may occur in connection with the pericardium.

The *Myocardium* (muscular wall of heart) may also be affected with inflammation leading to very irregular and impaired action of the heart, and often to death. This is known as *myocarditis*, and if the fatal termination does not ensue in the acute stage of the disease, the wall of the heart is apt to be left in a weakened condition due to the pathological changes set up in the course of the inflammation. The myocardium may occasionally be the seat of tumours. The muscular substance of the heart may undergo a *fatty degeneration*, which may produce death either from failure of the heart, or more rarely by rupture of the wall.

The *Endocardium* (lining membrane of heart; also forms the valves of the heart) is the most common seat of inflammation in rheumatic subjects and in individuals suffering from scarlet fever or from some other of the exanthemata. This *endocarditis* is specially apt to attack the valves of the left side of the heart, and to lead to deformity and the imperfect action of these important structures. When this occurs the well-known train of symptoms commonly associated with heart disease are apt to appear—breathlessness, palpitations, irregular heart's action, dropsy, albuminuria, &c.; while the various signs of valvular disease, among the most important of which is the alteration in the sounds of the heart, and the development of murmurs may also be determined. In many cases, however, in spite of disease of the valves, the heart may continue to act satisfactorily. But there is always a great danger of its proving inadequate to the additional work thus put upon it, and of its suddenly failing under any extra strain.

There is one peculiar form of inflammation of the endocardium known as *acute ulcerative endocarditis* which is exceedingly fatal, and which is due to the development of micro-organisms in the heart. Certain slow degenerative changes may also affect the endocardium, more especially where it composes the aortic valves (*Atheroma*).

In all inflammatory affections of the heart there is a tendency for all the structures to be involved at one and the same time.

(*b*) *Secondary Diseases.*—As the result of various morbid states of other parts of the body, the heart, and more especially its muscular wall, may become secondarily affected. Thus in *fever* the muscular substance of the heart manifests the condition of *cloudy swelling*, and thus becoming weakened tends to yield to the pressure of blood inside the heart, and to undergo dilatation. This state of the organ is frequently accompanied by the develop-

ment of murmurs due to the imperfect action of the valves between the auricles and ventricles allowing the blood to flow backwards through the orifices. At the same time the various symptoms of disturbed circulation are developed.

In the various forms of *anæmia* (bloodlessness), whether primary or secondary to other diseases, the muscle of the heart becomes debilitated, and a similar series of signs and symptoms to those just described make their appearance.

In certain diseases in which the blood pressure is raised (Bright's Disease), or when any condition throws extra work on the heart for a considerable period, the organ becomes *hypertrophied*—i.e. increased in size and strength. This is well seen when the valves are diseased, and the muscular substance is well nourished.

(2) *Derangements of Nervous Mechanism of Heart.* As a result of many totally different conditions the sensory nervous mechanism of the heart may be affected, and give rise to pain or to various sensations in the region of the heart. These sensations are not, however, always indicative of organic disease of the organ.

A peculiar set of symptoms, known as *angina pectoris*, are treated more fully under a separate head. The patient suffers from attacks, the chief symptom of which is a dreadful feeling of impending death, usually with cardiac pain. When occurring as the result of organic heart disease these symptoms are most commonly connected with disease of the aortic valves.

The various nervous arrangements presiding over the movements of the heart may also become deranged, and lead to increased or diminished heart's action or to irregular action. The last is the most frequent, and is a very common accompaniment of organic disease, though it frequently occurs in individuals entirely free of any such condition. Nervous and gouty individuals and those addicted to the excessive use of tobacco are common sufferers from such *palpitations*.

The words 'broken heart' seem to suggest a form of heart disease. But of course the expression arose out of the long prevalent and now wholly obsolete view that the heart is in some way the seat of the affections—a view inevitably suggested by the quickening of the pulse under emotion, or its temporary stoppage from a sudden shock.

Heart, Sacred. See Sacred Heart.

Heart-burial, or the burial of the heart in a place separate from that in which the body is laid, seems to have been once practised by the ancient Egyptians. In European countries it was most common in the 12th and 13th centuries, though instances have occurred in all centuries down to and including the 19th. The practice undoubtedly arose out of the special veneration in which the heart was held as the seat of the affections and of certain of the higher virtues, as courage, piety. Besides the heart, other parts of the body, such as the viscera, were sometimes honoured with separate burial. It has been suggested that this distribution of the body for sepulture was prompted by a wish to secure the prayers of more than one congregation for the soul of the deceased. In other instances, where the deceased has died abroad and his heart has been carried home for burial, the motive is simpler to understand. The persons who have been honoured with separate burial for the heart have been for the most part men and women of royal birth and ecclesiastics of high rank. Amongst royal personages may be enumerated Henry I. and Richard I. of England, whose hearts were interred at Rouen; Henry III., whose heart was buried at Fontevraud in Normandy; Eleanor, wife of Edward I., at Lincoln; Edward I. himself, whose heart was sent to Jerusalem for burial, as was that of Robert Bruce (q.v.); the French kings, Louis XII., XIII., and XIV., Francis I. and II., and Henry II. and III.; the Emperor Leopold of Austria; and James II. of England, whose heart was entombed in St Mary of Chaillot near Paris. The heart of Anne de Montmorency, constable of France, was interred at Les Célestins; that of Lord Edward Bruce at Culross Abbey in Perthshire, his body in Bergen-op-Zoom in Holland; and that of Sir William Temple at Moor Park near Farnham. The viscera of the popes from Sixtus V. (1590) onwards were interred in SS. Vincenzo and Anastasio, the parish church of the Quirinal. Daniel O'Connell's heart is buried at Rome; Shelley's '*cor cordium*' at Bournemouth; and that of the French marshal, Kellermann, on the battlefield of Valmy. The practice was prohibited by Pope Boniface VIII. (1294–1303); but the prohibition was removed by Benedict XI., at all events so far as the French royal family was concerned. The Marquis of Bute's heart was carried to Jerusalem and buried on the Mount of Olives in November 1900. See Pettigrew, *Chronicles of the Tombs* (1857), pp. 249 *et seq.*

Heart-burn. See Indigestion.

Hearth-money, an unpopular tax of two shillings levied on every hearth in all houses 'paying to church and poor;' first imposed in 1663, and abolished in 1689.

Heart's Content, a port of Newfoundland, on the east side of Trinity Bay, with 900 inhabitants. Two Atlantic cables land here.

Heart's-ease. See Violet.

Heat, the cause of the sensation of warmth, and of a multitude of common phenomena in nature and art. In considering this subject scientifically it is necessary from the outset to discard the ideas conveyed by the popular use of such words as hot and cold. A number of bodies, however different, left for a long enough time in the same room, must, as we shall see further on, acquire the same *temperature*, or become in reality equally warm. Yet in popular language some, as metals, stones, &c., are pronounced to be cold, and others, as flannel and fur, warm. The touch, then, is *not* a means by which we can acquire any definite idea of the temperature of a body.

Nature of Heat. A heated body is no heavier than it was before it was heated; if, therefore, heat be a material substance, as it was long considered, it must be *imponderable*. And, in fact, under the name of caloric, it is classed in almost all but modern treatises as one of the family of imponderables. But if it were *matter*, in any sense of the word, its quantity would be unchangeable by human agency. Now we find that there are cases in which heat is produced in any quantity without flame, combustion, &c., as in melting two pieces of ice by rubbing them together, and also cases in which a quantity of heat totally disappears. This is utterly inconsistent with the idea of the materiality of heat. The only hypothesis that at all accords with the phenomena is that *heat depends upon motion of the particles of a body*, being in fact Energy (q.v.), not matter; and with this idea we shall start.

Temperature.—When two bodies are placed in contact, heat will in general pass from one to the other, with the effect of cooling the first and warming the second. This process goes on until the two acquire the same temperature. Thus temperature is a condition of a body, determining, as it were, the *head* of the heat which the body contains—to take the obvious analogy of water in a cistern or a mill-pond. In this sense it is analogous also to the pressure of gas in a receiver, or to the potential in

an electrified conductor. By the help of the 'specific heat' of bodies (which will be treated later) we can determine from their change of temperature how much heat they gain or lose. The scientific or *absolute* measurement of temperature can only be alluded to here. It depends upon theoretical considerations, for which see THERMO-DYNAMICS.

Measure of Heat. Whether it be a vibration, such as light and sound (as in some cases it certainly is), or consist in independent motions of the particles of a body, leading to a succession of *impacts* on each other and on the walls of the containing vessel (as is almost certainly the case in gases), it is none the less certain that the *amount* of heat in a body is to be measured by the energy of moving particles. But as we cannot observe those particles so as to ascertain their vis-viva, we must have as a preliminary some artificial unit in terms of which to measure heat. This will be described later. But in order that this process may be applied we must have some means of measuring the temperature of a body, depending upon an *effect* of heat. Whatever that effect may be, it is obvious that, as the laws of nature are uniform, it will afford us a *reproducible* standard, by which we can estimate at any time and at any place an amount of heat, and compare that amount with another observed somewhere else; just as the French Mètre (q.v.) is reproducible at any time, being (at least by its original definition) the ten-millionth part of a quadrant of the meridian.

Dilatation or Expansion.—Now, one of the most general and notable effects which heat produces on matter is to *expand* it. The length of a metallic bar varies with every change of temperature, and is ever the same at the same temperature. The fixing of the tire of a cart-wheel is a very good instance. No hammering could fit an iron hoop so tightly on the wood-work of the wheel as does the simple enlarging of the tire by heat, and its subsequent contraction by cold. It is thus possible to *slip* it on, and an enormous force is secured to bind the pieces together. In almost every kind of structure the expansion and contraction from changes of temperature require to be guarded against. In the huge iron tubes of the Britannia Bridge the mere change of the seasons would have produced sufficient changes of length to tear the piers asunder, had each end of a tube been fixed to masonry. Watches and clocks, when not compensated (see PENDULUM), go faster in cold weather, and slower in hot, an immediate consequence of the expansion or contraction of their balance-wheels and pendulums.

If a flask *full* of water or of alcohol be dipped into hot water or held over a lamp, the flask is heated first, and for a moment appears not quite full, but as heat reaches the liquid it expands in turn, and to a greater degree than the flask, so that a portion of the liquid runs over; a glass shell which just floats in a vessel of water, sinks to the bottom when the water is heated; and as water is gradually heated from below, the hotter water continually rises to the surface. Indeed, if this were not the case, it would be impossible to prevent explosions every time we attempted to boil water or any other fluid. If a bladder, partly filled with air, and tightly tied at the neck, be heated before a fire, the contained air will expand, and the bladder will be distended. As it cools it becomes flaccid again by degrees.

These and like instances are sufficient to show us that *in general* all bodies expand by heat. In order, then, to prepare a reproducible means of measuring temperature, all we have to do is to fix upon a substance (mercury is that most commonly used) by whose changes of volume it is to be measured, and a reproducible temperature, or rather two reproducible temperatures, at which to measure the volume. Those usually selected are—that at which water freezes, or ice melts, and that at which water boils. In both of these cases the water must be *pure*, as any addition of foreign matter in general changes the temperature at which freezing or boiling takes place. Another important circumstance is *the height of the barometer* (see BOILING). The second reproducible temperature is therefore defined as that of water boiling in an open vessel when the barometer stands at 30 inches. In absolute strictness, this should also be said of the freezing-point, but the effect on the latter of a change of barometric pressure is practically insensible. The practical construction of a heat-measurer or *thermometer* on these principles, the various ways of graduating it, and how to convert the readings of one thermometer into those of another, are described in the article THERMOMETER. In the present article we suppose the Centigrade thermometer to be the one used.

If we make a number of thermometer tubes, fill them with different liquids, and graduate as in the Centigrade, we shall find that, though they all give 0° in freezing and 100° in boiling water, no two in general agree when placed in water between those states. *Hence the rate of expansion is not generally uniform for equal increments of temperature.* It has been found, however, by very delicate experiments, which cannot be more than alluded to here, that mercury expands *nearly* uniformly for equal increments of temperature. However, what we sought was not an *absolute* standard, but a *reproducible* one; and mercury, in addition to furnishing this, may be assumed also to give us approximately the ratios of different increments of temperature.

We must next look a little more closely into the nature of dilatation by heat. And first, of its *measure*. A metallic rod of length l at 0° increases at $t°$ by a quantity which is proportional to t and to l. Hence, k being some numerical quantity, the expanded length $l' = l(1 + kt)$. Here k is called the coefficient of linear dilatation. For instance, a brass rod of length 1 foot at 0° becomes at $t°$ $(1 + \cdot0000187t)$ feet; and here k, or the coefficient of linear dilatation for one degree (Centigrade), is $\cdot0000187$; or a brass rod has its length increased by about one fifty-three thousandth part for each degree of temperature.

If we consider a bar (of brass, for instance) whose length, breadth, and depth are l, b, d—then, when heated, these increase proportionally. Hence

$$l' = l(1 + kt),$$
$$b' = b(1 + kt),$$
$$d' = d(1 + kt),$$

and therefore the volume of, or space occupied by, the bar increases from V or lbd to V′ or $l'b'd'$.

Hence $V' = V(1 + kt)^3$,
$= V(1 + 3kt)$ nearly, since k is *very small*.

Therefore we may write $V' = V(1 + Kt)$, where we shall have as before K, the coefficient of *cubical* dilatation for 1° of temperature. And, as $K = 3k$, we see that, for the same substance, the *coefficient of cubical dilatation is three times that of linear dilatation*.

In the following table these coefficients are increased a hundredfold, as it gives the proportional increase of length for a rise of temperature from 0° to 100° Centigrade. It must also be remarked that, while the *linear* dilatation of solids is given, it is the cubical dilatation of liquids and gases which is necessarily given. Moreover, as the latter are always measured in glass, which itself dilates, the results are only *apparent*; they are too small, and require correction for the cubical dilatation of glass. This, however, is comparatively very

small, and a rough approximation to its value is usually sufficient.

Glass	·0198	Water	·0482
Iron	·1098	Alcohol	·1103
Zinc	·0955	Air	·2669
Mercury	·0306	Hydrogen	·3405

There is one specially remarkable exception to the law that bodies expand by heat—viz. that of water under certain circumstances. From 0° (Centigrade), at which it melts, it *contracts* as the temperature is raised, up to about 4° C., after which it begins to expand like other bodies. We cannot here enter into speculations as to the cause of this very singular phenomenon, but we will say a few words about its practical utility. Water, then, is *densest* or *heaviest* at 4° C. Hence, in cold weather, as the surface water of a lake cools to near 4°, it becomes heavier than the hotter water below, and sinks to the bottom. This goes on till the whole lake has the temperature 4°. As the surface-cooling proceeds further, the water becomes *lighter*, and therefore remains on the surface till it is frozen. Did water not possess this property, a severe winter might freeze a lake *to the bottom*, and the heat of summer might be insufficient to remelt it all.

Specific Heat. The thermometer indicates the *temperature* of a body, but gives us no direct information as to the *amount* of heat it contains. Yet this is measurable, for we may take as our UNIT the amount of heat required to raise a pound of water from 0° to 1°, which is of course a definite standard. As an instance of the question now raised—Is *more* heat (and if so, *how much more*) required to heat a pound of water from zero to 10° than to heat a pound of mercury between the same limits? We find by experiment that bodies differ extensively in the amount of heat (measured in the units before mentioned) required to produce equal changes of temperature in them.

It is a result of experiment (sufficiently accurate for all ordinary purposes) that, if equal weights of water at different temperatures be mixed, the temperature of the mixture will be the arithmetic mean of the original temperatures. From this it follows, with the same degree of approximation, that equal successive amounts of heat are required to raise the same mass of water through successive degrees of temperature. As an instance, suppose one pound of water at 50° to be mixed with two pounds at 20°, the resulting temperature of the mixture is 30°; for the pound at 50° has lost 20 heat units, while each of the other two pounds has gained 10 such units, transferred of course from the hotter water. Generally, if m pounds of water at t degrees be mixed with M pounds at T degrees (the latter being the colder), and if θ be the temperature of the mixture—the number of units lost by the first is $m(t-\theta)$, since *one* is lost for *each* pound which cools by *one* degree; and that gained by the second is $M(\theta - T)$, and these must be equal. Hence $m(t-\theta) = M(\theta - T)$; whence, at once,

$$\theta = \frac{mt + MT}{m + M}.$$

But if we mix water and mercury at different temperatures, the resulting temperature is found *not* to agree with the above law. Hence it appears that *to raise equal weights of different bodies through the same number of degrees of temperature requires different amounts of heat.* And we may then define the *specific heat* of a substance as the number of units of heat (as above defined) required to raise the temperature of *one* pound of it by *one* degree.

From the definition of a unit of heat it is at once seen that our numerical system is such that the specific heat of water is unity; and, in general, the specific heats of other bodies are less, and are therefore to be expressed as proper fractions. For example, if equal weights of water and mercury be mixed, the first at 0°, the second at 100°, the resulting temperature will not be 50° (as it would have been had both bodies been water), but 3°·23 nearly; in other words, the amount of heat which raises the temperature of one pound of water 3°·23 is that which would raise that of one pound of mercury 96°·77, or the specific heat of mercury is $\frac{1}{30}$th of that of water. The following may be given as instances of the great differences which experiment has shown to exist among bodies in respect of specific heat: Water, 1·000; turpentine, ·426; sulphur, ·203; iron, ·114; mercury, ·033.

It is mainly to the great specific heat of water that we are indebted for the comparatively small amount of it required to cool a hot body dropped into it; for its comparatively small loss of temperature when it is poured into a cold vessel; and for the enormous effects of the water of the ocean in modifying climate, as by the Gulf Stream.

It has been found generally that the specific heats of elementary solids are nearly *inversely* as their Atomic Weights (q.v.). *Hence their atoms require the same amount of heat to produce the same change in their temperature.* Thus, for simple bodies, we have atomic weight of mercury, 100; its specific heat, ·033; product, 3·3; atomic weight of iron, 28; its specific heat, ·114; product, 3·2. A similar remark may be made, it appears, with reference to compound bodies of any one type; but, in general, the product of the specific heat and the atomic weight differs from one type to another.

Latent Heat, Fusion, Solution, and Vaporisation.—We are now prepared to consider the somewhat complex effects produced by heat on the molecular constitution of bodies; and, conversely, the relations of solidity, fluidity, &c. to heat. All solid bodies (except carbon, which has been *softened* only) have been melted by exposure to a sufficiently high temperature. The laws of this fusion are:

(1) *Every body has a definite melting point, assignable on the thermometric scale, at the pressure to which it is subjected to the same.*

(2) *When a body is melting, it retains that fixed temperature, however much heat may be supplied, until the last particle is melted.* The last result is most remarkable. The heat supplied does not raise the temperature, but *produces the change of state.* Hence it seemed to disappear, as far as the thermometer is concerned, and was therefore called *latent* heat.

A pound of water at 79° C. added to a pound of *water* at 0° C. produces, of course, two pounds of water at 39°·5. *But* a pound of water at 79° C. added to a pound of *ice* at 0° C. produces two pounds of water at 0°. Heat, then, has *disappeared* in the production of a change from solidity to fluidity. And this we might expect from the conservation of Energy (q.v.), for energy in the shape of heat must be consumed in producing the potential energy of the molecular actions of the separate particles in the fluid. For every pound of ice melted, without change of temperature, 79 units of heat are thus converted into potential energy of molecular separation.

We give a few instances of latent heat of fusion: Water (as above), 79·0; zinc, 28·1; sulphur, 9·4; lead, 5·4; mercury, 2·8.

In law 1 it is mentioned that constancy of pressure is necessary. In fact, the freezing (or melting) point of water is *lowered* by increase of pressure, while those of sulphur or wax are *raised;* but these effects, though extremely remarkable, are *very small.* Most bodies contract on solidifying; but some, as water, cast-iron, certain alloys, &c., *expand.* Thus a severe frost, setting in after

copious rain, splits rocks, &c., by the expansion of freezing water; and thus also we obtain in iron the most delicate and faithful copy of a mould, and in the fusible alloy a clear-cut copy of a type. The modern dynamical theory of heat (thermo-dynamics) enables us to see that a perpetual motion would be procurable if bodies which contract on solidifying had *not* their melting-point raised by pressure, and *vice versâ*.

Analogous to the fusion of a solid is its *solution* in a liquid, or the mutual conversion into liquids of two solids which are intimately mixed in powder. Here, also, we should expect kinetic energy, in the shape of heat, to be used up in producing the potential energy of the liquid state; and, indeed, such is always the case. Such changes of arrangement destroy heat or produce cold; but this in many cases is not the effect observed, as there is generally heat developed by the *loss* of potential energy if there be *chemical* action between the two substances. Hence, in general, the observed effect will be due to the difference of the heat *generated* by chemical action and that *absorbed* in change of state.

If a quantity of pounded nitrate of ammonia (a very soluble salt) be placed in a vessel, an equal weight of water added, and the whole stirred for a minute or two with a test-tube containing water, the heat required for the solution of the salt will be abstracted from all bodies in contact with the solution, and the water in the test-tube will be frozen. In this sense the arrangement is called a *freezing mixture*. For additional illustrations of heat becoming latent, see FREEZING MIXTURES.

Of course the converse of this may be expected to hold, and latent heat to become sensible when a liquid becomes solid. As an example, when a supersaturated solution of sulphate of soda begins to deposit crystals of the salt with great rapidity the temperature rises very considerably; and it is the disengagement of latent heat that renders the freezing of a pond a slow process, even after the whole of the water has been reduced nearly to the freezing-point.

Vaporisation.—Almost all that has been said on the subject of fusion is true of vaporisation, with the change of a word or two. Thus, however much heat we supply to a liquid, the temperature does not rise above the boiling-point. Heat, then, becomes *latent* in the act of vaporisation, or rather is *converted into* the potential energy involved in the change of state. It is found by experiment that 540 units of heat (each sufficient to heat a pound of water 1° C.) disappear in the conversion of a pound of water into steam. Hence a pound of steam at 100° C. is sufficient to raise 5·4 pounds of water from zero to the boiling-point.

COMMUNICATION OF HEAT.—There are at least three distinct ways in which this occurs, and these we will take in order.

Conduction.—Why is it that, if one end of a poker and of a glass or wooden rod be put into a fire, we can keep hold of the other end of the latter much longer than we can of the former? The reason is that heat is more readily transmitted in the iron from particle to particle than it is in glass or wood. This is conduction. It is to be noticed, however, that in this experiment a great portion of the heat which passes along each rod is given off into the air by the surface. The mathematical theory of conduction has been most exquisitely investigated by Fourier, but on the supposition that the rate at which heat passes from a warmer to a colder portion of a body is proportional to the *difference* of temperature. As most of the experiments which have been made with the object of ascertaining the *conductivity* (*not* conductibility, the erroneous word too commonly in use) of different bodies have been made in this way, it is not surprising that our knowledge on this point is very meagre indeed. We know that silver and copper conduct better than most other metals, and that the metals in general conduct better than other solids; but our further information is neither very extensive nor very definite. The first determinations of conductivity which are at all trustworthy are those of Forbes. His method was immensely superior to those of his predecessors. Before we give one or two numerical data, we must explain what the numbers mean. The following definition is virtually that of Fourier:

The thermal conductivity of a substance is the number of units of heat which pass per unit of surface per unit of time, through a slab of unit thickness, whose sides are kept at temperatures differing by 1° C. Taking the unit of heat as above described, a foot as unit of length and a minute as unit of time, the conductivity of iron is about 0·8, while that of copper varies from 4 to little more than 2. (Very slight impurities affect to a great extent both the thermal and the electric conductivity of copper.) Contrasted with these we find that the conductivity of rocks is very small, ranging from 0·015 to 0·04.

In conjunction with their radiating power (see next section), the conductivity of bodies is most important as regards their suitableness as articles of clothing for hot or cold climates, or as materials for building or furnishing dwelling-houses. We need but refer to the difference between linen and woollen clothing, or to the difference (in cold weather) of sensation between a carpet and a bare floor, in order to show how essential the greater or less conducting power of bodies is to our everyday comfort.

Radiation.—By this is understood the passage of heat, not from particle to particle of one body, but through air or vacuum, and even through solid bodies (in a manner and with a velocity quite different from those of conduction) from one body to another. There can be no doubt whatever as to radiant heat being *identical* with light, differing from red light, for instance, as red light differs from blue—i.e. having (see LIGHT) longer waves than those corresponding to red light. This idea might easily have arisen during the contemplation of a body gradually heated. At first it remains dark, giving off only rays of heat; as its temperature increases it gives us, along with the heat, a low red light, which, by the increase of the temperature, is gradually accompanied by yellow, blue, &c. rays, and the incandescent body (a lime-ball, for instance) finally gives off a light as white as that of the sun, and which therefore contains all the colours of sunlight in their usual proportions. In fact there is great reason to believe that the sun is merely a mass of incandescent matter, probably in the main gaseous, and that the radiations it emits, whether called heat or light, merely differ in *quality*, not in *kind*. Taking this view of the subject at the outset, it will be instructive to compare the properties of radiant heat with those of light throughout. It must be understood when we make this comparison that the term *heat* is improperly used in this connection. Radiant heat is not heat in the ordinary sense of the word. It is a form of energy, a *transformation* of the heat of a hot body, and can be transformed into heat again when it is absorbed, but on its passage it is not what we ordinarily understand by the word heat.

Light, then, *moves* (generally) *in straight lines*. This is easily verified in the case of heat by the use of the thermo-electric pile and its galvano

meter. Placing the pile *out* of the line from a source of heat to an aperture in a screen, *no* effect is observed; but deflection of the needle at once occurs when the pile is placed in the line which light would have followed if substituted for the heat.

A concave mirror, which would bring rays of light proceeding from a given point to a focus at another given point, does the same with heat, the hot body being substituted for the luminous one, and the pile placed at the focus. Heat, then, is *reflected* according to the *same laws* as light. A burning lens gives a capital proof of the sun's heat and light being subject to the same laws of *refraction*. When the solar Spectrum (q.v.) is formed by means of a prism of rock-salt (the reasons for the choice of this material will afterwards appear), the thermo-electric pile proves the existence of heat in all the coloured spaces, increasing, however, down to the red end of the spectrum, and attaining its maximum *beyond* the visible light, just as if radiant heat were (as it *must* be) light with longer waves.

Some bodies, as glass, water, &c., transmit, when in thin plates, most of the light which falls on them; others, as wood, metal, coloured glass, &c., transmit none or little. A plate of rock-salt, half an inch thick, transmits 96 per cent. of the rays of heat which fall on it; while glass, even of a thickness of one-tenth of an inch, transmits very little. In this sense, rock salt is said to be *diathermanous*, while glass is said to be adiathermanous, or only partially diathermanous. Most of the simple gases, such as oxygen, hydrogen, &c., and *mixtures* of these, such as air, oppose very little resistance to the passage of radiant heat; but the reverse is in general the case with compound gases. It has recently been asserted that water-vapour in particular is exceedingly adiathermanous. The question is one of very considerable difficulty, owing to the fact that it is almost impossible to experiment upon vapour alone. The presence of dust particles always produces deposition of *water*, which is a very good absorber of radiant heat.

But there are other remarkable phenomena of radiant heat which are easily observed, and which have their analogy in the case of light. (1) Unstained glass seems equally transparent to all kinds of light. Such is the case with rock-salt and heat. (2) Light which has passed through a blue glass (for instance) loses far less per cent. when it passes through a second plate of blue glass. Similarly heat loses (say) 75 per cent. in passing through *one* plate of crown-glass, and only 10 per cent. of the remainder (say) in passing through a second. (3) Blue light passes easily through a *blue* glass, which almost entirely arrests red light. So dark heat passes far less easily through glass than bright heat does. These analogies, mostly due to Melloni, are very remarkable.

Again, light can be *doubly refracted*, *plane polarised*, *circularly polarised*. All these properties have been found in radiant heat by Principal Forbes.

The beautiful investigations of Stokes, Balfour Stewart, and Kirchhoff have shown us that bodies which most easily *absorb* light of a particular colour give off most freely, when heated, light of that colour; and it is easily shown by experiment that those surfaces which absorb heat most readily also radiate it most readily. Thus, it was found by Leslie that when a tinned-iron cube full of boiling water had one side polished, another roughened, a third covered with lampblack, &c., the polished side radiated little heat, the roughened more, while the blackened side radiated a very great quantity indeed. And again, that if we have (say) three similar thermometers, and if the bulbs be (1) gilded, (2) covered with roughened metal, (3) smoked, and all be exposed to the same radiation of heat, their sensibility will be in the order 3, 2, 1. A practical illustration of this is seen in the fact that a *blackened* kettle is that in which water is most speedily made to boil, while a polished one keeps the water longest warm when removed from the fire. Again, if a willow pattern plate be heated white-hot in the fire, and then examined in a dark room, the pattern will be reversed—a white pattern being seen on a dark ground. It is this law of equality of radiating and absorbing powers that mainly gives rise to the superior comfort of white clothing to black in winter as well as in summer; radiating less in winter, it absorbs less in summer.

Much has been argued about the separate existence of *cold*, from such facts as these: A piece of ice held before the thermo-electric pile produces an opposite deflection of the galvanometer to that produced by a hot ball. If a freezing mixture be placed at one focus of a spheroidal mirror, and a thermometer with a blackened bulb at the conjugate focus, the latter will fall speedily, though very far off from the mixture. Now, the true explanation of such observations is to be found in what is called the 'Theory of Exchanges,' first enunciated by Prévost, and since greatly extended and carefully verified by Stewart, which is to this effect: 'Every body is continually radiating heat in all directions, the amount radiated being greater as the temperature is higher.' Thus the radiation from a body depends on *itself* alone, the amount absorbed depends on the radiation which reaches it. Hence the apparent radiation of cold in the experiments above mentioned is due to the fact of the pile or thermometer *radiating off more heat than it receives*, as its temperature is higher than that of the freezing mixture to which it is opposed. From this it is evident that any number of bodies left near each other tend gradually to assume a common temperature. By this theory of exchanges we explain the cold felt in sitting opposite an open window in a frosty day, even when there is no draught.

Convection.—A hot body cools faster in a current of air than in a still atmosphere of the same temperature, evidently because fresh supplies of the colder air are continually brought into contact with it. This carrying off of its heat by a stream of air is an example of convection. It is by convection mainly that heat is conveyed throughout liquids and gases. Thus, when a lamp is applied to the bottom of a vessel of water the heat does not diffuse itself in the water as it would (by conduction) in a mass of metal, but the expansion of the heated water at the bottom rendering it lighter, bulk for bulk, than the superincumbent fluid, causes it to rise to the surface; and thus, by convection, the heat is diffused through the mass. Conduction, properly so called, can scarcely be shown, though it really exist, in liquids or gases, on this account. The tremulous appearance of any object as seen by light which passes near a hot surface, as that of a boiler or a red-hot poker, is due to the convection of heat in the air, the warm

current refracting light less than does the cold air. See VENTILATION.

For the mechanical applications of heat, see AIR-ENGINE, STEAM-ENGINE, &c., and for their theory, see THERMO-DYNAMICS.

Sources of Heat.—They may be, so far as we know, ultimately reduced to two—chemical combination and mechanical energy; and, indeed, in all probability the former is only a variety of the immensely different forms in which the latter is manifested. A more full examination of this point, and a general statement of the ultimate nature of the various sources of heat, will be found in the article ENERGY above referred to. See also COMBUSTION, FUEL; and for heating apparatus, see WARMING.

Heath (*Erica*), a genus of small shrubs of the natural order Ericeæ, distinguished by a calyx of four leaves, a bell-shaped or ovate—often ventricose—corolla, and a 4-celled, 4 S-valved capsule. The leaves are small, linear, and evergreen. The genus consists of about 400 species,

Heaths.

besides innumerable hybrids and varieties raised in gardens. The home of the genus is in the western part of South Africa, but a few species are distributed over western and northern Europe. *E. vulgaris*—now generally named by botanists *Calluna vulgaris* (fig. 1)—is the most widely distributed of all heaths, extending as it does over central and northern Europe to the Arctic Circle. It is the ling, heath, or heather of British moors and mountains. The genus is not found in Asia, America except in Labrador, Cape Breton, Nova Scotia, and parts of New England, where the common heath occurs—nor in Australia. Six species, including the ling, are found in the British Isles.

Cross-leaved Heather (*E. tetralix*) (fig. 2) and Fine-leaved Heather (*E. cinerea*) (fig. 3) are common plants in most parts of Britain, and, like most of the genus, are very beautiful when in flower. The *heather-bells* of Scottish song are the flowers of one or both of these species. A sprig of *E. cinerea* was the badge of the Macdonalds at the time when they existed as a distinct clan. *E. carnea*, common in the southern parts of Europe, is a very frequent ornament of British flower-borders. Many species, remarkable for the size and beauty of their flowers, are much cultivated in greenhouses. Some of the south African or Cape heaths attain in their native region a much greater size than any European heath except *E. arborea*, which in the Pyrenees sometimes grows to the height of 20 feet. The so-called Briar-root (q.v.) of which tobacco-pipes are made is a heath.

In the Highlands of Scotland the common heath served in former times a great variety of purposes. The poorer folks formed walls for their cottages with alternate layers of heath and a kind of mortar made of earth and straw, and they made comfortable if not luxurious beds of it, placing the roots downwards, and laying the plants in a sloping direction. With heath cottages are also thatched, besoms are made, and faggots are formed to burn in ovens. In the island of Islay ale was made by brewing one part of malt with two of the young tops of the common heath, and this liquor, according to Boece, was used by the Picts. Sheep and goats sometimes browse on the tender shoots, but they do not like them. The young tops form almost exclusively the food of grouse. From the flowers bees extract a great quantity of honey, which is of a very deep colour.

Heathfield. GEORGE AUGUSTUS ELLIOTT, LORD, the heroic defender of Gibraltar, was the tenth son of Sir Gilbert Elliott, third Bart. of Stobs, and was born at Wells House in Roxburghshire, on Christmas-day 1717. Having been educated at the university of Leyden, and at the French military college of La Fère and at Woolwich, he had his first experience of actual warfare in the war of the Austrian succession, in which he was wounded at Dettingen and fought at Fontenoy. Having been gazetted colonel of a regiment of light horse in 1759, he served at its head with the English contingent that assisted Frederick the Great against Austria in the years 1759 to 1761. In the following year he went out to Cuba as second in command under the Earl of Albemarle, and returned home with the rank of lieutenant-general. When, after the outbreak of the war with the American colonies, Great Britain became involved in hostilities with Spain as well, Eliott was sent out to put Gibraltar in a state of defence. His obstinate and heroic defence of this stronghold, from June 1779 to February 1783, against all the power of Spain, ranks as one of the most memorable achievements of British arms (see GIBRALTAR). On his return home he was in 1787 raised to the peerage as Lord Heathfield, Baron of Gibraltar—Heathfield being a Sussex estate which he had purchased in 1763. He died at Aix-la-Chapelle, 6th July 1790. Drinkwater's *History of the Siege of Gibraltar* is one of the best accounts of military heroism ever written.

Heaven, in its theological sense, is that portion of the infinite space in which the Lord of all things, though present throughout all, is supposed to give more immediate manifestations of his glory. It is also the place, or the state or condition, of the blessed spirits, and of the souls of just men made perfect who are admitted into the participation or the contemplation of the divine beatitude. It is the special seat of the glory of the Most High, in which his angels minister to him, and the blessed spirits abide in perpetual praise and adoration. In the Scriptures the word is used in various senses: (1) for the region of the atmosphere; (2) sometimes for the region of the stars—the hosts of heaven; (3) as a state of blessedness attainable even here, as in Eph. ii. 6, where it is said 'God hath raised us up together (with Christ), and made us sit together in heavenly places;' and also in Phil. iii. 20, where the conversation of the saints while yet on earth is said to be 'in heaven;' (4) as the place where God dwells, where the angels and the spirits of the saints are congregated, whence Christ came and whither he has returned (John, xiv. 2, &c.). Many of the saints of Christendom in moments of ecstatic elevation of spirit have

believed that glimpses into heaven have been vouchsafed to them, but their accounts of these visions have usually been but incongruous and contradictory. The figurative language in which its unseen glories are described in Scripture has made such an excitation of fancy the more easy for devout souls rapt in profound meditation about what it has not been given to the eye of man to see nor the heart to conceive.

Aristotle declares that all men have a conception of gods, and that all agree in placing their habitation in the most elevated region of the universe. The Egyptian, the Scandinavian, the Assyrian, and all primitive religions maintain the existence of a heaven as the place of reward after death for virtuous lives lived on earth; and indeed it may be taken as the universal corollary to the universally held belief in the immortality of the soul, even though it may be only under the form of the final stage in a cycle of purificatory transmigrations. But among primitive peoples it is little more than a dim and shadowy continuation of this present world, the pale ghosts that inhabit it wearing the form and fashion that they wore in life. The idea of future retribution enters early into the moral consciousness of man, but it would hardly be true to say that it is everywhere present. The Teutonic warrior had his war-horse and his armour laid in his barrow that he might continue into the spirit world the joys of life, his Valhalla being but a glorified extension of the warrior's life, just as the Red Indian's paradise is but a richer and more extensive hunting-ground. Yet the unseen life is often but poor and cheerless compared with the warm and actual world—even in the Elysian fields the shade of Achilles would gladly change places with the meanest soldier in the Grecian host.

The Koran adopts the Cabbalistic notion of seven heavens, which rise above each other like the stages of a building; and it places the chief happiness of heaven in the unrestricted and inexhaustible joys of sense. The Cabbalistic writers divide these seven heavens according to the successive degrees of glory which they imply. The seventh is the abode of God and of the highest order of angels; the sixth, fifth, fourth, and third are the successive abodes of the various grades of angels, arranged according to the degrees of dignity. The second is the region of the clouds, and the first the space between the clouds and the earth.

For the development of Jewish and Christian Eschatology, and the significance of the conception of heaven, see the article HELL, under which the subject of future rewards and punishments is discussed with some fullness.

Hebbel, FRIEDRICH, lyrical and dramatic poet, was born at Wesselburen, in Dithmarsh, 18th March 1813. After travelling in Germany, France, and Italy, he settled at Vienna in 1846, where he married the actress Christine Enghaus. He died at Vienna, 13th December 1863. His principal works are his *Gedichte* (2 vols. 1841–48), and several dramas, the best among them being *Judith* (1840), *Maria Magdalena* (1844), *Agnes Bernauer* (1855), *Gyges und sein Ring* (1856), and his masterpiece, *Die Nibelungen* (1862). Hebbel had strong dramatic talent, skill in drawing character, and command of vigorous language, but no feeling for beauty. His dramas are destitute of love and joyousness; they depict the revolt of passionate natures, the frenzied riot of evil desires, and are characterised by an almost daemonic vigour of action. His collected works appeared in 12 vols. (Hamburg) in 1866–68. See Biographies by Kuh (1877) and Frankl (1884), and Hebbel's *Tagebücher* (2 vols. 1887).

Hebe, the goddess of youth, the daughter of Zeus and Hera, was the wife of Hercules after he had been deified. She was the cupbearer in Olympus, before Zeus conferred that office upon Ganymede; but she always retained the power of restoring the aged to the bloom of youth and beauty. According to Apollodorus, she became the mother of two sons by Hercules—Alexiares and Aniketos. In Homer she always appears as a virgin. In Athens altars were erected to her conjointly with Hercules. In Rome she was worshipped under the name of Juventas, and a temple in her honour existed on the Capitoline Hill at the time of Servius Tullius. Statues of Hebe are extremely rare; she is to be recognised only by the nectar-cup. All the world knows the masterpiece of Canova.

Heber, REGINALD, an English poet, and second Bishop of Calcutta, was born at Malpas, Cheshire, 21st April 1783. It was as a student of Brasenose College, Oxford, that he produced his prize poem *Palestine* (1803), the only prize poem perhaps which holds a place in English literature. In 1807 he was inducted into the family-living at Hodnet, in Shropshire. He was a frequent contributor to the *Quarterly Review*, his political views being those of a Tory and High Churchman, and in 1812 he published a volume of *Hymns*. He was appointed Bampton lecturer in 1815, a prebendary of St Asaph in 1817, and in 1822 was elected preacher of Lincoln's Inn. In the following January he accepted the see of Calcutta. The apostolic zeal with which he conducted his episcopacy was suddenly terminated by his death, of apoplexy, at Trichinopoly, on 3d April 1826. He was a voluminous writer, and published sermons, *A Journey through India*, &c., and he edited Jeremy Taylor's *Works* (1822). As a poet, his fame rests upon *Palestine* and his *Hymns* (new ed. 1878), which include such well-known favourites as 'Lord of Mercy and of Might,' 'From Greenland's Icy Mountains,' 'Holy, Holy, Holy, Lord God Almighty!' 'The Son of God goes forth to War,' &c. See Lives by his widow (1830) and G. Smith (1895). RICHARD HEBER, his half-brother, was born in Westminster in 1774, and died in 1833. He was a famous bibliomaniac. Dibdin estimated his collection in England at 105,000 vols., in addition to which he possessed many thousands of books on the Continent, the whole having cost him £150,000.

Hébert, JACQUES RENÉ, commonly known as *Père Duchesne*, one of the most despicable characters of the French Revolution, was born at Alençon, in 1755. At an early age he went to Paris as a servant, but was dismissed from more than one situation for embezzling money. Soon after the commencement of the Revolution he became one of the most prominent members of the extreme Jacobins; and when this group established *Le Père Duchesne* newspaper, for the purpose of crushing the constitutional paper edited by Lemaire and bearing the same title, Hébert was made editor of it. And he conducted his paper with such reckless ribaldry as to make himself a darling of the mob. In consequence of the events of the 10th August he became a member of the revolutionary council, and played a conspicuous part in the massacres of September. He was one of the commission appointed to examine Marie Antoinette, and his name will survive in unending infamy for one foul and baseless charge he brought against her. He and his associates, called Hébertists or *Enragés*, were mainly instrumental in converting the church of Notre Dame into a temple of Reason. But he went too fast for Robespierre, who got rid of him through the guillotine, 24th March 1794. His whining cowardice on the scaffold earned him the jeers and insults of the fickle mob.

Hebrew Language. The word Hebrew (*'ibrî*) is an adjective, formed, according to the Old Testament, from Heber (*'ébher*), a descendant of Shem (Gen. x. 22 24), who was the ancestor of Abraham (Gen. xi. 12-26). The Septuagint, however, already renders Gen. xiv. 13, 'Abraham the crosser' (i.e. of 'the river,' though Origen explains the name from 'crossing' Mesopotamia towards Canaan), and Aquila translates 'the dweller on the other side,' probably of the Euphrates, though it might be the Jordan. The word 'Hebrew' is used both of individuals and the people when antithesis to other nationalities is expressed (Jon. i. 9; Phil. iii. 5; Gen. xxxix. 14; xl. 15; Exod. i. 16; ii. 6, &c.), 'Israel' being more a domestic name, often having religious significance. As a national name, Israel belonged specially to the northern kingdom, of which it is used freely in the Moabite Inscription (e.g. lines 5, 11, 14).

The phrase 'Hebrew language' does not occur in the Old Testament. In the earliest reference to the speech (Isa. xix. 18) it is called the 'language of Canaan,' and in another passage, referring to events of the same period, 'Judean' or Jewish (2 Kings, xviii. 26, 28; Isa. xxxvi. 11, 13; cf. Neh. xiii. 24). This passage is interesting as showing the linguistic attainments of the Assyrian officials and others of this age. The Rabshakeh could speak Hebrew, and Hezekiah's officers understood Aramaic, which appears to have been the language of diplomacy and commerce at this time, a position to which it would naturally attain, from the fact that the Aramean peoples lay along the great trade routes between east and west. The name 'Hebrew' is first used of the language of the Old Testament in the prologue to Ecclesiasticus (c. 130 B.C.), and then in the New Testament (Rev. ix. 11). After the dissolution of the Jewish state Aramaic more and more made encroachment in Palestine, Dan. ii. 4–vii. 28, Ezra, iv. 8–vi. 18, and Jer. x. 11 being written in that dialect, to which also belong the words *Jegar-Sahadutha*, 'heap of witness' (Gen. xxxi. 47). Gradually it superseded Hebrew as the spoken language, and, though mixed with elements of Hebrew, was the dialect in use in the time of our Lord, as it had been for a long time previously. All the words reported as spoken by him (such as *talitha koumi* or *koum*, *lemâ shebaktâni*) are Aramaic. The name Hebrew was thus given to two languages, the ancient Hebrew, and the more modern Aramaic in actual use, though chiefly to the latter (John v. 2): 'their proper tongue,' to which Akeldama belongs (Acts, i. 19), is Aramaic. Which of the two languages is meant, Acts, xxi. 40, xxii. 2, xxvi. 14, may be doubtful.

The Hebrew language is one of the family of speeches since Eichhorn's time usually called Shemitic or Semitic, the peoples speaking them being in the main descendants of Shem. The family has four great divisions: (1) the Northern or Aramaic (Syriac or Eastern, and so-called Chaldee or Western Aramaic and Samaritan); (2) Middle or Hebrew (including Phœnician and Moabite); (3) Southern or Arabic (embracing Sabean or South Arabic, and Ethiopic); (4) To these must now be added an Eastern or Assyro-Babylonian division (see SEMITIC LANGUAGES). Hebrew shares with its sister-languages these and other peculiarities: roots with three consonants; vowels having no significance as stem-letters; two verbal forms for the expression of tense; two genders; the attachment of the oblique cases of personal pronouns to nouns and verbs in the form of suffixes; an inability, except in proper names, to form compounds, whether verbal or nominal; and a syntax distinguished by simple co-ordination of clauses by means of *and*, where other languages subordinate with a multiplicity of conjunctions. At a remote period we must suppose primitive Semitic spoken by a united, homogeneous people, which afterwards separated in various directions, each section retaining and developing some of the originally common elements of the tongue, until gradually, under many influences of climate and conditions of life, the great dialects acquired distinctness from one another. In this way some primitive elements would be retained by one family and others by another, while each would move along new lines of development, due to its idiosyncracies and circumstances, as Hebrew, for example, expresses 'west' by 'sea.' Even in the earliest form in which we observe Hebrew it shows marks of linguistic decadence. It has almost entirely renounced nominal case-endings; given up the use of the dual, except in a few nouns; is in process of substituting the reflexive for the passive (a process completed in Aramaic and Ethiopic); and has lost the consciousness of the strict sense of its elementary moods. In short, literary Hebrew is already nearly at the same level as vulgar Arabic, as distinguished from inflected Arabic, or as modern English is compared with Anglo-Saxon. On the other hand it has some peculiar excellences, as the greater freedom in regard to the place of words in the sentence, and the singular tense usage known as *vav conversive*, of which, however, it is now known to have no monopoly, but to share it with the language of Moab.

Beyond differences of pronunciation and usages peculiar to separate localities, 'dialects' can hardly have existed in Hebrew. In the north a shorter form of the relative appears, *she* or *sha* (Ass. *sha*)—e.g. Judges, v. 7. This is common in the Canticles (of disputed date), and in later books, as Ecclesiastes, and usual in post-biblical Hebrew. The Ephraimites appear to have shared the usual Shemitic tendency to confuse *sh* and *s* (Judges, xii. 6); and in the south Amos (vi. 8; viii. 8) shows another common failing, that of confusing the gutturals, a thing said to have gone to an extreme in Galilee in the age of Christ, and abundantly exemplified in Assyrian. So far as the literature of the language is concerned, only two periods can be distinguished: (1) from the earliest times to the restoration from exile (538), and (2) from the restoration to our era (see BIBLE). It is true that writers on the borders of the exile, such as Jeremiah and Ezekiel, show a tendency to employ Aramaic words and forms; but, on the other hand, writings of the exile period, as Isa. xl.–lxvi. and much else, are splendid examples of Hebrew composition. The restored community in Judah would of course still speak and write Hebrew. In the north of the country, however, the policy of Assyria had long ago settled a number of colonists, speaking mainly Aramaic. When Palestine came under the influence of the Syro-Greek kingdom the Aramaic pressure would become greater. And thus gradually Hebrew receded before the Aramaic, until by the time of the Maccabees, or considerably earlier, the latter had become the spoken language. Among the learned, however, the ancient tongue was still cultivated and written, though naturally not in its ancient purity, nor without many new developments. These new elements are of several kinds: first, nominal and verbal forms, partly absolutely novel, but mostly a great extension of forms occurring rarely in the classical language; and secondly, a considerably altered vocabulary, drawn partly perhaps from a lower stratum of popular speech than that touched by the biblical writers, but greatly from the Aramaic. Examples of this new literary, though degenerate, Hebrew may be seen in its earliest form in Ecclesiastes,

and in a much more advanced condition in the Mishna (c. 200 A.D.).

The character in which Hebrew was written was the ancient Semitic alphabet, common over much of the East, the origin of which is traced by some to Egyptian hieroglyphs, and by others to different sources (see ALPHABET). The oldest and most beautiful example of this character is the Moabite Inscription (c. 900 B.C.; see MOAB); a somewhat ruder form appears in the inscription from the Siloam tunnel, probably of the age of Ahaz or Hezekiah (740–700 B.C.; found in 1880; see *Proc. Soc. Bib. Archæol.* 1882). The latter was executed at their own hand by the workmen who cut the tunnel, and is naturally less artistic, though extremely interesting, as showing how extended the art of writing was at so early a time (Isa. x. 19). In the Moabite monument the same letter appears in several forms, which suggests either great practice on the part of the sculptor, or else that he faithfully copied a model supplied him by the pen, in this case a facile one. The character appears in a bigger, more robust form in the Phœnician inscriptions—e.g. of Eshmunazar. Somewhat modified it is Samaritan; in south Arabia it is Himyaritic or Sabean; and from there it passed to Abyssinia, and is Ethiopic. The Syriac and Arabic are the same letter in cursive forms. The Aramean influence on southern Palestine introduced not only its dialect but also its script. The present Hebrew square character is in a somewhat ornamental shape—a cursive form of the ancient alphabet adopted by the Arameans; the article ALPHABET shows both the Phœnician and the later square Hebrew character. The monuments show this Aramean cursive in various forms of development. Jewish tradition ascribes its introduction to Ezra, a tradition which expresses merely the facts that a change took place in the letter employed, and that this change was posterior to the return from exile. The use of the letter no doubt crept in gradually, just as the use of the Aramaic dialect did. The ancient letter is still seen on coins of the later Maccabean princes. Some deviations of the Septuagint from our present Hebrew text seem explainable from the supposition that their MSS. were written in the ancient character; while, on the other hand, some discrepancies rather suggest MSS. in the square letter. The words of Christ, 'one jot or tittle,' have been thought to show that the square character, in which *y* (י or *yod*) is much the smallest letter of the alphabet, had long been in use.

The history of the language would not be complete without one or two additional facts. (1) In Semitic languages the consonants alone are usually written. Of course, no language could be spoken, and no writing read without vowel-sounds, but no signs for these sounds existed. Certain weak consonants, however—viz. *h*, *w*, *y*, were early used to indicate the place of long vowels, particularly at the end of words, and also of diphthongal sounds (*ai* = *ê*, *au* = *ô*) in the middle of words. Already in the Moabite stone final vowels are so marked, and occasionally diphthongs within words. Phœnician, on the contrary, uses such signs very little. Ancient Hebrew agreed with Moabite in its practice, as appears from the Siloam inscription. The use of these so-called vowel-letters was probably scanty and fluctuating in early times, but became more regular afterwards. Unfortunately, we have no guarantee that transcribers were careful to preserve the antique spelling. Our present text is too uniform to be supposed to have preserved the varieties of different ages, and it is evident that the MSS. of the Septuagint translators in a multitude of cases were without the medial vowels, and in some cases without the final vowels, now present in the Hebrew text. In the end of the 1st or early in the 2d century a standard text was adopted, and modernising of the spelling in the main ceased. Peculiarities were henceforth registered, not effaced. This period during which the consonantal text was treated extends to the era of the Talmud (c. 500 A.D.). During its course a multitude of works were produced—e.g. *Midrashim*, or homiletical expositions, especially of the books of the Pentateuch; the Mishna (200 A.D.), a code of traditional law; and the tracts composing the Talmud, which are commentaries on the Mishnic law, but containing much haggadic or edifying matter. (2) Neither Jerome (d. 420) nor the Talmud knows anything but the consonantal text. The example of Syrian scholars and necessity led, however, to the invention of a very complete system of external signs for the vowel-sounds of the language. This is the Massoretic system of points, now printed in our Bibles. Its authors are unknown, and also the age at which it was completed. Minute as it is, it can make little pretension to represent the pronunciation of the ancient living language. The pronunciation of a language during a period of nearly a thousand years in disuse must have undergone changes; the Septuagint pronounces in many cases differently from the present text; and, in point of fact, the vocalisation represents not the pronunciation of a spoken language, but that of the solemn intoned reading in the service of the synagogue.

About the 10th century a new impulse was given to the study of Hebrew by the example of the Arabic grammarians. The interest of the latter was to begin with a purely religious one—i.e. to explain the Koran. Even the earliest collections of poetry had this religious object. The poetry of the desert was accepted as the purest Arabic, and it was collected and studied with the view of illustrating the syntax of the Koran. By-and-by grammar came to be cultivated for its own sake, and the ancient poetry studied for the sake of its intrinsic charms. In emulation of their Arabic confrères, a school of Hebrew grammarians arose, to which belong such names as Saadia of the Fayyum, Chayyuj (1000), Abu'l-Walid Merwan ibn Janach, Abenezra (d. 1167), Dav. Kimchi (d. 1235). Where Arabic was not used a neo-Hebraic language was employed by these scholars, greatly a return to biblical Hebrew, and in this many commentaries were composed, as by Abenezra, Kimchi, and Rashi of Troyes (d. 1105). At the revival of letters Christian scholars became apt pupils of the Jews—e.g. John Reuchlin (d. 1522). In the next century the chief seat of Hebrew learning was Switzerland, where flourished Buxtorf the Elder (d. 1629); and in the century following Holland, the most famous representative of the Dutch school being Alb. Schultens. In the 19th century the most distinguished promoters of Hebrew learning have been Gesenius of Halle and Ewald of Göttingen.

The following is Gen. i. 1–3 in Hebrew:

בְּרֵאשִׁית בָּרָא אֱלֹהִים אֵת הַשָּׁמַיִם וְאֵת הָאָרֶץ׃
וְהָאָרֶץ הָיְתָה תֹהוּ וָבֹהוּ וְחֹשֶׁךְ עַל־פְּנֵי תְהוֹם וְרוּחַ
אֱלֹהִים מְרַחֶפֶת עַל־פְּנֵי הַמָּיִם׃ וַיֹּאמֶר אֱלֹהִים יְהִי־אוֹר
וַיְהִי־אוֹר׃

See Gesenius, *Gesch. der Heb. Sprache* (1815); Renan, *Hist. Gén. des Langues Sémitiques* (4th ed. 1863).

MODERN HEBREW.—A few observations may be added, in conclusion, on the use of Hebrew as a spoken and written language among modern Jews. Hebrew has continued down to the present day as the language of the synagogue. Except in the Reform communities of Germany and America, public and even private worship is

almost entirely conducted in 'the sacred tongue.' Although the majority of western Jews, particularly among the upper and middle classes, possess but an imperfect acquaintance with it, the authorities manifest a strong disinclination to cease praying in a language which, it is urged, constitutes a powerful link between Israel's present and past, and serves as a bond of union between Jews all the world over. Outside the synagogue, Hebrew can scarcely be said to have survived as a *spoken* language, except that in Jerusalem and other eastern cities it forms a sort of *Lingua Franca* among the Jews of various nationalities settled there. As a *written* and *printed* language, however, the employment of Hebrew is far more general. It serves as a universal medium of correspondence, both private and official, among Jews in various parts of the world, and particularly between the East and the West. Various weekly journals are also written in it, in Europe as well as in Palestine. Added to this, numerous Hebrew works on all subjects continue to be composed by learned Jews. The Hebrew thus used for modern purposes is usually not the pure Hebrew of the Bible and synagogue, but the rabbinical dialect in which Jewish doctors of the law have studied and commented, written and disputed since the age of the Mishna, and which has been developed and amplified by Jewish philosophers, poets, and grammarians throughout the middle ages. Both kinds of Hebrew—biblical and rabbinical—must be carefully distinguished from the *patois* dialects affected by Jews in countries where they have not yet been fully emancipated or modernised. In Russia and the adjacent parts of Germany and Austria they speak a jargon composed of Hebrew and corrupt German, called *Jüdisch-Deutsch*, while in parts of the East a Judæo-Spanish dialect flourishes by its side. The pronunciation of Hebrew differs among the two geographical sections into which Jews are divided, and which are known as *Ashkenazim* or 'Germans,' and *Sephardim* or 'Portuguese,' the former being of German and Polish origin, and the latter having migrated from the south of Europe or being still distributed there. The origin of this difference is not exactly known, but it may be assumed that the 'Portuguese' mode of reading originally came from Palestine, where the vocalisation and pronunciation of Hebrew were fixed by the Massorites of Tiberias, and that the German Hebrew originated in the academies of Babylon under the influence of the Eastern-Syrian grammarians. The Sephardic system is hence supposed to be purer than the Ashkenazic.

Hebrews. EPISTLE TO THE. The title of the epistle in the earliest MSS. is simply 'To Hebrews.' This title is probably not from the hand of the writer, but due to some copyist who embodied the writing among others. The term 'Hebrews' is a national title given to all those descended from Abraham, in opposition to Gentiles or Greeks (2 Cor. xi. 22; Phil. iii. 5; cf. Heb. ii. 16); or in a narrower sense it is applied to Jews still speaking a Semitic language, in opposition to Hellenists or Greek-speaking Jews (Acts, vi. 1). It is probably used in the more general sense here, and the title merely suggests, what is evident, that the epistle was addressed to persons of Jewish descent. The opinion that the letter was addressed to Hebrews in general, wherever they might be, cannot well be maintained, owing to the many local and personal references, and the details of history given by the author. He hoped to see the Hebrews soon, as he had been with them before (xiii. 19, 23). In their earlier history they had suffered persecution and the spoiling of their goods (x. 32), some of them had been or were in bonds (xiii. 3, x. 34), although their afflictions had not yet gone so far as martyrdom (xii. 4), unless it may be that some of those having the rule over them had so suffered (xiii. 7). Their circumstances and the lapse of time, and probably also the disappointment of their hopes of the coming again of Christ (x. 37), had not been without a wearing effect upon them; their Christian enthusiasm had grown cold (x. 25), and they had not advanced, or rather had fallen back, in their Christian knowledge and experience (v. 11–14); and though distinguished by liberality to their poorer brethren, as they had always been (vi. 10), they were wavering in their faith, and in danger of falling away from it (ii. 1–3, iii. 12, vi. 4, x. 25–29); they had need of patient endurance (x. 36, xii. 1 *et seq.*) and fear lest any of them should seem to come short of the rest of God (iv. 1, xii. 15). Terrible warnings are uttered by the author in regard to the sin of apostasy and the impossibility of recovering to the faith those who fall away after being enlightened (vi. 4–8, x. 26–31, xii. 15–17), although that for which they were in danger of renouncing their Christian faith is nowhere distinctly stated. From the general drift of the epistle, however, it may be inferred that what the author feared was a relapse into Judaism, and hence he exhorts them to break conclusively with the old dispensation and go forth without the camp (xiii. 9–14).

The question of the locality where persons having such a history and living in such circumstances must be sought has been very differently answered. The traditional view has been, under the assumption of the Pauline authorship of the epistle, that the church in Jerusalem was addressed. And perhaps this is still the prevailing opinion. There are, however, serious obstacles in the way of this opinion. The church in Jerusalem must have still contained many who had seen and heard the Lord, while those here addressed had only been evangelised by those who heard him (ii. 3). Such facts as these: that the epistle is in Greek, and by a writer who knows the Scriptures only in Greek, and who, though hardly a native of Palestine, stands in such relations to the Hebrews as he does; that they are interested in Timothy, the devoted minister of St Paul (xiii. 23); that the church, so far from being poor, is able to minister to the necessities of the saints (vi. 10); and that the author seems to count upon the sympathy of his readers with his advanced views—these facts are rather against Jerusalem. On the other hand, the idea that the Hebrews must have been exposed to the seductions of an imposing ritual, which could only be the Temple service, has little support in the epistle. The author's references to the Old Testament ritual are purely theoretical, and have no bearing on the existing practices; he reasons entirely on the written scripture, on Judaism as founded by Moses, and his arguments would be understood by Jews everywhere, as the system of thought and the feelings against which he directs them were common to them in all places. Others have thought of Alexandria. The author is certainly a man of Alexandrian culture, and the line of thought he pursues would be very natural if addressed to Alexandrian Jews. It is almost a fatal objection to this view, however, that, though the epistle was early known and highly valued in the church of Alexandria, not a trace of a tradition appears that they were the recipients of it. Clement believed that the epistle was written in Hebrew, and addressed to Jerusalem by St Paul. In modern times some have advocated the claims of Rome. The first references to the epistle are found in the letter of the Roman Clement to the Corinthians (*c.* 96 A.D.). The consistent tradition in Rome, too, is that the epistle is not by St Paul; and the reference to Timothy, and to those of Italy (xiii. 24) would, on this view, find a natural explanation, and also, perhaps, some remarkable coincidences between the epistle and that

to the Romans. The Church of Rome, however, must have always been greatly Gentile, and references like xiii. 7, 17 preclude the idea that a Jewish section of a church was addressed.

The authorship of the epistle is involved in equal obscurity. In the earliest times opinion was divided. In Rome and the West the consistent tradition is that the epistle is not Pauline. In Africa Tertullian refers to it as by Barnabas (*De Pudic.*, c. 20). In Alexandria and the East, on the other hand, it is regarded as Pauline, either immediately, or mediately through a translator (Clement), or some one who had given the Pauline thoughts form and expression (Origen). Augustine gave in to the Alexandrian view, and since his time the Pauline authorship was accepted in the West. At the Reformation Luther suggested Apollos as the author; and Calvin either Luke or Clement of Rome. Modern scholarship is virtually unanimous in the opinion that the epistle is not from the hand of St Paul. This view is based on many things, as upon the language, which is purer Greek than any other New Testament writing; upon the rhetorical, rhythmical, and flowing style, and the carefully planned and systematic form of the treatise, which has none of the abruptness and sudden transitions characteristic of the Pauline writings; upon the fact that the author appears to be ignorant of Hebrew, quoting always the Septuagint, and basing his reasoning on its renderings, even when it deviates from the Hebrew; upon the different formulas employed in citing Scripture; and particularly upon the author's system of thought, which reflects Alexandrian Jewish philosophy in some places, and which, though reaching the same conclusion with St Paul that Christianity has fulfilled and superseded the old economy, reaches it by a different road. The place of St Paul's circle of legal ideas—guilt, satisfaction, imputation, justification by faith—is taken by a circle of ideas having reference to worship of God: sin is uncleanness hindering the sinner from drawing nigh to God; the blood of Christ purifies the conscience so as to serve the living God (ix. 14); hence redemption is conceived as the work of a perfect High-priest. Faith is generalised into a realising of the unseen (chap. xi.); and the Spirit does not appear to occupy the place he has in the Pauline writings as the source of the new Christian life. Modern scholarship has not succeeded in suggesting any new name as author of the epistle, opinions being divided in favour of Apollos, Barnabas, Clement, Luke, and Silas.

It has been thought that if Jerusalem had fallen before the author wrote he would certainly have used this fact to support his teaching that Judaism had been transfigured into Christianity, and consequently that the epistle dates before 70 A.D., probably about the beginning of the Jewish war (67 A.D.). It must be acknowledged that owing to the author's theoretical method of reasoning on Judaism, which would apply to it whether the temple and ritual remained or not, this argument is not very strong, and others prefer a later date. The epistle is largely used in Clement's Epistle, which is usually assigned to about 96 A.D.

The persons to whom the epistle is addressed being such as above described, its theme is, the finality of Christianity as a religion. This finality is shown by a continuous contrast with Judaism. The contrast has three main steps, which move, so to speak, backwards or inwards, accompanied always by earnest exhortation. (1) Chap. i.–ii., Christ, the Son, exalted because of death to be head of the new world of redemption. Contrast with angels. (2) Chap. iii.–iv. 13, Christ, the Son, the faithful leader into the rest of God. Contrast with Moses and Joshua. (3) Chap. iv. 14–x. 18, Jesus, the Son of God, the heavenly High-priest, and true sacrifice. Contrast with Aaron, with the earthly tabernacle, and with the sacrifices of bulls and goats. On this follows a splendid passage of exhortation (chap. x. 19–xii. 29) on the application and personal appropriation of the truths just taught. And finally (chap. xiii.), a more personal conclusion.

Hebrews, Gospel of the. See Apocrypha.

Hebrides, or Western Islands, the name applied in a general sense to all the islands on the west coast of Scotland. To the Outer Hebrides, the geological substratum of which is almost exclusively gneiss, belong Lewis with Harris (Long Island), North Uist, Benbecula, South Uist, Barra, and the remote group of St Kilda, 60 miles to the west. The principal of the Inner Islands, composed chiefly of trap and slate, are Skye, Eigg, Coll, Tiree, Mull, Iona, Staffa, Ulva, Lismore, Kerrera, Colonsay, Oronsay, Jura, and Islay. Bute, the Cumbraes, and Arran, are usually counted amongst the Hebrides; and to the same group were anciently assigned the peninsula of Kintyre, the island of Rathlin, and the Isle of Man. The total number of islands of any size is about 500, but of these only one-fifth are inhabited. The population was 100,021 in 1881. Of the whole surface only about 200,000 acres are arable; the rest is pasture-land of little value, morasses, peat-mosses, lakes, and barren sands and rocks. Owing to the influence of the Gulf Stream, the Hebrides have a mild though humid climate. Politically the Hebridean isles are distributed among the Scottish counties of Ross, Inverness, Argyll, and Bute. The humbler class of natives for the most part speak Gaelic. The people are much occupied in fishing and fowling (see Crofters). A large proportion of the area has been converted into sheep-walks, whilst extensive tracts are let to sportsmen.

The Hebrides are the *Ebŭdæ* of Ptolemy and Pliny's *Hebŭdes* (of which 'Hebrides' is a corruption, due originally to a misprint), and *Sudreyjar* (Southern Islands) of the Norwegians. This last name was Latinised as Sodorenses, which survives in the title 'Bishop of Sodor and Man.' The early Celtic inhabitants were converted to Christianity by St Columba in the 6th century. Some three centuries later several of the islands were colonised by Norwegians, who came hither to escape the iron rule of Harold Haarfager (q.v.). But in consequence of the severe depredations which these sea-rovers afterwards committed on the coast of Norway, Harold sent an expedition westwards, which subdued all the Western Islands as far south as Man. To Norway they remained subject till 1266, when they were transferred to Scotland. From that time the islands were governed by native chiefs, until in 1346 the head of the Macdonalds reduced the whole under his authority, and took the title of Lord of the Isles (q.v.). But from the beginning of the 16th century they were gradually annexed to the Scottish crown. In the 19th century the Hebrides have become widely known through Scott's poem *The Lord of the Isles* and Mr William Black's charming novels.

The more important works on the Hebrides are Martin's *Description* (1703); Pennant's *Tour* (1774); Dr

Johnson's *Journey* (1775); Gregory's *History* (1836); Macculloch's *Description* (1819); Buchanan's *Hebrid Isles* (1883); and Gordon-Cumming's *In the Hebrides* (1883).

Hebrides, New. See New Hebrides.

Hebron, one of the oldest cities in Palestine, belonging to the tribe of Judah, 21 miles SSW. of Jerusalem. It was anciently called Kirjatharba, and at a later period was the seven years' residence of King David before he conquered Jerusalem. The modern town, El Khalîl ('the friend'—of God, Abraham), is a poor place, inhabited by some 10,000 people. It lies low down in a narrow and picturesque valley—the Valley of Eshcol, famous now, as of old, for its thick clustering grapes, its olives, and other fruits. The church erected by the Empress Helena, the mother of Constantine, on the spot where Abraham is said to have been buried, has been converted into a mosque called *El-Haram* ('sanctuary'), built to enclose the cave which is the traditional burial-place of Abraham, Isaac, and Jacob and their wives. See an article by Conder in the *Palestine Exploration Quarterly*, October 1882.

Hecatæus of Miletus, an early Greek historian and geographer, usually styled 'the logographer,' flourished most probably about 500 B.C. He seems to have visited Greece, Thrace, the countries bordering on the Euxine, and many of the provinces of the Persian empire, with parts of Italy, Spain, and Africa, and the results of his observations were given in two great works—his *Tour of the World*, and his *Histories* or *Genealogies;* the latter, however, is little more than a prose version of the poetical legends of the Greeks. Only fragments now remain, which have been edited by Creuzer, Klausen, and Müller. At the revolt of the Ionians against Persia he dissuaded its ringleader, Aristagoras, from an attempt so far above the means of his countrymen; and when that counsel was despised, urged the formation of a fleet, but in vain. Hecatæus afterwards went as ambassador to the Persian satrap Artaphernes, and induced him to treat the Ionians with leniency.

Hec'atē, a mysterious goddess who was apparently unknown to the Greeks of Homeric times and may be of oriental origin. She makes her first appearance in Hesiod as a goddess having power over earth, heaven, and sea. This triple power may perhaps give the clue to the fact that in art she is occasionally represented as a triple figure. It also explains the fact that ultimately, and especially in Orphic literature, she came to be identified with many other goddesses, such as Artemis, Eileithyia, Selene, Iris, Persephone, Aphrodite, Gaia, Hestia, Isis, Physis, and the Bona Dea. Owing to the extent of her domain she was especially able to grant the wishes of her votaries and to give them the fulfilment of their desire in battle, in athletic and other contests, in the popular assembly, and in the law-courts. But her power was above all displayed in the matter of ghosts and bogeys; she was able not only to ward off the visits of such hags but also to send them. Indeed, besides sending an Empusa or an Antæa, she also herself appeared as a bogey, with torch and sword, and snakes for hair; or she might appear as a dog, a mare, a lioness, or a cow. As her appearance was the sign for dogs to bark, so she was supposed to be accompanied by a train of Stygian dogs. The origin of this figure is uncertain; she is claimed as a moon goddess, and her name is interpreted in accordance with this view as indicating the action of light at a distance. It makes against this theory, however, that the lunar functions of Hecate are not mentioned by any author earlier than Sophocles, and that they do not become prominent in her worship until post-classical times, and then only 'in the systems of the later mythologists' (see *Class. Rev.* June 1888). Her intimate connection with the spirits of the dead would rather point to her having originally been a goddess of the nether world, for the earth is regarded as the abode of the spirits of the departed. This would explain her connection with the mysteries, and the propitiatory offerings made to her in atonement for sin. Finally, the unsatisfactory explanation of her name just given may be safely set aside, as too abstract, in favour of the interpretation of the name as meaning 'dog' (Hecate : Ger. *hund* : Eng. *hound* : : Gr. *hekaton* : *Hund*-red. See *Class. Rev.* Nov. 1889). This harmonises with various points in the ritual of Hecate; dogs were offered to her at cross-ways (which are favourite haunts for ghosts), she herself is termed fond of dogs, and sometimes appeared leading Cerberus.

Hecatomb, in the worship of the Greeks, and in other ancient religions, a sacrifice of a large number of victims, properly, although by no means necessarily, one hundred. As early as the time of Homer it was usual only to burn the legs wrapped up in the fat and certain parts of the intestines, the rest of the victim being eaten at the festive meal after the sacrifice. In Athens the hecatomb was a most popular form of sacrifice; while the thrifty Spartans on the contrary limited the number both of the victims and of the sacrifices. In the hecatomb, strictly so called, the sacrifice was supposed to consist of one hundred bulls; but other animals were frequently substituted.

Hecker, Friedrich Karl Franz, a leader of the democratic party in the German revolution of 1848, was born at Eichtersheim, Baden, September 28, 1811. After studying law in Heidelberg, he became in 1838 advocate of the supreme court in Mannheim. But in 1842 he abandoned his profession for political life, joining the democratic and socialistic party, of which he speedily became one of the recognised heads. On the outbreak of the revolution in 1848 he endeavoured to convert the preliminary convention (*Das Vorparlament*) into a permanent republican assembly. But, frustrated in this attempt, he put himself at the head of a band of revolutionists, and invaded Baden from the south; he was, however, defeated at Kandern (20th April), and fled to Switzerland. In the following year he settled in America as a farmer near Belleville, in Illinois. On the outbreak of the civil war he raised a regiment of Germans, and afterwards for a time commanded a brigade. He died at St Louis, 24th March 1881.

Hecker, Justus Friedrich Karl, medical author, was born 5th January 1795, and became professor of Medicine at Berlin. He died 11th May 1850. Among his writings are a history of medicine (1829), books on the Black Death, &c., and the great work, the *Epidemics of the Middle Ages* (trans. for Sydenham Society, 1846).

Heckles (Mid. Eng. *hekele*, from the Dutch *hekel*, *haak*, 'a hook;' cf. Ger. *haken;* another English form is *hackle*) are very important parts of various machines employed in the preparation of animal and vegetable fibres for spinning. They consist of a series of long metallic teeth, through which the material is drawn, so that the fibres may be combed out straight and so fitted for the subsequent operations. Gills are heckles with finer teeth (see Spinning).—*Heckling* is also now the received term (first used in Scotland) for the rough and trying process of catechisation to which parliamentary candidates and members are subjected by their constituencies.

Heckmondwike, a market-town in the West Riding of Yorkshire, 8 miles NE. of Huddersfield.

It is the chief seat of the carpet and blanket manufactures in the West Riding, and also makes rugs, pilot-cloth, and fustians. There are ironworks, machine shops, and coal mines in the neighbourhood. Here was born John Curwen, the inventor of the Tonic Sol-fa system. Pop. (1851) 4540; (1891) 9709.

Hecla, or HEKLA, a volcanic mountain in Iceland, stands isolated about 20 miles from the south-west coast and 68 miles E. from Reykjavik. Its snow-clad summit is 5102 feet high, and has five craters. The sides of the mountain are seamed by numerous deep ravines. The principal rocks are lava and tuff. 'Fantastic groups of hills, craters, and lava, leading the eye to distant snow-covered jokuls; the mist rising from a waterfall; lakes embosomed amid bare bleak mountains; an awful and profound slumber; lowering clouds; marks all around of the furious action of the most destructive of the elements, give to the region a character of desolation scarcely to be paralleled.' A record of the eruptions has been kept since the 9th century, during which time there have been eighteen outbreaks. These have generally been very violent, and have often continued for a considerable time. In September 1845 a terrific outbreak occurred and lasted for more than a year. A fine dust from this eruption was scattered over the Orkney Islands, a distance of 500 miles from Hecla. Indeed, the great quantities of fine dust ejected, and the immense distances to which it has been carried, have generally been noted as characteristic of the Icelandic eruptions.

Hectare. See ARE.

Hectic Fever (Gr. *hektikos*, 'habitual;' see FEVER) is the name given to the fever which occurs in connection with certain wasting diseases of long duration. It is one of the most serious and constant symptoms of Consumption (q.v.), and seems to be directly related to the progressive emaciation which marks the course of that malady. In the morning the patient's temperature may be normal. He may even feel chilly. But towards evening or after eating he grows hot and flushed; and there is a preternatural vividness of expression, which, with the heightened colour, sometimes gives a very fallacious impression of health. The patient retires to bed, has tossing and uneasy sleep, and wakens in the middle of the night, or towards early morning, bathed in cold perspiration, and in a state of extreme languor. The same exhausting cycle repeats itself day after day. The only radical way of treating the fever is to cure the disease on which it depends. When the symptom itself must be combated, a pill containing a grain of sulphate of quinine, with half a grain of digitalis and as much of Dover's powder, taken three times a day, is often serviceable.

Hector, the eldest son of King Priam and Hecuba, husband of Andromache, and father of Astyanax (Scamandrius), appears in Homer's *Iliad* as the ideal of a warlike hero, brave to the last degree, yet faithful and tender alike as husband, father, and son. One of the noblest passages in the *Iliad* describes his parting with Andromache. He holds the same rank among the Trojans as Achilles among the Greeks, and, after bearing the main burden of the war, falls at length by the hand of Achilles enraged at the death of his beloved companion Patroclus. His body was dragged in triumph by the conqueror round the tomb of Patroclus, but was afterwards ransomed by Priam, who caused it to be burned with great pomp.

Hecuba (Gr. *Hekabe*), the second wife of Priam, king of Troy. During the Trojan war she witnessed the destruction of all her sons, with the exception of Helenus, and at last saw her husband murdered before her eyes by the savage Pyrrhus. After the destruction of Troy she fell into the hands of the Greeks as a slave, and, according to one form of the legend, threw herself in despair into the sea. Euripides (in his tragedy of *Hecabe*) and other ancient tragedians describe her as a tender mother, a noble princess, and a virtuous wife, exposed by fate to the most cruel sufferings.

Heddles. See WEAVING.

Hedge (A.S. *hege*, another form of *haga*, whence modern *haw*; cf. Ger. *hag*. The Fr. *haie* is of Teutonic origin), a living or growing fence, in contradistinction to wall, paling, &c., used for the purposes of enclosure, shelter, and ornament in connection with agriculture, forestry, and gardening. Hedges are very much used in some parts of the world, whilst others, equally cultivated, are almost destitute of them. Thus, whilst they are very common in many parts of Britain, they are comparatively rare in France and Germany, as well as in America. They are formed of many kinds of trees and shrubs according to the purpose in view, the nature of the exposure, the elevation of the site, and the soil in which they are to be planted. It is essential, whatever plant may be used, that it should bear without injury the degree of annual pruning necessary to keep it trim and within the proper limits of a fence.

For the purposes of agriculture and forestry Hawthorn (q.v.) is almost universally employed in Britain wherever the conditions of soil and situation are favourable to its growth. When properly attended to, especially in respect of annual pruning, it is the most effectual fence for domestic animals, and also an excellent shelter. On elevated sites, those exceeding 1000 feet above sea-level, it does not succeed well. In such positions elder, mountain ash, &c. are planted for shelter in the form of hedges, but are deficient in the other qualities of a fence. Beech-hedges are familiar in some districts. Substitutes for hawthorn in providing shelter by the seaside are found in sea-buckthorn, snowberry, scarlet dogwood, sloe, wild-pear, &c., but none of them are of value in repelling cattle. Ornamental hedges are formed of holly, yew—the latter is regarded as poisonous when eaten by cattle, horses especially, and should therefore be selected only for positions which they cannot approach—arbor vitæ, laurel, privet, barberry, both evergreen and deciduous; beech, hornbeam, &c. In some parts of the west of Scotland and Wales, and in the south of England and many parts of the coast of Ireland, permanent hedges of fuchsia, arbutus, and other beautiful evergreen or flowering shrubs are to be found, though they will not endure the cold of inland and east coast districts in the same latitudes.

In the United States the English hawthorn is useless as a hedge-plant, as the foliage is late, is destroyed by the heat, and is much infested by insects; the native thorns are little better. In various parts of the states where hedges are employed serviceable plants are bodock (see BOIS D'ARC), honey locust, pyricanth, the Macartney rose, buckthorn, barberry, &c.

Hedges were in use among the ancient Romans, chiefly for the enclosure of vineyards and gardens. It is probable that they have existed in England since the times of the Romans, although not very common till the end of the 17th century; but they are supposed to have been first introduced into Scotland and Ireland by the officers of Cromwell's armies.

Hedgebote, an old word for the right of a tenant to cut wood on the farm or land for repairing the hedges or fences.

Hedgehog, the European representative of the genus Erinaceus, the type of the family Erinaceidæ, order Insectivora (q.v.). The chief characteristics of the genus are: body capable of being rolled up into a ball by the action of a powerful muscle arising from the head and neck on either side, and forming a loop around the posterior extremity; ears distinct; teeth, three incisors on each side in either jaw, the central pair long and prominent, molars, seven on each side above, five below, with rounded tubercles; zygomatic arch of the skull complete; legs short, with five toes on each foot; the two leg bones ankylosed; tail short; back covered with spines, the remainder of the body with hairs and bristles.

There are fourteen species, none of which occur in the New World or Australia. The Common Hedgehog (*Erinaceus europæus*) has a sharply pointed muzzle and ears less than half the length of the head. The eyes are small and black. The animal is at most about a foot long, and some six inches high. The spines which cover its back attain a maximum length of about an inch; they are sharply pointed and remarkably firm and elastic, so much so that they constitute a cushion upon which the animal will allow himself to fall from a considerable height with impunity. They are finely grooved along the sides, and have a pin head-like root so attached to the muscle of the back that when the latter contracts they radiate outwards in all directions.

Common Hedgehog (*Erinaceus europæus*).

The animal eats small vertebrates, such as mice, young birds, and frogs, insects, worms, and sometimes vegetable matters. It is very useful in a garden or in a house infested by cockroaches. It has even been known to attack and devour snakes, seeming to have some special power of resisting not only the poison of the viper, but also other noxious substances. It is nocturnal in its habits, and hibernates throughout the winter, and, according to the Gypsies, with whom it is a special delicacy, it does store up birds, mice, crab-apples, &c. It inhabits hollows of trees or crevices in the rocks, but in default of these will excavate itself a burrow. The pairing season is from the end of March to the beginning of June; and the period of gestation is seven weeks. Three to six (rarely eight) young are born at once; they have both the eyes and ears closed. The spines are at first quite white and soft, and since they point backwards and the young are born head first there is no risk of injury to the mother during parturition.

Its area of distribution extends over the whole of temperate Europe and the greater part of Asia north of the Himalayas. Fossil hedgehogs have been found in the Tertiary formations.

Hedgehog Plant, a name given to those species of medick (Medicago) which have the pods spirally twisted and rolled up into a ball beset with spines. They are particularly plentiful on sandy grounds near the sea in England, and in some parts of South America; and their pods are too plentiful in the South American wool imported into Britain. They afford excellent food for sheep and cattle.

Hedge-mustard (*Sisymbrium*), a genus of plants of the natural order Cruciferæ, annual or rarely perennial herbs, with very various foliage, small yellow or white flowers, and a long roundish or six-angled pod (silique). Several species are natives of Britain, of which one, the Common Hedge-mustard (*S. officinale*), was once employed in medicine for catarrhs and other ailments. It is an annual plant, plentiful in waste places and by waysides, sometimes two feet high, branched, with runcinate or deeply-lobed leaves, stem and leaves hairy.

Hedge-nettle. See STACHYS.

Hedge-sparrow (*Accentor modularis*) is really a small European Warbler (q.v.) resembling a sparrow in colouring.

Hedjaz. See ARABIA.

Hedjrah. See HEGIRA.

Hedley, WILLIAM (1779–1843), born at Newburn near Newcastle, the improver of Trevithick's locomotive. See RAILWAYS.

Hedonism. See ETHICS.

Heem, JAN DAVIDSZ VAN, the greatest Dutch painter of 'still life,' was born at Utrecht in 1606. In 1635 he enrolled himself in the Antwerp guild of painters; and in that city he died in 1683 or 1684. Heem's pictures represent for the most part fruits and flowers, insects and creeping things, and drinking cups, bottles, &c. Masterpieces by his hand are hung in the galleries of Amsterdam, Vienna, Berlin, Munich, St Petersburg, and other places. His drawing and colouring are exquisite, and his use of chiaroscuro unsurpassable.

Heeren, ARNOLD HERMANN LUDWIG, German historian, was born 25th October 1760, at Arbergen, near Bremen. He first made himself known by an edition of Menander's *De Encomiis* (1785), and in 1787 was appointed professor of Philosophy, and in 1801 professor of History, at Göttingen. He married in 1797 a daughter of Heyne, and died 7th March 1842. The striking feature about his teaching and writing was that he studied the peoples of classic antiquity from the modern standpoint, as the title of his principal work shows—*Ideen über Politik, den Verkehr und den Handel der vornehmsten Völker der alten Welt* (1793–96; 4th ed. 1824–26; Eng. trans. 1833). Besides this he wrote *Geschichte des Studiums der classischen Literatur seit dem Wiederaufleben der Wissenschaften* (2 vols. 1797–1802), *Geschichte der Staaten des Alterthums* (1799; 5th ed. 1828; Eng. trans. 1840), and *Geschichte des europäischen Staatensystems und seiner Colonien* (1800; 5th ed. 1830; Eng. trans. 1834), which abounded in new views and acute expositions. His *Untersuchungen über die Kreuzzüge* won a prize offered by the National Institute of France. His *Kleine historische Schriften* (3 vols. 1803–8) contain some very interesting treatises and a biography of Heyne. In 1821–26 he published an edition of all his historical works in 15 vols.

Hefele, KARL JOSEPH VON, an eminent Catholic church historian, was born at Unterkochen in Würtemberg, 15th March 1809. He studied at Tübingen, and became in 1836 *privat-docent*, and in 1840 professor of Church History and Christian Archæology, in the Catholic theological faculty of that university. He showed himself a dangerous enemy to the dogma of papal infallibility even after his consecration as Bishop of Rottenburg in 1869, by his weighty contributions to the Honorius controversy: *Honorius und das sechste allgemeine Concil* Tub. 1870), and *Causa Honorii papæ* (Naples, 1870). But after his return from Rome, in a pastoral epistle in 1871 he gave in his adhesion to the dogma, with the explanation that the infallibility of the pope, as well as that of the

church, referred only to doctrine given forth *ex cathedra*, and therein to the definitions proper only, but not to its proofs or applications. Of Hefele's writings may be named an edition of the Apostolic Fathers (1839; 4th ed. 1855); *Chrysostomus Postilla*, a translation (1845; 3d ed. 1857); *Die Einführung des Christenthums im südwest lichen Deutschland* (1837); *Der Kardinal Ximenes und die kirchlichen Zustände Spaniens im 15ten Jahrhundert* (1844; 2d ed. 1851; Eng. trans. by Canon Dalton, 1860); *Beiträge zur Kirchengeschichte, Archäologie und Liturgik* (1864-65); and especially his magistral *Konziliengeschichte* (Freiburg, 7 vols. 1855-74; 2d ed. 1873-79; the first part to the Council of Nice translated by Clark, 1871). He died 5th June 1893.

Hegel, GEORG WILHELM FRIEDRICH, was the last in a succession of four great writers, who during the later part of the 18th and the first quarter of the 19th century developed the idealistic philosophy of Germany; the other three being Kant, Fichte, and Schelling. He was born at Stuttgart on the 27th August 1770, and educated at the university of Tubingen, where he formed an intimate friendship with Schelling, his philosophical predecessor. Schelling was five years younger than Hegel, but very precocious. His rapid intuitive genius urged him to express his thoughts almost before they were ripe for expression, and he had begun to publish important contributions to philosophy even before his student-life had come to an end. Hegel, on the other hand, was slow in his intellectual development, and from a desire for systematic completeness and consistency he was unwilling to utter his thoughts till he had made all their relations clear to himself. Consequently he passed through the university without any special distinction, and it was not till six years after he left it—years during which he maintained himself by acting as a private tutor—that he began to seek academic work and to bring his views upon philosophical questions before the public.

In 1801, however, he entered upon his scholastic career at the university of Jena, publishing at the same time an essay on the difference between the philosophies of Fichte and Schelling, in which he on the whole placed himself on the side of the latter, though not without indicating some divergences of view. From 1801 to 1806 he continued to teach in the university of Jena, first as a *privat-docent* (or licensed lecturer), and then as a professor extra-ordinary, and in the early part of that period he joined with Schelling in writing a philosophical periodical called the *Critical Journal of Philosophy*. At this time the two philosophers were so closely identified in their views that there has been considerable dispute as to the authorship of some of the articles. In one of Hegel's latest contributions, however, the reasons for his subsequent separation from Schelling are clearly indicated. It was not till 1807 that Hegel published the *Phænomenology of the Spirit*, the first work in which he fully exhibited the depth and independence of his philosophic genius. By this time, mainly in consequence of Napoleon's victory over the Prussians, the university of Jena was for a time broken up, and Hegel was forced to find employment as the editor of a newspaper at Bamberg. In the following year he was appointed director of the gymnasium or public school of Nuremberg, where he remained during the next nine years. In 1811 he married, and in the following year he published the first volume of his greatest work, the *Logic*, a treatise which treats of what is ordinarily called Logic in connection with Metaphysic. It was not till 1816 that his growing fame as a writer secured his nomination to a professorship in Heidelberg; this, two years after, he exchanged for the chair of Philosophy at Berlin formerly occupied by Fichte. There he continued to teach till the 14th November 1831, when he was carried off by a sudden attack of cholera. During these years he published several works, of which the most important is the *Philosophy of Right*, and contributed several articles to the *Philosophical Year-book*, a journal which was mainly, though not exclusively, the organ of his disciples. His influence during this period was so great that he might also be said to have been the philosophical dictator of Germany. At his death a number of his friends combined to prepare a complete edition of his works, in which they included not only the books he had published during his lifetime, but also reports of courses of lectures delivered by him upon many departments of philosophy. Among these may be mentioned specially his lectures upon the *Philosophy of Religion*, the *Philosophy of Art*, the *History of Philosophy*, and the *Philosophy of History*.

It is impossible within our limits to characterise adequately the work of such an encyclopædic mind as Hegel's, but it is possible in a few words to indicate the main tendencies of his philosophy. In the first place, Hegel was an *Idealist*. By this it is meant, however, not that he reduced the facts of the outward world to ideas, or held that there are no facts but the ideas of the individual mind. It is meant only that he held that we must ultimately explain the world as the manifestation of a rational principle. Kant had shown that all known or knowable objects are relative to a conscious subject, and that therefore we cannot legitimately treat them as *things in themselves*—i.e. as things that might exist by themselves even if there were no intelligent principle in existence to know them. He had shown, in other words, that existence means nothing unless it means existence for a self. Hegel carried the argument a step further, and maintained that the world of objects is not only related to an intelligence, but that it can be nothing but the revelation or manifestation of intelligence. In this way he sought not only with Kant to show the impossibility of a materialistic explanation of things, but to prove the necessity of an idealistic explanation of them. He did not therefore deny the reality of the material world, but maintained it to be an imperfect or incomplete reality which could not exist by itself without something else to supplement it. He attempted to prove that matter is the necessary object and counterpart of spirit, in which spirit reveals, and through which it realises, itself; and that indeed the material world only shows its ultimate meaning, when we regard it as the natural environment and basis for the life of spiritual beings.

In the second place, Hegel connected this idealistic or spiritualistic view of things with the great modern idea of *Evolution* or *Development*. That idea is often supposed to involve that the highest and most complex existences may be traced back to the lowest and simplest—that, for example, we may hope ultimately to explain the phenomena of life by mechanics and chemistry, and the phenomena of thought and will by the powers of nutrition and sensation which are manifested in the lowest forms of animal life. And in a similar way the idea of evolution is supposed to imply that we can explain the highest forms of religion as nothing more than refined reproductions of the crude superstitions of savages. Hegel, on the other hand, maintains that, as it is the developed form that first tells us what was in the germ, as it is only the life of the man that shows what was latent in the child, so under the idea of evolution we must take the man as explaining the animal, and the

organic as exhibiting what is latent and obscure in the inorganic. Not, indeed, as if the special sciences of mechanics, chemistry, biology, &c. were not right in keeping to their own special principles. But, in the last resort, when we attempt, as it is the business of philosophy to attempt, to see all these spheres of existence in their relation to each other, as well as to the intelligence that knows them, we must regard nature as becoming self-conscious—i.e. as revealing its secret meaning only *to* and *in* man; and we must find the key to the secret of man's nature in the highest energies of his moral and intellectual life.

Finally, in attempting to work out this idea of evolution Hegel teaches us to regard it as a *progress by antagonism*. While, therefore, there is a unity of principle in all things that exist, yet, in order to develop, this principle must differentiate itself, must manifest itself in different forms, and these forms must inevitably come into conflict with each other. In truth, however, the forms which have thus come to be opposed are really complementary or necessary to each other, and therefore their conflict is limited by the unity which they express, and which ultimately must subordinate them all to itself. This idea may be most easily illustrated by reference to the unity of the social organism, which manifests itself in a division of labour between its members. In developing their powers these members are brought into antagonism with each other; but if their conflict and competition is not to destroy the society, it must be subordinated to their co-operation. That the organic unity of the society should maintain itself means, therefore, that there should be such community between its members that all their conflict and competition should only lead to a better distribution of functions between them, and should thus contribute to direct and improve the life of the society as a whole. This illustration may give some clue to the principle which Hegel works out in application to all spheres of the life of nature and of man. On it is based Hegel's ultimate division of philosophy into the three departments—logic, or the science of thought in its pure unity with itself; the philosophy of nature, in which the ideal principle, which is supposed to exist in all things, is shown to underlie even the externality of the material world; and the philosophy of spirit—i.e. of the life of man as a self-conscious being, standing in relation to a material world, which seems to be altogether external to him, and yet subordinating it to his own life. But these words are the indication of ideas which it would take many pages fully to explain.

Hegel's collected works, edited by a number of friends and disciples, appeared after his death in 18 vols. (1832–45). On his life and philosophy, see Rosenkranz, *Hegels Leben* (1844), *Apologie Hegels* (1858), and *Hegel als Deutscher Nationalphilosoph* (1870); Haym, *Hegel und seine Zeit* (1857); Kostlin, *Hegel* (1870); the histories of this period of German philosophy by Michelet (1838), Chalybaus (5th ed. 1860), and especially Erdmann (vol. iii. 1848–53); Hutchison Stirling, *Secret of Hegel* (2 vols. 1865); Wallace, translation of the *Logic* from the *Encyclopædia*, with prolegomena (1874); E. Caird, *Hegel* (in 'Philos. Classics' series, 1883); Seth, *The Development from Kant to Hegel* (1882); *Hegel's Æsthetic*, by Kedney, *Hegel's Logic*, by W. T. Harris, *Hegel's Philosophy of Religion*, by A. M. Fairbairn, *Hegel's Philosophy of History and the State*, by G. S. Morris (Chicago, 1886–90). There are translations of Hegel's *Philosophy of History*, by Sibree (1857), of the *Philosophy of Right*, by Dyde, of the *Philosophy of Art*, by Hastie and by Bosanquet, of the *Philosophy of Religion*, by Speirs and Sanderson, and of the *History of Philosophy* (3 vols. 1892–96), by Miss Haldane.

At the time of Hegel's death his philosophy was dominant in Germany; and at that time there seemed to be a consensus among his pupils as to its interpretation. But division soon arose between those who, following the apparent tendency of their master, interpreted the principles of Hegelian philosophy in an orthodox and conservative spirit, and those who emphasised its negative dialectic, and used it as a weapon of attack against the existing order of church and state. After the appearance of Strauss's *Leben Jesu* (1835) the school may be regarded as having broken up into 'Old Hegelians,' or 'the Right'—Hotho, Gabler, Erdmann, Daub, Marheineke, Göschel; 'the Centre'—Rosenkranz, Gans, Vatke, Conradi; and 'the Left,' the 'Young Hegelians'—Strauss, Michelet, Feuerbach, Bruno Bauer, Ruge, Karl Marx—of whom some even maintained that the legitimate development of the philosophy was found in atheism, materialism, and communism. The result of these controversies was that the Hegelians almost ceased to exist as a definite school; but the ideas of Hegel still retain their power, and form one of the most important elements in modern culture. Many who cannot be regarded as in any strict sense Hegelians have owed their main philosophic stimulus to Hegel—such as F. C. Baur, Schwegler, Zeller, Kuno Fischer; and the so-called 'Pseudo-Hegelians' I. H. Fichte, Weisse, Chalybäus, Ulrici, Carrière. Hegelianism is the most important element in the philosophy of the popular pessimist Von Hartmann. Out of Germany, Hegelianism is represented more or less directly by Heiberg and Martensen in Denmark; in France, by Leroux, Prevost, and others; in Italy, by Vera and Mariano; in Britain, by Hutchison Stirling, J. Caird, E. Caird, Wallace, Green, and Bradley; in America, by W. T. Harris and others.—Hegel's eldest son, Karl (born 1813), became distinguished as an historian, and was professor of History successively at Rostock and Erlangen.—Another son, Immanuel (1814–91), held high administrative offices under the Prussian government, and was leader of the Conservative and High Church party.

Hegesippus, the earliest of the Christian church historians; of his life we know nothing save that he was almost certainly a Jewish convert and that he flourished about the middle of the 2d century. From a statement of his own, preserved in Eusebius (iv. 22), we learn that he made a journey to Rome, visiting Corinth upon the way, and when at Rome compiled a list of the bishops of the Roman see down to Anicetus (156–67 A.D.). Further, he is represented as adding 'to Anicetus succeeds Soter; and to Soter, Eleutherus' (175–89). Hegesippus must thus have written most of his history previous to 167 A.D., and he most probably published it early in the episcopate of Eleutherus. This agrees well with the statement of St Jerome that Hegesippus had bordered on the apostolic age (*vicinus apostolorum temporum*), for if born so early as 120 he came very near the age of St John. His work was entitled *Five Memorials of Ecclesiastical Affairs*, and appears not to have been a complete and continuous history, although extending from the death of Christ to the writer's own age. Unhappily it survives only in a few fragments which Eusebius had embodied in his own history, the most important of which are his account of the martyrdom of St James and also of St Simeon of Jerusalem. Eusebius commends his doctrinal fidelity, and St Jerome the simplicity and unpretentiousness of his style. The question has been much discussed whether Hegesippus belonged to the Judaising Christian party or not. Baur went so far as to pronounce him a declared enemy to St Paul, relying mainly upon a passage preserved in Photius, in which Hegesippus declares that an opinion of many, corresponding exactly to what is said in 1 Cor. ii. 9, is contradictory to the express word of the Lord himself in Matt. xiii. 16. But it is much more likely that Hegesippus is here aiming at the Gnostic misconception of these words rather than that of St Paul, for the reference is obviously to their claims to special spiritual insight; while a further passage preserved, used by the Tübingen school to fortify their inference—viz. that those who were

trying to destroy the sound rule of saving doctrine as yet had themselves in holes of darkness can by no possibility be understood as a reference to the heedless and vehement apostle of the Gentiles.

The fragments of Hegesippus will be found in vol. i. of Routh's *Reliquiæ Sacræ* (1847), and in vol. ii. of Grabe's *Spicilegium*.

Hegira, Hejira, or Hijra—an Arab word which means 'going away'—the term commonly used to indicate Mohammed's flight from Mecca, 13th September 622 A.D. In 639 or 640 the Calif Omar instituted a new Moslem calendar, to begin with the first day of the first month of the year in which the flight took place. The Mohammedan year, as a lunar year, is shorter than ours by 10 days, 21 hours, and 14 seconds. A rough and ready method for finding the year in our calendar corresponding to a given year in the Mohammedan is to subtract from the latter $\frac{3}{100}$ of itself and add 622 to the remainder. To find the precise year and day, multiply the year of the Hegira by 970224, strike off from the product six decimal figures, and add 621·5774; this will give the year of the Christian era; and the day of the year is got by multiplying the decimal figures by 365.

Heiberg, the name of two Danish authors. See Denmark, Vol. III. p. 759.

Heide, the chief town of northern Ditmarsh, in the Prussian province of Sleswick Holstein, 58 miles by rail WSW. of Kiel. Chief industries are shoemaking, paper-making, and brewing. Heide is the birthplace of Klaus Groth. Pop. 7355.

Heidelberg, an ancient city of Germany, in the grand-duchy of Baden, extends for about 3 miles along the left bank of the river Neckar, in one of the most beautiful districts in the country, 13 miles by rail SE. of Mannheim and 54 S. of Frankfort-on-the-Main. It lies 380 feet above sea-level, at the base of the Königsstuhl (1863 feet). Among its most important buildings are the church of the Holy Ghost, a splendid example of Late Gothic architecture, in which service according to the Catholic and Protestant rituals is simultaneously carried on; the church of St Peter's, on the door of which Jerome of Prague nailed his celebrated *theses*, and the magnificent ruins of the castle, which stand on a hill 330 feet above the town. Begun at the close of the 13th century, and added to in 1410, 1559, and 1607, it was formerly the residence of the Electors Palatine, and was in great part destroyed by the French in 1689 and 1693, and further injured by lightning in 1764. In the cellar under the castle is the famous Heidelberg Tun, once capable of containing 50,000 gallons of wine. Heidelberg is celebrated for its university, which was founded by the Elector Rupert I. in 1386, and continued to flourish until the period of the Thirty Years' War, when it began to decline. In 1802, however, when the town with the surrounding territory was assigned to the Grand-duke of Baden, a new era commenced for the university, and it rapidly became famous. It comprises faculties of theology, law, medicine, and philosophy, has about 110 professors and lecturers, and is attended by about 800 students. Its library consists of some 500,000 volumes and 4700 MSS. Many of the most famous German scholars have been professors here—Reuchlin, Œcolampadius, Spanheim, Puffendorf, Voss, Schlosser, Creuzer, Gervinus, Paulus, Kuno Fischer, Helmholtz, Bunsen, Bluntschli, &c. The quincentenary of the university was celebrated with elaborate ceremonial in 1886. Heidelberg, originally an appanage of the bishopric of Worms, became in the end of the 12th century the seat of the Counts Palatine, and continued to be so for nearly six centuries. After the Reformation Heidelberg was long the headquarters of German Calvinism, and gave its name to a famous Calvinistic Catechism (q.v.). The trade is chiefly in books, tobacco, beer, and wine. The town suffered much during the Thirty Years' War, was savagely treated by the French in 1689, and was in 1693 almost totally destroyed by them. Pop. (1871) 19,988; (1890) 31,739, of whom a third are Catholics and about 800 Jews. See works by Oncken (3d ed. 1885), Drum (1884), and Thorbecke (1886); also *The Century Magazine*, August 1886.

Heights may be determined by four methods: by Trigonometry (q.v.), by Levelling (q.v.), by ascertaining and comparing the atmospheric pressure at top and bottom of the height by the Barometer (q.v.), or by ascertaining and comparing the boiling-point of water at the top and bottom by the Thermometer (q.v.). See also Surveying.

Heijn, or Heyn, Piet, a famous Dutch admiral, was born in 1570 at Delftshaven, near Rotterdam. After an adventurous career, he became vice-admiral under the Dutch East India Company. In 1624 he sailed to South America and defeated the Spaniards near San Salvador (Brazil), and again in 1626 in All Saints' Bay (Bahia), when he took above twenty of their ships, returning to Holland with an immense booty. Two years later he captured the Spanish silver flotilla, the value of which was estimated at 16,000,000 Dutch guilders. As a reward for this success he was in 1629 named Admiral of Holland. On 20th August of the same year he met his death in a sea-fight against the privateers of Dunkirk off that town. A marble monument is erected to his memory in the old church at Delft.

Heilbronn, a town of Würtemberg, situated on the right bank of the Neckar, in a beautiful and fertile region, 28 miles by rail N. of Stuttgart. The streets of the old medieval town are narrow, and the houses have quaintly ornamented gable-ends and tapering pinnacles. The church of St Kilian, partly Gothic and partly Renaissance; the old town-hall; the *Diebsthurm* ('Thief's Tower'), in which Götz von Berlichingen was confined; and the house of the Teutonic Knights, now a barrack, are the principal buildings. The chief industries include the manufacture of silver-plate, paper, sugar, salt, chicory, and chemicals, and there are iron and other metal foundries and machine-shops. Fruit and wine are largely grown. Commercially the importance of Heilbronn depends upon its trade in groceries, corn, and wood, and upon its fairs for cattle, leather, wool, and fruit. In the vicinity gypsum and sandstone are quarried. Heilbronn is first mentioned in 741; in 1360 it became an imperial town; it suffered during the Peasants' War and the Thirty Years' War, and in 1802 it fell into the hands of Würtemberg. Pop. (1875) 21,208; (1890) 29,941.

Heiligenstadt, a Catholic town of Prussian Saxony, situated on the Leine, 32 miles ENE. of Cassel by rail, has manufactures of cotton, cigars, paper, and pins. Pop. 5861.

Heilsberg, a town of Prussia, 40 miles S. of Königsberg. It was originally the chief town of Ermeland, one of the old divisions of Poland, and received town rights in 1308. Here the allied Russians and Prussians under Bennigsen defeated the French under Soult and Murat on 10th June 1807. Pop. 5705.

Heilsbronn, a Bavarian village of middle Franconia, 16 miles SW. of Nuremberg by rail, was the seat of a celebrated Cistercian monastery, which owed its origin to Bishop Otho of Bamberg in 1132. Nearly all the burgraves of Nuremberg were buried here till the end of the 15th century,

when it became the burial place of the Franconian branch of the Hohenzollerns. Although the monastery was suppressed in 1555, the church still retains a large number of highly-interesting sepulchral monuments and other examples of medieval German art. See works by Stillfried (1877) and Muck (3 vols. 1879–80).

Heimskringla. See SNORRI STURLASON.

Heine, HEINRICH, the most prominent figure in German literature since Goethe and Schiller, was born of Jewish parents on 13th December 1797, in Düsseldorf-on-Rhine. His boyish heroes were Napoleon and Napoleon's stalwart grenadiers and drummers. At a Roman Catholic school in Düsseldorf he learned what it was to be jeered at and ill-treated on account of his race and creed. At sixteen he was sent to Frankfort to learn banking, but he soon gave it up; routine work was wholly repugnant to him. Next he tried trading on his own account in Hamburg, but soon failed. About the same time he fell in love with a daughter of his rich uncle, Solomon Heine of Hamburg; and his grief at her non-requital of his passion, jealously nursed as it was, formed a stimulus to poetic creation. At length in 1819 his uncle gratified the desire of his heart by sending him to the university of Bonn. There, and subsequently at Berlin and Göttingen, he studied law, taking his doctor's degree at Göttingen in 1825. But his thoughts were more given to poetry and kindred subjects than to legal studies. At Bonn A. W. Schlegel helped him to master the technique of his art. At Berlin, in the circle over which Rahel, the wife of Varnhagen von Ense, presided, he found himself for the first time in a wholly congenial atmosphere; and the close friendship formed between them lasted till Rahel's death. In the efforts then being made in Berlin by Ganz and others to inspire the Jews with a sense of the value of European culture Heine also took an active share. In 1821 he published his first volume of *Gedichte*, which at once arrested the attention of the observant. After unsuccessful essays in tragedy-writing, a second collection of poems, entitled *Lyrisches Intermezzo*, his Sapphic love-plaint, appeared in 1823. But the general public only became aware that a new writer of the first magnitude had risen in the heavens of literature when in 1826–27 the first and second volumes of the *Reisebilder* came into their hands. In the latter year Heine likewise celebrated his triumph as conqueror of a new poetic province in *Das Buch der Lieder*, which, though consisting almost entirely of poems already published, created throughout Germany such excitement as had not been since Schiller's *Räuber* came out. Many of Heine's best songs are as much loved for the beautiful melodies to which they were set by Schumann and Mendelssohn as for their own intrinsic merit.

These two works are Heine's masterpieces; he never wrote anything to excel them. Nearly all his writings are of an occasional nature, either lyrical, or autobiographical, or journalistic, or polemical. But the genius in them is permanent, and in many respects of the highest quality. The great charm of his work is due to the fact that he was a superb literary artist, a consummate master of style in both verse and prose. He was essentially a lyrist; his song has the spontaneity and melody of a skylark's burst, or the quaint naïveté, the pathos, the simple sweetness of the best *Volkslieder*. His was a very complex and paradoxical nature: he united in himself the passionate energy of a Hebrew prophet, the sensuous feeling of a pagan Greek, and the dreamy sentimentalism of a medieval German. The simplicity of a pure child of nature is blended with the keenest wit, with an irony that is apt to grow bitterest when his lyric mood is sweetest, and a power of mocking sarcasm that cuts sharp and deep. His mastery in the art of self-torture taught him how to lash the follies and absurdities of the conventional world with the roughest rawhide of Mephistophelean scorn. His writing is full of surprises, as capricious as the sea he loved so passionately. His intellect has the suppleness and grace and sinewy strength of a highly-trained athlete, but it neither walks nor glides; it leaps, and turns and doubles with the glancing swiftness of a swallow on wing. He passes from exquisite tenderness to sardonic cynicism, from melancholy sadness to sly insidious humour, in the twinkling of an eye. Nor is sweet dreamy sentiment in him any hindrance to remarkable precision of thought. But perhaps his strangest quality is an audacity of intellect that hesitates at no utterance, that recoils from no jest on things even the most sacred. His language is terse, clear, and rich in word-pictures, mostly original, seldom glittering with the tinsel of mere conventional imagery. One of his favourite devices is to mingle the images of dreamland, unearthly and weird, with images of true poetic beauty forged from the raw ore of commonest reality. But, notwithstanding his delicate poetic sensibility, and the depth and sincerity of his feeling, his poetry had its origin in dissonance of soul; the *Weltschmerz* had eaten deeply into his heart. The prophet of poetic pain, he scruples not to lay bare his soul to us without reserve; we see the man just as he is, with all his beauties, with all his faults. And these last are neither few nor venial. His sensuousness often degenerates into obscenity and coarseness, his wit into vulgarity and affectation, his irony into malice and persiflage. He becomes cynical, frivolous, a mocker. Not only does he show no sense of reverence himself, he wantonly outrages the reverent feelings of his readers. And he has just 'feminity' enough in his constitution to find pleasure in spiteful personalities.

In June 1825 he had himself baptised a Christian, exchanging his original name Harry for Christian Johann Heinrich, though he used only the last of the three. This step, which proved to be one of the most unfortunate of his life, was not taken from conviction, but simply to secure for himself the common rights of German citizenship, and to give himself a respectable standing in the world. Heine, however, by this act only alienated from him the esteem of the orthodox among his own people. His revolutionary opinions, and his trenchant and outspoken criticism of the governments of the day, always remained insuperable hindrances to his appointment to any official employment in Prussia, and even in Germany. During the years of early manhood, from 1823 onwards, he was racked by excruciating headaches, which reacted upon his temper and his mood. Then again, he lived on a strained footing with his Hamburg relatives; they were shrewd business folk, and could see no virtue in poetship, and nothing 'divine' in the poet himself—and Heine was inclined to presume upon his success. He was always greatly harassed by the unscrupulous tyranny of the public censor: his works came from the press grievously maltreated, and against this injustice he could get no remedy. Moreover, he felt himself coming perilously near to the doors of a German fortress-prison. No wonder then that, when his enthusiasm was roused by the July revolution in Paris, he turned his back upon Germany and hastened thither, going into a voluntary exile from which he never returned. But he had not been altogether idle during the six unhappy years since 1825. He had travelled

to England and Italy, he had worked on the editorial staff of Cotta's newspapers in Bavaria; and, besides *Das Buch der Lieder*, he wrote four volumes in all of *Die Reisebilder*, the last two (1830-31), however, inferior to the others.

In Paris Heine, whose intellectual character and intellectual sympathies were always more French than German, soon made himself at home. He seemed a patron in the minister Thiers, and consorted with the greatest writers and chief celebrities then living in Paris; and yet he often longed to return to the Philistines of Germany. For, in spite of the fact that he railed at his Jewish descent and poured scorn upon his German compatriots, he was always a German at heart and had a secret admiration for the persecuted people from whom he was sprung. Nor was this by any means the only inconsistency in his nature. Though he scoffed at religion, yet was there a deeply religious vein in his composition—the Bible was always a favourite book with him; though he was deplorably lax in his ideas and practices of morality, he was not insensible to the beauty of purity; and though he ridiculed the vagaries of the romantic school, he cherished a lingering fondness for its ideals.

The July revolution seems to have awakened in Heine the first stirrings of manly seriousness. He turned from poetry to politics, with which he had always coquetted ever since he began to write. He entered Paris glowing with the inspiration of the revolution. He assumed the rôle of a tribune of the people, a leader of the cosmopolitan democratic movement, the object of which was to effect the union of the peoples of all nations in a brotherhood of liberty and progress. It was under the inspiration of this ideal that he greeted with acclamation the socialistic doctrines of the St Simonists, at all events in so far as economics and religion were concerned. One of the chief aims of his life was to make the French and the Germans acquainted with one another's intellectual and artistic achievements. This was the ground out of which sprang the *Französische Zustände* (1833), a collection of papers on affairs in France, first printed in the *Augsburger Allgemeine Zeitung*; *De l'Allemagne* (1835), the French version of *Die Romantische Schule* (1836) of Germany, that is; and *Zur Philosophie und Literatur in Deutschland*, forming part of the second of the four volumes of miscellaneous writings entitled *Der Salon* (1835-40). Heine was always an Ishmael, not only of literature but also of politics—he would fight under nobody's flag but his own; and hence, with his aristocratic instincts and refined taste, he refused to make common cause with the revolutionary fugitives from Germany who found an asylum in Paris. Yet he seems not to have been altogether above the suspicion, if not of insincerity, at least of desiring to win the crown of the political martyr without undergoing the pains of political martyrdom. At all events, his ambiguous attitude brought down upon him the spiteful enmity of his revolutionary compatriots; and their hostility was greatly embittered by the publication of Heine's ungenerous attack upon his former friend and political associate Börne (1840). Nor did he enjoy any better savour of grace from the governments of Germany because of his personal aversion to their dreaded enemies. In 1835 his writings, past and prospective together, had been condemned, along with those of the Young Germany school, by the Confederation parliament at Frankfort, and this measure was not repealed until 1842.

Although Heine loved liberty with his whole soul, and lived and suffered for it, it seems never to have been anything more to him than a romantic ideal. The truth is he stood on the continental watershed of two wholly different *Weltanschauungen* ('world-conceptions'), the old world of romantic feudalism and the new world of scientific inquiry and individual freedom. He had nothing but scorn for the tyrannous era of priestcraft and aristocracy, and nothing but sarcasm and ridicule for the inert mass of commonplace Philistines, with their intellectual apathy and self-satisfied somnolence. Respecting the future he cherished the most sanguine hopes. He foresaw in imagination the glorious regeneration of the peoples; and Germany was, he believed, the agent of promise destined to effect this great change. Nor must it be imputed to him for blame that he never grasped the problem of the practical realisation of his ideal, that he never thought of the means and forms by and in which this romanticism of the revolution of progress was to be converted into the concrete realism of accomplished fact. For, though he criticised the past and projected his hopes into the future, his heart was knit to the past with the tenderest associations of feeling, and his sceptical intellect would not allow him to remain blind to the imperfections of his prospicient dreams. It need not therefore excite surprise to find traces of the sentimental declaimer in Heine's war-song of liberty, despite his evident earnestness in the cause. For, after all, his love for humanity was beyond all suspicion warm and deep, and his zeal for intellectual freedom unquestionably sincere.

His last years, from 1844 onwards, were years of great pain and suffering. His book on Börne provoked a kind of hornet's nest about his ears. On the eve of a duel, which it ultimately cost him, he married in due legal form Mathilde Mirat, a Paris grisette, with whom he had been living some years in free love. Then came his uncle Solomon's death, and a quarrel with the family, because of their refusal to continue the annuity he had received from his uncle from the year he settled in Paris. A compromise was effected early in 1847: the payment of the annuity was resumed, Heine pledging himself not to publish anything reflecting on the family. For this reason his *Memoiren*, which he anticipated would be his greatest work, was withheld from publication. The fate of the manuscript is a mystery. Heine speaks of having destroyed it. Yet it is both asserted and denied that it passed into the possession of his brother Gustav. At all events the fragmentary *Memoiren* published in 1884 can scarcely be part of the original work; it is in all probability a portion of the new version begun by Heine. The revolution of 1848, unlike that of 1830, failed to awaken any enthusiasm in him. Since 1837 his eyes had caused him much pain, and since 1844 he had been confined to his bed by spinal paralysis. He lingered on in excruciating pain, borne with heroic patience and endurance, until 17th February 1856. But no amount or intensity of bodily suffering could break his spirit or impair his creative power; he jested and wrote to the last. During these years he published *Neue Gedichte* and *Deutschland*, a satirical political poem, in 1844; *Atta Troll*, the 'swan-song of romanticism,' in 1847; a collection of poems, *Romancero*, in 1851; and three volumes of *Vermischte Schriften*, in 1854.

Complete editions of Heine's works have been edited by Strodtmann (21 vols. 1861-66), Karpeles (12 vols. 1885 and 9 vols. 1886-87), and Elster (5 vols. 1887), and in French by himself, assisted by Gérard de Nerval and others (14 vols. 1852 *et seq.*). The best biographies of Heine are those by Proelss (1886) and Strodtmann (3d ed. 2 vols. 1884). See also *Heines Autobiographie* (a mosaic) by Karpeles (1888), and Lives by W. Sharp (1888) and Stigand (1875). Heine's poetry has a fatal fascination for translators. Versions have been essayed by

Ackerlos (1854), Wallis (1856), Bowring (1859), Lord Lytton, Sir Theodore Martin (1879), J. Geikie (1887), and others. Heine's works have been translated by Leland (vol. i. 1891), and parts of the prose by Stern (1873), Snodgrass (1882), Storr (1887), Havelock Ellis (1888), R. M'Clintock (1890), &c. *Wit, Wisdom, and Pathos*, extracts from Heine's prose, translated by Snodgrass (1879; 2d ed. 1888), may also be consulted.

Heineccius, JOHANN GOTTLIEB, a jurist of Germany, born 11th September 1681 at Eisenberg, was professor of Philosophy at Halle from 1713, and from 1720 professor of Law. In the latter capacity he went in 1723 to Franeker, and in 1727 to Frankfort-on-the-Oder; but in 1733 returned, as professor of Law and Philosophy, to Halle, where he died 31st August 1741. Heineccius belonged to the school of those who treat law in dependence upon philosophical principles. His chief works were *Antiquitatum Romanorum Jurisprudentiam Illustrantium Syntagma* (1718); *Historia Juris Civilis Romani* (1733); *Elementa Juris Germanici* (1735); and *Elementa Juris Naturæ et Gentium* (1737; Eng. trans. 1763). His *Opera Omnia* (9 vols.) were edited by his son in 1771.—Heineccius's brother, JOHANN MICHAELIS HEINECCIUS (1674–1722), was a celebrated pulpit orator in Halle, and the first who studied seals scientifically. On this latter subject he wrote *De Veteribus Germanorum aliarumque Nationum Sigillis* (1709).

Heinsius, ANTHONY, Dutch statesman, born at Delft, 22d December 1641, studied law at Leyden, in 1688 became Grand Pensionary of Holland, and as the close friend of William III. (of England) guided Dutch politics till his death, 30th August 1720.

Heinsius, DANIEL, a Dutch classical scholar, was born at Ghent, 9th June 1580; was educated at Franeker and Leyden (becoming the favourite pupil of Scaliger), and became professor at Leyden. He died 25th February 1655. He edited many Latin classics, and published Latin poems and orations of his own.—His son, Nicolaus (1620–81), obtained distinction both as a diplomatic agent and as a classical scholar.

Heir. In primitive systems of law the heir is the person who performs the sacred rites on the death of his ancestor, and to whom, as representing his ancestor, the property of the deceased is transferred. There are traces of this primitive conception in the history of Roman law. The later Roman law regards the heir as an universal successor, on whom all the rights and liabilities of the ancestor devolve. An heir might be named by will; in case of intestacy, the law pointed out the line of succession; in some cases equity gave possession to a person who was permitted by a fiction to call himself heir, though not legally entitled to inherit. The liabilities of an heir were restricted by rules which enabled him to separate his own estate from that of the deceased; after Justinian's time this was done by 'making an inventory;' and this 'benefit of inventory' is a feature of modern codes founded on the civil law. It is to be observed that the Roman heir united in himself the rights of the heir, executor, and devisee of English law.

In English law the heir is not the universal successor, but the person who succeeds to the *real* property of a deceased person not disposed of by will. He is bound by covenants, &c. which have been made binding on the land; the property which descends to him has been made assets for payment of debt generally; but if the personal estate be sufficient, the executor is the person by whom debts should be paid. The heir is ascertained at the moment of death; thus it is not technically correct to speak of the eldest son of a living person as his heir; the son is *heir-apparent*—i.e. it is evident that he will be the heir if he survives. If a father or brother is nearest in succession to a living person, we call him *heir-presumptive*; he will be the heir if he survives, and if no nearer heir is born. An heir must be sought among persons related by consanguinity to the deceased, males being preferred. Of males in the same degree, the eldest is sole heir; females in the same degree succeed as co-heiresses or coparceners. By the Inheritance Act of 1833 it is directed that descent is to be traced from the last purchaser—i.e. the last person who acquired the land otherwise than by descent. Formerly an estate could not ascend from son to father; but the act places the father next in succession after children and other descendants. For a tabular view of the order of succession, see Williams, *On Real Property*, or Paterson's *Compendium of English and Scotch Law*. The *heirs-general* are the heirs ascertained according to the foregoing rules, as distinguished from the restricted class (heirs of the body, heirs-male, heirs-female, &c.) pointed out by the terms of an entail. Where no heir can be found, the land is escheated to the feudal superior to whom it is held—i.e. usually to the crown. When a person dies intestate, his real estate vests at once in the heir; the heir becomes seised in law without entry on the estate or other formality. The rule which permits an heir to shift the liability for debts to the personal estate was formerly applied even to mortgages; but Locke King's Act, passed in 1854, makes a mortgage debt a charge on the land, unless a contrary intention is expressed.

The law of succession in Ireland is the same as in England.

In Scotch law the term heir is less strictly defined than in English law. It is used to include persons who succeed to movables. It also includes persons who take, not by descent, but by gift; thus, for example, 'heirs of destination' or 'heirs of provision' would be described as devisees or donees in English law. 'Heir-apparent,' in Scots law, means an heir who has not made up his titles, the heir-apparent of English law being included under the name of heir-presumptive; but since the Conveyancing (Scotland) Act of 1874 the inheritance vests on the death of the owner, and the heir is not required to make up titles. By the same act it is provided that an heir shall not be liable for the debts of his ancestor beyond the value of the estate. When heritable property has not been settled or disposed of by the owner, the *heir of line* is sought among the legitimate kin of the deceased. As in England, males are preferred; of males in the same degree, the eldest is sole heir; females inherit together as 'heirs-portioners.' But in Scotch, as compared with English law, certain points of difference are to be observed. (1) After descendants are exhausted, it is not the father, but the next younger brother who is next in succession; then the next younger again, and so on to the youngest brother, after whom and his descendants comes the next elder brother, and so on up to the eldest brother. Formerly 'fee of conquest'—i.e. land purchased by the deceased—went to the next elder brother, and so on, in preference to the next younger; but the distinction between conquest and heritage was abolished in 1874. (2) The mother never succeeds in Scotland, nor any relatives who trace through her, except brothers and sisters german. (3) Persons born illegitimate, but rendered legitimate by the subsequent marriage of their parents, are permitted to succeed. See the comparative tabular view in Paterson's *Compendium*.

In England the term 'hereditaments' is used to denote those parts of a man's property which will, if not disposed of, descend to the heir. In Scotland heritable property includes leaseholds, which in

England are treated as personal property; certain classes of annuities are also heritable, which would in England be personal.

HEIRS-PORTIONERS, in Scotch law, mean either two or more females, being sisters, or sisters and the children, male and female, of deceased sisters, who are entitled to succeed to heritable estate when their ancestor dies without leaving male issue. Thus, if A dies leaving three daughters, all three succeed equally if alive; or if some have already died leaving children, then the children represent the parent, and succeed to the parent's share along with the surviving sisters, all being called heirs-portioners. In such cases the eldest heir-portioner is entitled to the mansion-house of an estate in the country over and above her equal share of the rest. But she has no such right to a house in town, or to a country villa. She alone also takes a peerage or dignity, if there is any in the family. In England coparceners, though resembling heirs-portioners, have not identical rights.

Heirloom (compounded of *heir* and *loom*, originally a 'piece of property,' 'furniture'), in English law, means a chattel, or movable thing, which goes to the heir-at-law by special custom. But the right is obscure. The word is more frequently used now to designate chattels bequeathed or settled so as to be enjoyed by the person for the time being in possession of a family estate or mansion. In Scotland a somewhat similar but by no means identical phrase is used—viz. *heirship movables*, which is a wider right, and includes the best articles of furniture in the house of a person who left heritable property. The extent of this right is also not clearly settled.

Hejra. See HEGIRA.

Hel, in Northern Mythology, the goddess of the dead, the sister of the wolf Fenrir, and daughter of the evil-hearted Loki (q.v.), by the giantess Angurboda. The All-father hurled her down into Niflheim, and gave her authority over the lower world, where she received all who died of sickness and old age. She was of fierce aspect, and had a half black, half flesh-coloured skin. To her were assigned the characteristics of insatiable greed and pitilessness. After the introduction and diffusion of Christianity the ideas personified in Hel gradually merged, among all the races of Scandinavian and German descent, in the local conception of a Hell (q.v.), or dark abode of the dead.

Helder, THE, a thriving seaport and strongly-fortified town in the Dutch province of North Holland, 51 miles by rail NNW. of Amsterdam. It stands on the Marsdiep, which connects the Zuider Zee and the German Ocean, and at the northern extremity of the North Holland Canal, by which, too, it has connection with Amsterdam. It is one of the strongest fortresses in Holland, having been first fortified by Napoleon in 1811, and has several naval establishments, including an arsenal and a college, and an excellent harbour. Pop. (1895) 25,254. Nieuwe Diep, half a mile east, is the port at the main outlet of the North Holland Canal.

Helderberg Formation. In North America a division of the Silurian strata is called (after the Helderberg Range, in the east of New York state) the Lower Helderberg formation. It appears to be on the horizon of the English Ludlow beds. The Upper Helderberg formation of North America is a member of the Lower Devonian strata.

Helen, the most romantic figure of antiquity, famous for her beauty and the misfortunes that followed in her train. She was the daughter of Zeus and Leda, wife of the Spartan king Tyndareus, and owed her more than mortal loveliness to her divine origin. At the age of ten she was carried off by Theseus and Pirithous, but was soon recovered by her brothers Castor and Pollux, of whom the latter was half an immortal like herself. She was sought in marriage by all the noblest Greek princes, whom her father bound by an oath to respect the choice which Helen herself should make. She chose Menelaus, and bore to him the fair Hermione. When she was carried off by Paris, son of Priam of Troy, through the connivance of Aphrodite, Menelaus mustered all the Greek princes to revenge the wrong, and thus the famous ten years' Trojan war began. After the death of Paris, not long before the fall of the city, Helen was married to his brother Deiphobus, and she is said to have betrayed him to Menelaus and so regained her husband's love. With him she returned to Sparta, and there lived the rest of her life in quiet happiness. The pair were at last buried together at Therapnæ in Laconia, although, according to the prophecy of Proteus in the *Odyssey*, they were not to die, but to be translated to Elysium. Another story makes Helen survive Menelaus, and be driven out of the Peloponnesus by his sons. She fled to Rhodes, and was there tied to a tree and strangled by Polyxo—a crime expiated only by the Rhodians building a temple to her, under the name of *Helena Dendritis*. Yet another tradition makes her marry Achilles on the island of Leuce, and bear him a son, Euphorion.

In the Homeric poems Helen survives as the personification of all grace and loveliness. She is the daughter of Zeus, although there is no mention as yet of the swan story of her mother's wooing by the god. Into the conception of her character in the *Iliad* there enters but little sense of moral responsibility, perhaps because she is a personage that has come into history from the world of mythology, which is ever innocent of morals. In the *Odyssey*, again, we find an incipient sense of moral responsibility, the burden of which is, however, shifted from the shoulders of Helen on to those of some god (*Od.* xxiii. 222). It is true, however, that *Iliad* ii. 356 and 590 may fairly be interpreted to convey the meaning that Helen was carried away by force, an unwilling victim of Aphrodite. Still the fact remains that there exists a notable difference of tone about this question, and this is not unfairly advanced as one of their strongest arguments by those who claim a later date for the *Odyssey* than the *Iliad*. Others, again, contend that in the *Iliad* there is a no less distinct sense of moral responsibility, pointing out that in iii. 164 and vi. 357 there is blame distinctly imputed to the gods, and that in iii. 173–176 and vi. 344 Helen takes the burden of the guilt upon herself. Among her warmest apologists are Mr Gladstone and Mr Andrew Lang. Indeed the former makes bold to say that 'her self-abasing and self-renouncing humility come nearer, perhaps, than any other heathen example to the type of Christian penitence.'

Pausanias tells us that on the chest of Cypselus, a work of the 7th century B.C., Menelaus was represented as rushing on to kill Helen; and, according to a statement attributed to Stesichorus, the Achæan host were about to kill her when their hands were stayed by the power of her beauty. In his *Troades* Euripides makes Helen plead her cause to Menelaus with sophistical rhetoric; in the *Helena* he makes her remain in Egypt, the Greeks and Trojans fighting merely for a shadow formed by the gods out of cloud and wind. Again, in his *Cyclops* the giant speaks of Helen in a manner far removed from the high chivalry and tenderness of Priam and of Hector. In the *Æneid* we are invited to behold the hero about to slay Helen crouching in terror in the temple of Vesta, and only saved from this infamy by the inter-

position of Venus. 'Hundreds of years later,' says Mr Lang, 'Helen found a worthier poet in Quintus Smyrnæus, who in a later age sang the swan-song of Greek epic minstrelsy.' As the personification of all feminine loveliness, she was conjured up to play a part in the dream of Faust, whose words of wonder at the vision of her beauty in Marlowe's tragedy are almost worthy of their theme:

> Was this the face that launched a thousand ships,
> And burnt the topless towers of Ilium! . . .
> Oh, thou art fairer than the evening air
> Clad in the beauty of a thousand stars.

The loves of Faustus and Helen in the second part of Goethe's *Faust* typify the union of the classical and romantic spirit. She is its spiritual heroine throughout, and by his union with her in the fourth act Faust is raised infinitely rather than degraded in character. Last among the greater poets who have felt across the centuries the spell of Helen's loveliness are Walter Savage Landor and Tennyson; the former in some of the finest lines in his *Hellenics* commemorates the power of her beauty to disarm the anger of Menelaus; the latter has painted for us this 'daughter of the gods, divinely tall and most divinely fair,' in his splendid poem, *A Dream of Fair Women*. Poets and poetasters since have touched the theme, but deserve not even to be named together with these.

Helen will remain to posterity what she is in the *Iliad*, one of the most splendid creations in the whole world of art—a queen of beauty supreme over the human imagination, as she was when she went at the summons of Iris, all draped in silvery white, with her three maidens, to the walls of Troy. There above the gate sat the venerable King Priam among his counsellors, and all marvelled greatly at her beauty. 'No marvel is it that Trojans and Achæans suffer long and weary toils for such a woman, so wondrous like to the immortal goddesses' (*Iliad*, iii. 156–158).

See the delightful essay appended to Andrew Lang's fine poem, *Helen of Troy* (1882).

Helena (pronounced, contrary to the classical quantity, *Helē'na;* as is also the island *St Helena*), capital of Montana, is situated among foot-hills in the Prickly Pear Valley, about 14 miles from the Missouri River, with the Rocky Mountains rising behind the city to the south. It is the commercial and railway centre of the state, connected with the Manitoba and Northern Pacific railways, and by branch-lines with several mining camps. Many of the streets are wide and straight, shaded with rows of cottonwood-trees, and faced with handsome residences and business premises; and the city has now electric lights and horse-tramways. The most prominent building is the county court-house, containing the Montana government offices; there are also a government assay office, several churches, schools, and libraries, and a Catholic academy and convent, hospital, and asylum for the insane, besides quartz, flour, and lumber mills. A board of trade was organised in 1887. Gold was found here in July 1864, the first log-cabins were erected in September, and the camp was known as Last Chance Gulch until December, when it received its present name. Pop. (1880) 3624; (1890) 13,834.—There is another Helena in Arkansas; pop. 5185.

Hel'ena, the name of several female saints of the Catholic Church, the most celebrated of whom is the Empress Helena, wife of Constantius Chlorus, and mother of Constantine the Great. Whether born in Bithynia, Britain, or at Treves, she became a Christian during the youth of Constantine, but it was not till after the defeat of Maxentius that she formally received baptism. The few remaining years of her life she gave to works of benevolence. In 326, according to almost contemporary tradition, she visited Jerusalem, and there, with Bishop Macarius, discovered the Holy Sepulchre and the cross of Our Lord. Along with it were the crosses of the two thieves, but which was the true cross was shown by its touch restoring a sick lady to health. St Helena died, it is said, a nun, at the age of eighty. Her festival falls on 18th August. See CROSS, and works cited there.—Two other women of the same name are honoured as saints. The first, whose cult is confined to the Russian Church, was the wife of the Grand-duke Igor, and at her baptism in Constantinople (955) changed her original name, Olga, into Helena; the other was a native of West Gothland, and lived in the 12th century.

Helensburgh, a favourite watering-place of Scotland, in the county of Dumbarton, is pleasantly situated on the right bank of the Firth of Clyde, at the entrance to the Gareloch, 4 miles N. of Greenock by water, and 23 miles NW. of Glasgow by a railway opened in 1858, and extended to Fort William in 1894. It was founded in 1777 by Sir James Colquhoun, and named after his wife Helen. There is an obelisk to Henry Bell (q.v.). Pop. (1871) 5975; (1881) 7693; (1891) 8409; but in summer the numbers are nearly doubled.

Heliacal (Gr. *hēlios*, 'the sun'), emerging from the light of the sun or passing into it. A star's *heliacal rising* is when it rises just before the sun.

Heliand, the name of an Old Saxon poem, dating from the 9th century. Its subject is the life and work of Christ, constructed as a harmony of the four gospels. The poem is written in alliterative verse, in the spirit of the old Low German popular poetry. Besides being the most important relic of the Old Saxon dialect, it is not without intrinsic literary merit. Of two extant MSS. one is in the British Museum; the other is at Munich. Heyne has issued a critical edition of the text (3d ed. 1883), and there is a translation into modern High German by Simrock (3d ed. 1882).

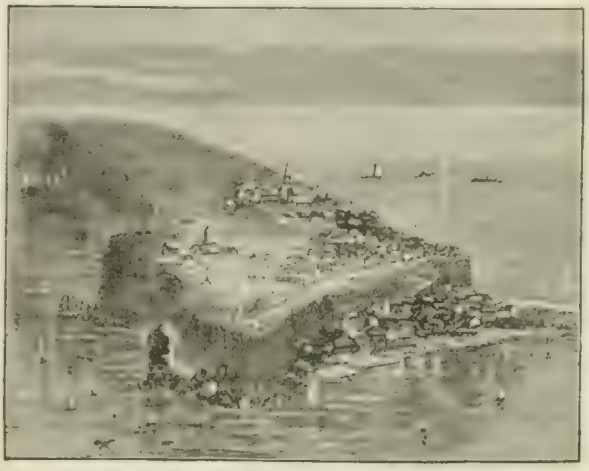
Helianthus. See JERUSALEM ARTICHOKE, and SUNFLOWER.

Helicidæ (Gr. *helix*, 'a spiral'), a large family of terrestrial air-breathing (pulmonate) gasteropods, of which Snails (q.v.) are familiar examples.

Helicon, a mountain-range (5736 feet) in the south-west of Bœotia, in ancient Greece, was celebrated as the favourite seat of the Muses. At the foot of the range stood the village of Ascra, the residence of Hesiod, and the seat of the earliest school of poetry in Greece. On the slopes were the famous fountains of Aganippe and Hippocrene, whose waters were reputed to give poetic inspiration.

Heligoland (Ger. *Helgoland;* native name, *det Lunn*, 'the Land'), a small island in the North Sea, belonging since 1890 to Germany, is situated about 36 miles NW. of the mouth of the Elbe, in 54° 11′ N. lat. and 7° 51′ E. long. It is about a mile long from north to south, and one-third of a mile from east to west, and three-fourths of a square mile in superficial area. The *Oberland* is a rock, 206 feet in height, on which stands a town of 400 houses, and access to which is obtained by 192 steps or by a steam-lift; while the *Unterland* is a patch of shore with 70 houses south-east of the cliff. The resident population was (1860) 2172, and (1890) 2086; though in the bathing season Heligoland is visited by upwards of 12,000 summer visitors—attracted by the admirable bathing facilities offered, not by Heligoland itself, but by the 'Sandy Island,' or *Düne*, a small sandbank with scrubby vegetation, separated from the main island by a channel about a mile wide. Sandy Island was

formerly connected by land, but the inroads of the sea have gradually isolated it. The same agent, together with the heavy rainfall, the variations in the weather, and the disintegrating power of the frost, is still reducing the size of Heligoland itself. The western cliff has, according to Lindemann, receded 7 feet in the forty years preceding 1888. The soil on the flat top of the rock of



Heligoland.

Heligoland suffices for a little pasture-land, and for growing potatoes and cabbages. There are some sheep on the island, and a few cows. Wheelbarrows are the only wheeled vehicles. The spit of the Unterland gives partial shelter to two harbours, one to the north, the other to the south. The inhabitants are supported chiefly by the lobster and other fisheries, and by the summer visitors, pilotage having almost ceased, and the public gaming-tables, established in 1830, having been suppressed in 1871. There is practically no poverty, disease, or crime, and the people are very long lived. A lighthouse stands on the cliff near the village. The island, which was taken by the British from the Danes in 1807, and was formally ceded to England in 1814, was ceded to Germany, 1st July 1890, in return for concessions made to Britain in East Africa. Heligolandish, a dialect of North Frisian, is the native tongue, but German is currently spoken. Steamboats run to and from the North Frisian islands of Sylt and Föhr, and Hamburg.—Heligoland was anciently sacred to the goddess Hertha. According to tradition, the island was once vastly larger, great tracts of country having been swallowed up by the sea between 700 A.D. and the end of the 17th century. Christianity was first preached here by St Willibrod in the 7th century, after whose time the island received its present name of Holy Land. The inhabitants of Heligoland are divided into two classes, differing both in race and occupation—the one being fishers, the other tradespeople, small shopkeepers, &c. The first are Frisians, a tall and muscular race of hardy seamen, simple and primitive in their habits, and holding land-labour and soldiers in contempt. The merchant class consists of immigrants from Hamburg and other places on the mainland, or their descendants. There is a curious and picturesque church, on the roof of which is still the Dannebrog painted by the Danish authorities when the island belonged to Denmark. The people, though they had been very loyal to Great Britain, accepted without opposition the annexation to Germany; and after a visit from the Emperor, Heligoland was formally incorporated with the kingdom of Prussia and the province of Sleswick Holstein. See Black's *Heligoland* (1888); German books by Lindemann (1889) and Lipsius (1892); and H. Gätke, *Heligoland as an Ornithological Observatory* (trans. 1895).—Under the early kings of Norway (10th century onwards) the name *Hedgeland* was given to a district north of Throndhjem, extending from about 65° N. lat. to the neighbourhood of Svartisen glacier.

Heliocentric, in Astronomy, having the sun (Gr. *helios*) as centre of reference; the heliocentric place of a planet being opposed to its *geocentric* (Gr. *gē*, 'earth'), its place as seen from the earth.

Heliodorus, the earliest and best of the Greek romance writers, was born at Emesa, in Syria. He was a sophist of the second half of the 3d century A.D., but has sometimes been confounded with a bishop of Trikka, in Thessaly (*circa* 390). The work by which he is known is entitled *Æthiopica*, in ten books, narrating in poetic prose, at times with almost epic beauty and simplicity, the loves of Theagenes and Chariclea. The work is distinguished from the later Greek romances by its vigour and its pure morality. See Rohde, *Der Griechische Roman* (1876). There are editions by Bekker (1855) and Hirschig in *Scriptores Erotici* (1856).

Heliogabalus, or ELAGABALUS, emperor of Rome, was born at Emesa in 204 A.D. His real name was Varius Avitus Bassianus, but having, when a mere child, been appointed high priest of the Syro-Phœnician sun-god Elagabal, he assumed the name of that deity. Soon after the death of his cousin Caracalla, Heliogabalus was proclaimed emperor by the soldiers, in opposition to the legitimate sovereign, Macrinus, who had become obnoxious to the troops from his parsimony and the severity of his discipline. The rivals met in battle on the borders of Syria and Phœnicia in 218 A.D. Macrinus was defeated, and Heliogabalus, proceeding to Rome, quietly assumed the purple. His reign, which lasted rather more than three years and nine months, was infamous for the gluttony and the nearly unparalleled debaucheries of every kind in which he indulged. He was murdered in an insurrection of the prætorians in 222 A.D., and was succeeded by his cousin and adopted son, Alexander Severus.

Heliography, a method of communicating swiftly between distant points by means of the sun's rays reflected from mirrors. Either successive flashes or obscurations of a continuous reflection of the sun's light may be combined so as to read like Morse's telegraphic system (see TELEGRAPH). Heliography may be used for geodetic measurement, or for military and other signalling. The instruments which contain the mirrors are variously called *heliograph* and *heliostat*. The instruments have been so perfectly contrived as to be available at a distance of over 190 miles (in California); French engineers in Algeria have found the signals serviceable at a distance of 170 miles. As early as the 11th century A.D. Algeria possessed a system of heliographs: 'At the summit of this tower was an apparatus of mirrors, corresponding to similar ones established in different directions, by aid of which one could communicate rapidly with all the towns from one end of the empire to the other' (*Athenæum*, 28th January 1882). Recently there has been a great development in heliography, or sun-telegraphy, for signalling messages between the sections of an army in the

field, as during the British campaign in Afghanistan in 1880. Drummond's and Begbie's heliostats, and the heliographs (differing in details) of Mance and Anderson, are favourably known. The name heliostat was originally used of an Equatorial (q.v.) revolving on its polar axis.—*Heliotrope* was the name given to a mirror placed at the distant station, and adjusted by clockwork, so that at a particular hour of the day (arranged beforehand) the light of the sun shall be reflected from the mirror directly to the surveyor's station. See SIGNALLING.

Heliogravure. See PHOTOGRAVURE.

Heliometer ('sun-measurer') is an instrument invented by Savery and Bouguer in 1743–48, by means of which the diameters of the heavenly bodies can be measured with great accuracy. As improved by Dollond, the object-lens of the instrument is in two halves, each of which will form a perfect image in the focus of the eyepiece; and the images may be made to diverge, coincide, or overlap each other, by varying the distance between the half-lenses. If the diameter of the sun is to be measured, the two lenses are adjusted so that the images may touch each other; then the distance between the centres of the two object-glasses measured in seconds gives the diameter of the sun. Fraunhofer made many remarkable improvements on the heliometer.

Heliopolis ('city of the sun'), the Greek name of the city called by the Egyptians On, An, stood on the east side of the Pelusiac branch of the Nile, near the apex of the Delta, and was one of the most ancient and important of Egyptian cities. It was the chief seat of the wisdom of the Egyptians, and Thales, Plato, and Solon are reported to have learnt from its priests. Manetho, the historiographer of Egypt, was chief-priest here, an office filled centuries earlier by the father-in-law of the Hebrew Joseph. One of the red granite obelisks long famous as Pharaoh's Needles is still standing near the hamlet of Matareieh, 8 miles N. of Cairo. It is 70 feet high, and bears the name of Usurtesen I., the second king of the twelfth dynasty. The obelisk called 'Cleopatra's needle,' brought in 1878 to England, and that taken to New York in 1880, were originally brought to Alexandria from this city. For the Syrian Heliopolis, see BAALBEK.

Helios, the Greek name of the sun (the Roman *Sol*), who was worshipped as a god. According to Homer, he was a son of the Titan Hyperion and of Theia, and a brother of Selene or Eos. He is described by the same poet as giving light both to gods and men. He rises in the east, from the marshy borders of Oceanus, into whose dark abysses he also sinks at evening. The later poets, however, gave him a splendid palace in the east, somewhere below Colchis, and describe him as being conveyed, after the termination of the burning labours of the day, in a winged boat of gold, along the northern coasts of the sea back to Colchis. After the time of Æschylus, he began to be identified with Apollo or Phœbus, but the identification was never complete. His worship was widely spread. He had temples in Corinth, Argos, Trœzene, Elis, and many other cities, but his principal seat was Rhodes, where a four-team was annually sacrificed to him. The island of Trinacria (Sicily) was also sacred to Helios, and here his daughters, Phœtusa and Lampetia, kept his flocks of sheep and oxen. It was customary to offer up white lambs or boars on his altars. The animals sacred to him were horses, wolves, cocks, and eagles.

Helioscope, a telescope for observing the sun without injury to the eyes, by means of blackened glass or mirrors that reflect only a part of the light.

Heliotrope (*Heliotropium*), a genus of plants of the natural order Boragineæ (q.v.); of the section, sometimes made a distinct order, Ehretiaceæ, the fruit separating only when ripe into four carpels. Many of the species have fragrant flowers. The Peruvian Heliotrope (*H. Peruvianum*), a shrub with oblong-lanceolate wrinkled

Common Heliotrope (*Heliotropium Europæum*).

leaves and small lilac-blue flowers, is in almost universal cultivation for its fragrance, which resembles that of vanilla or cherry-pie. Many seminal varieties of this species are cultivated in gardens. They delight in rich light soil, and are propagated by cuttings of the young growing shoots in a moist warm atmosphere. The European or Common Heliotrope (*H. Europæum*), a native of the south and west of Europe, is an annual with small white, or rarely pale red, flowers. Large quantities of the flowers are used by perfumers for making scents.—Classical fable accounts for the name heliotrope (Gr. *hēlios*, 'the sun,' and *trepō*, 'I turn') by representing Clytia as turned into this flower through gazing at Apollo.

Heliotrope, or BLOODSTONE, a variety of chalcedony or of jasper, of a green colour with red spots. The finest heliotropes consist of chalcedony, and are translucent, at least at the edges; the jasper bloodstones are opaque. Heliotrope is found in many parts of the world, as in Scotland, but the finest specimens of this mineral are brought from the southern parts of Asia. It was well known to the ancients, who obtained it chiefly from Ethiopia and Cyprus. It is much used for boxes, seals, &c.; and those specimens are most valued which possess most translucency, and in which the red spots are bright and well distributed. It was much used in the early ages of the Christian church for the engraving of sacred subjects, the figures being so managed that the red spots should represent drops of blood. The name heliotrope (Gr. *hēlios*, 'the sun;' *tropē*, 'a turning') seems to have been given to this mineral because when immersed in water in the face of the sun it was said to make the image of that luminary in it appear of a blood-red colour. The heliotrope, thus described by Pliny, must have shown very large spots or veins of red.

Heliotrope, an instrument. See HELIOGRAPHY.

Heliotropism ('turning towards the sun'). When a seedling plant is placed in a transparent vessel of water within reach of the light of a window, the stem and leaves gradually bend towards, and the

roots from the light. The former phenomenon is termed *positive*, and the latter *negative*, heliotropism. The shoots and leaves of nearly all plants turn towards the light, and the turning of the sunflower towards the sun is familiar to every one. In the case of organs which are positively heliotropic the growth of the side next the light is retarded, and that of the opposite side increased; the result of these combined actions is a concavity on the former, and a convexity on the latter, thus causing a curvature towards the light. In the case of roots these actions are reversed. That these results are brought about by the action of light is evident; the cells on the concave side become less, while those on the convex side become more, turgid, thus forcing the organ to bend; but the cause of turgescence is unknown.

Heliotype. See PHOTOGRAPHY.

Heliozoa, or 'sun animalcules,' a class of Protozoa of the Rhizopod type—i.e. provided with protruding processes of living matter. These processes are unlike those of the Amœbæ (q.v.) in being slender and radiant, unlike those of Foraminifera (q.v.) in being stable and rarely interlaced. The unit-mass or cell of which the Heliozoon consists is globular and stable, with one nucleus or with many, and usually with vacuoles both contractile and non-contractile. There is generally a 'skeleton,' gelatinous or siliceous, and in the latter case either continuous or composed of loose spicules. Multiplication is effected by division of the cell into two, or by budding, or by that internal fission known as spore-formation. In some cases the spores or young Heliozoa are flagellate, and thus very unlike the comparatively slow and passive adults. In a few instances Heliozoa have been seen united in colonies. The majority live in fresh water, but some are marine. Common examples are Actinosphærium, Actinophrys, Raphidiophrys, and Clathrulina. See PROTOZOA; Butschli's Protozoa in Bronn's *Thierreich*.

Helium. See ARGON, SUN.

Helix (Gr., 'a snail'), a term used for a genus of molluscs, including the land-snails; for part of the human ear (see EAR); and for a small volute or twist in the capital of a Corinthian column.

Hell, the place of torment, and the condition to which the finally impenitent are consigned after death, located by all the Fathers in the centre of the earth, although St Thomas says no one, without a special revelation on the point, can say where it is. Unfortunately for clearness of ideas on the subject the word has been from the beginning employed in the most various senses, and the confusion has been only deepened by the fact that in our Authorised Version it has been employed to render three wholly different words, Sheol or Hades, Gehenna, and once Tartarus (2 Peter, ii. 4). The word Sheol occurs in the Old Testament sixty-five times, and is rendered 'hell' thirty-one times, 'grave' thirty-one times, and 'pit' three times. Its original meaning seems strictly to have implied merely the shadowy under-world, a deep and gloomy cavern considered as the abode of the souls of the dead, the common receptacle for all mankind, not yet definitely differentiated into two distinct classes with the more rigorous logic of a later age and a fuller revelation. The Hebrew conception of Sheol was merely a kind of vague shadow of past life, in which the soul was shut off from any communion with the living, although we see in its loftier expressions of religious aspiration the impassioned desire for an unbroken continuity of union with God rising into a vision so vivid that it almost realises itself (Job, xiv. 13–15; cf. also Ps. xvi. 10, xlix. 15, lxxiii. 24). In these passages the Psalmists, in the heights of spiritual elevation and consciousness of living communion with God, leap in vision across the separating grave into a real conviction of living continuity of fellowship that rises into the region of true immortality; Job, in the perplexity of despair between his present calamities and the immediate expectation of death before God's favour is renewed to him, yet absorbed with the idea that God cannot belie himself by finally forgetting his righteous servant and his former fellowship, grasps the notion of immortality as a necessity of God's inherent righteousness, and thus reaches the loftiest spiritual conception of Christianity—a living union possible between man and God, by a process of pure religious abstraction.

The hope of a future life, in Old Testament prophecy, hardly extended beyond the perfected glory of the Israelitic theocracy under conditions which were essentially earthly, but yet already partly elevated into the supernatural. The condition of the dead continued to be represented as a shadowy existence in Sheol—an existence without special religious significance and value.

In post-exilic Judaism, on the contrary, the faith in the *resurrection* of the pious dead (in connection with the Messianic time of salvation) developed itself out of these two elements: (*a*) from the more individual conception of the covenant-relation and from the postulate of retribution in the kingdom of the Messiah, and (*b*) from the influences of the Persian faith in the resurrection, which co-operated with the former and furnished to them a definite form. While this faith, through the *Pharisees*, became a popular element of the Messianic hope, the *Sadducees* held fast to the old Hebrew conception of Sheol, and the *Essenes* assumed the Hellenistic doctrine of the incorporeal immortality of souls in a higher state of being, a doctrine which fitted in with the Essene spiritualism.

In consequence of this developed eschatology, there then entered also into the conception of Sheol the distinction of different moral retributive states: (*a*) for the righteous in *Paradise* or Abraham's bosom; (*b*) for the godless in *Gehenna*.

The Septuagint equivalent for Sheol is *Hades*, a word which occurs in the New Testament eleven times, and in ten of these is rendered 'hell,' the sole exception being 1 Cor. xv. 55. Again, 'hell' is used as the rendering for Gehenna twelve times. Originally as in the Old Testament usage the latter word simply signified the Valley of Hinnom near the city, which had been defiled by the abominations of human sacrifice in the Moloch worship of Ahaz and Manasseh. It became later a kind of receptacle for filth, the combustible portions of which, according to some authorities, were consumed with fire. Hence in later times it became an image of the place of punishment, 'where their worm dieth not, and the fire is not quenched.' The word Tophet occurs in the Old Testament nine times, and apparently meant originally a grove or garden in Hinnom; afterwards defiled and polluted by idolatries, it became to the Rabbis a fit symbol for all abominations, the very gate or pit of hell. Almost all the passages in which the term Gehenna occurs are hopelessly metaphorical in character, on which it seems unsafe to build too rigorous dogmatic definitions: in such investigations should never be forgotten the saving caution, 'Theologia parabolica non est demonstrativa.' No less difficult is the Greek word *aiônios* (*aiôn*, Hebrew *olam*), variously rendered by 'everlasting' and 'eternal.' It occurs seventy-one times in the New Testament, and in some of these cases it is certainly employed of periods limited in duration. The word *aiôn* does not necessarily connote what is understood by 'eternity' either in classical or Hellenistic Greek, and in the Oxford Library of the Fathers we find its adjective rendered very properly by 'secular.'

So that St Augustine's famous argument (*De Civ. Dei*, xxi. 23), besides its unworthiness, is strictly a *non sequitur*—that because *aiōnios zoē* is assumed to mean 'endless life,' therefore *aiōnios kolasis* must mean 'endless punishment.' As Haupt says, 'eternal life' is not to St John a mere term for unbroken continuance in being, as though it were simply equivalent to the indissoluble life (*zoē akatalutos*) of Heb. v. 6; it does not define the form of this life so much as the nature and meaning of it; *zoē aiōnios* is, in other words, a description of divine life, of the life which is in God, and which by God is communicated. At the same time the plain exegesis of the greater number of relevant passages in the New Testament points rather to *everlasting* than to merely *œonian* rewards and punishments, and indeed it is difficult to resist the conviction that such phrases as the *olethros aiōnios* ('destruction') of 1 Thess. v. 3, and 2 Thess. i. 9, and the *telos* of Philippians, iii. 19, refer to endless, hopeless, irremediable doom.

The same uncertainty is reproduced in the Authorised Version in the words used to express the fact of judgment passed upon the souls of men. The words *krino*, *krisis*, and *krima* occur in the New Testament some 190 times; the words *katakrinō*, *katakrisis*, *katakrima*, 24 times. In all but fifteen places these words are properly enough rendered by 'judge' and 'condemn,' and their derivatives; in the rest 'damn' and 'damnation' have been employed, sometimes as incongruously as in 1 Cor. xi. 29; 1 Tim. v. 12; and Rom. xiv. 23.

Enough has been said to show the difficulties in the exegesis of the passages on which the dogmas of the church about the future punishment of the impenitent are based, and it only remains to state here the chief views of eschatology now prevalent, and to sketch briefly the development of these in the history of dogma. It does not belong to us to discuss the abstract theory of future retribution—a postulate of all religions whether rudimentary or advanced—nor to attempt to justify anew the ways of God to man by distinguishing *ex cathedra* what is of faith and what is mere human speculation.

I. The orthodox theory, both in the Eastern and Western churches, is that at death there is passed upon every impenitent sinner an irreversible sentence to torture of both his moral and physical nature, endless in duration, and inconceivably dreadful in intensity, yet proportioned in degree to the depths of the iniquity of the individual, whose sufferings include within them both the 'pain of loss' and the 'pain of sense.' The former implies the remorseful consciousness of the loss of all good; the latter embraces all forms of physical torment, as by material fire, utter abandonment and alienation from God, and the perpetual society of lost men and devils. The pains of hell for ever without any mitigation or hope of escape are the fate of all whose faith during their life on earth has not come up to the minimum required by the rigorous justice of God. Such has been the orthodox belief of almost the entire Christian church until now, and its fathers and theologians, from St Augustine and St Thomas Aquinas down to Jeremy Taylor, Thomas Boston, and Jonathan Edwards, have lavished all the wealth of impassioned rhetoric upon the description of its horrors. Medieval painters like Orcagna devoted all the riches of a grotesque imagination to the portrayal of its material torments infinite in variety as well as awful in intensity, and the famous fresco in the Campo Santo at Pisa shows what a really great artist could make of such a theme. Indeed, the words which Dante saw in his vision above the gloomy portals of hell, 'All hope abandon ye who enter here,' merely describe with literal truth the traditional belief of the Christian church. St Augustine even found himself, in accordance with his views of predestination, compelled to postulate the eternal damnation of unbaptised infants. Although he is disposed to look upon this condemnation as *mitissima* and *tolerabilior*, he opposed the doctrine condemned by the synod of Carthage (419 A.D.) of an intermediate state in which unbaptised infants were said to be (*Limbus infantum*). Dante sees these hapless victims of fate in the first circle of the *Inferno*, and indeed this belief was held by the entire medieval church; while the eternal damnation of non-elect infants still stands implied in the famous Confession of Faith of the Westminster Divines. St Thomas Aquinas supposes that the bliss of the saved will be heightened by their witnessing the punishment of the wicked; and Jonathan Edwards thus expresses the same monstrous notion, 'the view of the misery of the damned will double the ardour of the love and gratitude of the saints in heaven.' To the Catholic the horrors of hell are enormously mitigated by the notion of an intermediate state of punitive probation, in which the souls of such as have not died in mortal sin are purged from the guilt of earthly sin, and made fit for translation to heaven to the companionship of God and his elect saints. See PURGATORY.

II. The second belief in importance is that associated with the great name of Origen, and variously termed Universalism, Restoration, or the Larger Hope—viz. that all men ultimately will be saved. Origen believed that the punishment of hell itself was but purgatorial in its character, that, its purifying effect once attained, the punishment would cease for all, most probably even for the devils themselves, and that the duration in each case would be proportioned to the guilt of the individual. This doctrine of the final restoration of all to the enjoyment of happiness is the theory of the *Apocatastasis* to which so many of the early Christian writers allude. It was taught definitely by Gregory of Nyssa, who foretells in glowing words a time when 'there shall no longer be a sinner in the universe, and the war between good and evil shall be ended, and the nature of evil shall pass into nothingness, and the divine and unmingled goodness shall embrace all intelligent existence.' Theodore of Mopsuestia teaches that in the world to come 'those who have done evil all their life long will be made worthy of the sweetness of the divine bounty. For never would Christ have said "until thou hast paid the uttermost farthing" unless it were possible for us to be cleansed when we have paid the penalty. Nor would he have spoken of the many stripes and few unless after men had borne the punishment of their sins they might afterwards hope for pardon.' Gregory of Nazianzus seems to have held the same opinion; and St Jerome, who does not accept it, at least treats it with respect, and adds 'human frailty cannot know the judgment of God, nor venture to form an opinion of the greatness and the measure of his punishment.' The Reformers followed Augustine except in so far as they rejected Purgatory, first taught distinctly in his treatise *De Doctrina Christiana*. Of theologians inclined to the wider hope it is enough to name Bengel, Henry More, Rothe, Neander, Tholuck, and Martensen; and among ourselves Maurice, Milman, Kingsley, Alford, Erskine of Linlathen, Thirlwall, Plumptre, and Farrar. The last has argued for the cause with equal learning and eloquence.

In close connection with the theory of universalism, as suggesting inferences all tending to the possibility of purification and educational discipline being mingled with the penalty for sin beyond the grave, is the much-debated question of the descent of Christ into hell to preach to the spirits

in prison. The earliest account of this as a historical fact is given by Eusebius, but it soon appears with fantastic elaboration in the apocryphal gospel of Nicodemus, and a statement of belief in it was inserted in the Apostles' Creed, in the earlier forms of which, however, it does not appear, any more than it does in the creeds of Irenæus, Origen, Tertullian, Cyprian, nor in that of the Council of Nice. Yet we find it distinctly taught by Ignatius, Hermas, Justin Martyr, Irenæus, Tertullian, Clement of Alexandria, Origen, Cyprian, Cyril, Ambrose, Jerome, Augustine, and Chrysostom. It was maintained in answer to Arian and Apollinarian heresies, as proving the true humanity and the real death of Christ. Besides 1 Peter, iii. 19, the other passages in Scripture considered to support this belief are Eph. iv. 9, and Acts, ii. 27–31. Tertullian asserts that heaven is not open till the end of the world, and that all men are in Hades, either comforted or tormented, and that the purpose of our Lord's descent was that the patriarchs should be made partakers of him. The belief soon came to be widely held that the patriarchs and prophets were in Hades, but passed with Christ into Paradise—the germ of the medieval doctrine of the *Limbus patrum*. Augustine seems to have believed that Christ's preaching was effective in saving some souls which were in torment. Cyril of Alexandria describes Christ as having by his descent 'spoiled Hades utterly, and thrown open to the spirits of those that slept the gates that none may escape from, and leaving the devil there in his solitude and desolation, having risen again.' To him it was the supremest proof of Christ's love to man that the Cross, the symbol of deliverance, had been raised in Hades itself. The theme early became a subject of Christian art, as the 'Harrowing of Hell' was a favourite subject of our own medieval writers of mysteries, and takes its place in the great *Divina Commedia* of Dante. The Reformers felt that the doctrine lent support to the dogma of Purgatory, and some, as Calvin, taught that the descent into Hades meant only the terrible anguish with which the soul of Christ was tried, equalling in its intensity for the time the sufferings of the damned, while others merely admitted the fact without allowing themselves to define anything as to its purpose or result. Hammond, Pearson, and Barrow maintain the only meaning of St Peter's words to be that our Lord by his Holy Spirit, inspiring Noah, preached to the disobedient antediluvians, who are now for their disobedience imprisoned in hell—an explanation that had already occurred to Jerome and Augustine. Bishop Harold Browne observes that on this subject Pearson has written less logically than is his wont, and says well that the real difficulty consists in the fact that the proclamation of the finishing of the great work of salvation is represented by St Peter as having been addressed to these antediluvian penitents, while no mention is made of the penitents of later ages, who are equally interested in the tidings. It can hardly be denied that the patristic interpretation is most in harmony with an honest exegesis of the passage in St Peter's epistle, but here it may be enough to summarise the opinions of two great Protestant theologians, Martensen and Dorner.

The former says that departed souls live a deep spiritual life, for the kingdom of the dead is a kingdom of subjectivity, of *remembrance* in the full sense of the word. At death the soul finds itself in a world of pure realities; the manifold voices of the world, which during this earthly life sounded together with the voices of eternity, grow dumb, and the holy voice now sounds alone, no longer deadened by the tumult of the world; and hence the realm of the dead becomes a realm of judgment. Departed spirits thus not only live and move in the elements of bliss or woe which they have formed and prepared for themselves in time, but they continue to receive and work out a new state of consciousness, because they continue spiritually to mould and govern themselves in relation to the *new* manifestation of the divine will now first presented to their view.

Of the famous passage of St Peter, Dorner says that Peter really contemplates Christ after his death, probably before his resurrection, as active in the region of the dead, and therefore not in the place of torment, but in the intermediate region. There is an Intermediate state before the decision of the Judgment. The Reformation, occupied chiefly with opposition to the Romish Purgatory, leaped over, as it were, the middle state—i.e. left at rest the questions presenting themselves here, gazing with unblenched eye only at the antithesis between the saved and the damned, on the supposition (retained without inquiry), in opposition to more ancient tradition, that every one's eternal lot is definitely decided with his departure from this present life. This is in keeping with the high estimation put on the moral worth of the earthly life. Nevertheless, the view is untenable, and that even on moral grounds. Not merely would nothing of essential importance remain for the Judgment if every one entered the place of his eternal destiny directly after death, but in that case also no space would be left for progressive growth of believers, who yet are not sinless at the moment of death. If they are conceived as holy directly after death, sanctification would be effected by separation from the body; the seat, therefore, of evil must be found in the body, and sanctification would be realised through a mere suffering of death as a physical process instead of through the will. Add to this that the absoluteness of Christianity demands that no one be judged before Christianity has been made accessible and brought home to him. But this is not the case in this life with millions of human beings, as the heathen in central Africa. Nay, even within the church there are periods and circles where the gospel does not really approach men as that which it is. Moreover, those dying in childhood have not been able to decide personally for Christianity. The passages which make the pious enter at once a better place exclude a Purgatory as a place of punishment or penance, but by no means exclude a growth in perfection and blessedness. Even the departed righteous are not quite perfect before the resurrection. Their souls must still long for the dominion of Christ and the consummation of God's kingdom. There is, therefore, a *status intermedius* even for believers, not an instantaneous passage into perfect blessedness.

How closely this touches the question of the admissibility of Prayers for the Dead will be at once apparent, although that subject hardly falls to be discussed here. It was an ancient pre-Christian custom to offer up prayers for the dead, and we early find traces of it in the Christian Church. These St Augustine thought might at least secure for the lost a *tolerabilior damnatio*.

III. Another view, not without its adherents, is that of Conditional Immortality or Annihilationalism, according to which final destruction and not endless suffering is the doom of the finally impenitent. It of course traverses the belief in the inherent immortality of the soul, the instinctive hope and belief of all mankind everywhere; and, if it saves the mind from the horror of endless torment, necessitates the belief that God will raise up the impenitent from the dead only to be tormented and at last destroyed. Its adherents depend for proof on the literal and assumed interpretation of

a few passages of Scripture, and count among its modern supporters Watts, Isaac Taylor, and Whately.

The principal theories of future retribution having thus been briefly sketched, it only remains to say a few words more generally upon the significance of New Testament eschatology, and the mode of its development; and here we shall follow closely in the track of Pfleiderer. The whole of the Primitive-Christian community lived in the expectation of the speedy return of Christ and the advent of his visible kingdom of glory upon earth. Further, the *Apocalypse* of John (following the Jewish apocalyptic—e.g. the *Book of Enoch*) distinguished between (1) the earthly kingdom of Christ (of limited duration—1000 years, hence *Chiliasm*), beginning with the Parousia and First Resurrection, and (2) the definitive end of the world (Rev. xx. 2–7) following thereupon, which, through a second general resurrection and judgment of the world, together with the annihilation of the kingdom of Satan, will introduce the eternal completion of the kingdom of God: which completion, moreover, the Apocalypse also still represents in accordance with the analogy of the Israelitish theocracy—descent of the heavenly Jerusalem (Rev. xxi.).

In the Pauline eschatology two essentially different views cross each other: (*a*) On the one hand, the specifically Jewish-Christian expectation (handed down in the Christian community) of the following miraculous catastrophes: Parousia, Earthly Reign of Christ, Resurrection of Christians, General Judgment (1 Cor. xv. 23–26; 1 Thess. iv. 13–18)—under the assumption of which the state of souls between death and resurrection appears as a middle state, like sleep; on the other hand (*b*) a result of the specifically Pauline doctrine of the Spirit of Christ—viz. the expectation of a glorified state of individual Christians in fellowship with Christ—a state already prepared in the life of the Christian on this side the grave, and therefore beginning immediately after death to unfold its fullness in the manifestation of a body-of-light (Rom. viii. 10 *et seq.*, and 17–23; 1 Cor. v. 1 *et seq.*; Phil. iii. 20 *et seq.*). The latter mode of conception appeared first in the later Pauline epistles, without however being made to harmonise with the first. The definitive end of the world Paul conceives as introduced by the subjugation of all the enemies of God, which is carried out under the earthly rule of Christ as king (whether through their conversion or even through their complete annihilation), and finally of even death itself. On this follows the surrender of the kingdom by Christ to God and the dominion of God alone in all creation, even to outward nature—glorified and serving God in freedom (1 Cor. xv. 27 *et seq.*; Rom. viii. 21).

The ideal tendency of the Pauline eschatology was strengthened from the side of Hellenism, under whose influence already the Epistle to the Hebrews had combined the future Messianic world of Jewish-Christianity with the higher, heavenly, or ideal world, and had immediately attached the perfect state to the death of the individual (Heb. xii. 23; iv. 9 *et seq.*; ix. 27).

In John the idealising spiritualisation of the traditional eschatology goes still further by transforming the *external* perfection (in the future) into the *internal* perfecting of the religious Christian life of the present church. As already the 'coming again' of Christ, in the valedictory discourses, wavers between future Parousia and present Coming-in-the-Spirit (John, xiv. 16), so also the 'eternal life' of believers has now already become realised in the present in their corporate unity with God and Christ, which is above death and judgment, and which receives no essential addition even through the future resurrection to life (which, withal, is here firmly adhered to). In like manner, also, Judgment realises itself already in the historical life of the community, continuously, in the process of separation betwixt faith and unbelief, sonship to God and to the Devil—which separation will find only its full outward manifestation in the future two-sided resurrection (John, xvii. 3; xi. 25 *et seq.*; vi. 40; v. 24 *et seq.*; iii. 17–21, 36; xvi. 8 *et seq.*).

In the spiritualisation of eschatology Origen only went further on the line pursued by the Gospel of John. The other Church Fathers in opposition to Gnostic spiritualism laid stress all the more decisively on the sensuous reality of the last things, even to the Pharisaic fleshly identity of the resurrection body with the earthly one. Only it must be noted that Chiliasm, as an apocalyptic hope for the future, was from the 3d century all the more decisively rejected by the church, the more its idea realised itself in the church's own dominion over the world, and the Parousia of Christ was pushed forward from the near future to the far-off distance.

The conception of the *Ignis Purgatorius*, derived from the Platonic doctrine of the purifying penances of souls in the world beyond the grave, was early adopted by individuals, but from the time of Gregory I. became a part of the Catholic Church's faith, closely connected with the Mass and with the church's penitential discipline, for which reasons it was rejected by Protestant orthodoxy, which makes the unchangeable and endless retributive states of salvation and damnation ensue immediately on the death of the individual, between which states there is no third, though different degrees within both are admitted. In no other respect does the Protestant eschatology differ from the Catholic. Chiliasm is rejected as a Jewish error; but the Parousia of Christ with general resurrection, judgment, and transformation of the world stands as the solemn close of time and entrance on eternity. In the further course of Protestant theology some more mystical thinkers have sought to vivify the abstract monotony of the world beyond the grave as conceived by the church (*a*) by adopting once more the biblical Chiliasm, now termed Millenarianism, or (*b*) by finding a compensation for purgatory in assuming the capability of conversion beyond the grave, or assuming a growing perfectibility, or assuming a general restoration of all men (*Apocatastasis*).

On the contrary the more rational theologians tended rather to set aside the last remains of the primitive Christian dogmas—Parousia and Resurrection, and to reduce this whole section of doctrine to the Alexandrine form of the incorporeal continuance of souls. Philosophic thinkers found the essential idea of Christian eschatology in the immanent eternity or infinity of the religious spirit; along with which the individual continuance of souls was denied by some (as in Schleiermacher's *Reden*; it is otherwise in his *Glaubenslehre*; and by the Hegelian Left), but asserted by others (as by Leibnitz, Wolff, Kant, Fichte, Schelling, the Hegelian Right, Krause, Herbart, Lotze, Teichmüller, &c.).

Theology holds almost exclusively to the latter side. The Christian faith has from the beginning combined the two fundamental forms of hope for the future: (*a*) the Hebrew, of hope for the *earthly* future perfection of the people of God, and (*b*) the Hellenistic, directed to the *supra-mundane* perfection of the individual soul. Each of the two represents an essential side of the Christian hope, and is conceivable without self-contradiction; it is only from the mixture of both sides, as it passed over from the Jewish theology into primitive Christianity, that obscurities and contradictions

arose. To set aside these and bring each of the two sides, the mundane and the supramundane, or the social and individual, hope of perfection to the clearest possible view appears to be the eschatological task of the theology of the present.

The primitive Christian faith in the return of Christ and the earthly erection of his kingdom includes the ideal of the earthly realisation of the kingdom of God, or of the extensive and intensive permeation of the Christian spirit throughout humanity, as the goal and task of the history of the world. It is in the union of all mankind in the family of the children of God and in the moralising of the whole life of society through the power of the Christian spirit that the victorious Coming and Royal Rule of Christ in the earthly world is constantly realising itself. But, because realising itself upon the foundation of the historical life of nations, it remains constantly bound to those conditions and limits which are historically human.

Christian faith hopes to find in the supramundane or heavenly future of the individual persons the completion of what is on earth but fragmentary, and the harmony of what is on earth discordant. This hope rests partly (*a*) on the consciousness of the independent super-sensuous reality of the personal life distinct from its sensuous organism; partly and especially (*b*) on the conviction of our faith that we are destined to perfect likeness to God and fellowship with God, and that this our destination is eternally founded in God, and therefore not to be set aside by any temporal contingency whatever.

Since the capacity for development which is inherent in the nature of the human soul cannot be removed with the death of the body, and since the eternity of the pains of hell may be considered neither psychologically thinkable nor consistent with the all-wise love of God, nor yet correspondent to the thought of 1 Cor. xv. 28, therefore the Protestant doctrine of the stability of the twofold state of departed souls must be transformed into the thought of an infinite variety of forms and stages of development beyond the grave in which there remains room for the infinite love to exercise endlessly its educative wisdom. Further, the unbiblical conception of a resurrection of the body of flesh is to be explained according to the spiritualised (1 Cor. xv. 44, also 50th verse) Pauline theory of resurrection bodies, in doing which the speculative theory of the body as the totality of ministering forces organised by the soul itself may be called to our aid.

For the rest, the true evangelical treatment of the 'last things' must follow the principle of biblical caution; and, instead of arbitrarily picturing to ourselves that which is unsearchable, we can content ourselves with the promise that we will be present with the Lord, and that the eternal blessed life, which is begun indeed already here below, but, under the endless suffering of the world, remains constantly incomplete, will at last reach perfection in the knowledge and love of God.

Eschatologie* (Leip. 1886); and Professor J. Agar Beet's series of papers in the *Expositor* for 1890.

Hellas. See Greece.

Hellebore, a name applied to two distinct genera of plants. The genus to which it more properly belongs, and to which it has belonged since very ancient times, Helleborus, is of the natural order Ranunculaceæ, and is characterised by a calyx of five persistent sepals, often resembling petals; a corolla of eight or ten very short, tubular, honey-secreting petals; numerous stamens and three to ten pistils; a leathery capsule, and seeds arranged in two rows. The species are perennial herbaceous plants, mostly European, generally with a short root-stock; the stem mostly leafless, or nearly so, but sometimes very leafy; the leaves more or less evergreen, lobed, the flowers terminal. A familiar example of this genus is the Black Hellebore—so called from the colour of its roots—or Christmas Rose (*H. niger*), a favourite in flower-gardens, because its large white flowers—which have in recent years been greatly improved by florists in point of size and purity of colour—are produced in winter. The leaves are all radical; the stalks generally one-flowered; the flowers white or tinged with red. Black hellebore formerly enjoyed a higher reputation as a medicinal agent than it now possesses. Melampus is represented as employing it in the treatment of madness centuries before the Christian era. The root is the part used in medicine, and it is imported into

Christmas Rose (*Helleborus niger*).

Britain from Hamburg, and sometimes from Marseilles. It consists of two parts—the rhizome or root-stock, and the fibres descending from it. The former is nearly half an inch thick, several inches long, and knotty, with transverse ridges and slight longitudinal striæ. The taste is slight at first, then bitter and acrid. It is not much employed at the present day, but it has been found of service (1) in mania, melancholia, and epilepsy; (2) as an emmenagogue; (3) in dropsy—its action as a drastic purgative, and its stimulating effect on the vessels of the liver, rendering it useful; (4) in chronic skin diseases; and (5) as an anthelmintic. Ten or fifteen grains of the powdered root act as a sharp purgative. The

tincture, which is obtained by maceration in spirit, is usually given when its action as an emmenagogue is required. In an excessive dose it acts as a narcotic acrid poison, and causes vomiting, purging, burning pain in the stomach and intestines, faintness, paralysis, and death.—Stinking Hellebore (*H. fœtidus*) grows on hills and mountains in the south and west of Europe, in some of the chalk districts of England, and in several places in Scotland. It has a very disagreeable smell, and green flowers somewhat tinged with purple. The stem is many-flowered and leafy.—Green Hellebore (*H. viridis*), also found in the chalk districts of England, has a leafy stem, with a few large greenish-yellow flowers. The celebrated hellebore of the ancients was probably a species peculiar to Greece and the Levant, *H. orientalis* or *H. officinalis*; all the species, however, have similar medicinal qualities. From the abundance of the plant around the city of Anticyra, hypochondriacal persons were said to need a visit to Anticyra.

White Hellebore (*Veratrum album*) belongs to the natural order Melanthaceæ. The genus has polygamous flowers, with six-leaved perianth, six stamens, three pistils cohering at the base, a three-horned capsule separating into three many-seeded follicles, and compressed seeds winged at the apex. White hellebore has a leafy stem, sometimes 4 feet high, ovate-oblong leaves, a long terminal compound panicle, and yellowish-white flowers. It abounds in the mountains of the centre and south of Europe, but is not found in Britain. The root was once much used in medicine, but now rarely, although it seems to act powerfully in some diseases. It is a very acrid and active poison. Its powder is used to destroy lice, and by gardeners for killing caterpillars. A decoction and ointment of it are sometimes used in itch and ringworm. Caution is necessary even in handling the powder of white hellebore, and very unpleasant effects ensue from its getting into the eyes or nose.—American Hellebore, or Swamp Hellebore (*V. viride*), known also as Indian Poke or Itch Weed, is frequent in damp grounds from Canada to Carolina. Its root has properties similar to those of white hellebore. These properties seem to depend chiefly on an alkaloid called Veratria (q.v.).

Hellenist (Gr. *Hellēnistēs*), one who adopts Greek customs and language; a name given especially to those among the Jews, and afterwards in the Christian church of Judea, who, either by birth or by residence, and by the adoption of the Greek language, manners, and usages, were regarded as Greeks—in opposition to the Hebrews properly so called, whether of Palestine or of the Dispersion, and to the Hellenes, or Greeks proper. They are called *Grecians* in the Authorised Version, *Grecian Jews* in the Revised Version, of the New Testament. They inevitably stood in a relation of rivalry, if not of antagonism to the Hebrews (see Acts, vi. 1, and ix. 29). It was among the Jews settled in Alexandria that the Hellenising tendency found its freest development; and it is to that city that we must refer the formation as well of that peculiar dialect of the Greek language which is known as the Hellenistic, as of that speculative philosophy which exercised so large an influence on those early Christian schools, of which Origen is the most famous exponent (see ALEXANDRIA).

The really characteristic element of the Hellenistic Greek consists in its foreign, and especially its Hebrew and Aramaic words and idioms. Although it was in its origin a purely popular form of the language, yet its being employed in the Alexandrian or Septuagint version of the Old Testament has given to it all the fixedness and definite character of a written language. The Hellenisms of the Septuagint differ in many respects from those of the New Testament, which again present some points of discrepancy with those of the Alexandrian Fathers; but there are certain leading characteristics common to them all.

The influence of the Hellenistic modes of thought on the Alexandrian philosophy will be traced under PHILO, NEOPLATONISM, PLOTINUS, &c.

See Winer, *Grammatik des N. T. Sprachidioms* (1822; 7th ed. 1867); Alex. Buttmann, *Gramm. des N. T. Sprachgebrauchs* (1859); S. A. Green, *Handbook to the Grammar of the Greek New Testament* (1885); W. H. Simcox, *On the Language of the New Testament* (1889); Dr Hatch, *Essays in Biblical Greek* (1889). There are dictionaries of New Testament Greek by Schleusner (1792), Robinson (Boston, 1836; New York, 1850), Cremer (1866; Eng. ed. by Urwick), D. Harting (2d ed. Utrecht, 1888); also Grimm's ed. of Wilke's *Clavis* (1868, and 1877–79; Eng. ed. by Professor Thayer). Concordances of the Greek New Testament are those by R. Young (1884), and Hastings and Hudson, as revised by E. Abbot (Boston, 1885).

Heller, STEPHEN, pianist and musical composer, was born on 15th May 1813 at Pesth, and made a brilliant début as a pianist when only nine years of age. Before he was sixteen he had played in most of the principal cities of Europe. From 1830, when he settled in Augsburg, he began to study composition. In 1838 he removed to Paris, where he occupied himself with composing and teaching until his death, on 13th January 1888. In the matter of technique he must be ranked beside Chopin. He wrote almost exclusively for the pianoforte; his works, which number about 150, consist of sonatas, études, &c., and are distinguished by originality and refinement. See his Life by Barbedette (Paris, 1876).

Hellespont. See DARDANELLES.

Hell Gate, or HURL GATE, named by the Dutch settlers of New York *Helle Gat*, is a pass in the East River, between New York city and Long Island, formerly very dangerous to vessels from its numerous rocks and rapid current. As early as 1851 attempts were made to blast away the obstructions; the operations which in 1885 finally freed the navigation are described, with an illustration, in the article BLASTING.

Hellin, a town of Spain, 69 miles by rail NNW. of Murcia. In the vicinity are productive sulphur-mines and sulphur-springs. Pop. 13,700.

Helm. See STEERING.

Helmet. See ARMOUR, HERALDRY.

Helmet-shell (*Cassis*), a genus of gasteropods, type of a family (Cassidæ), the members of which are somewhat whelk-like, and have thick, heavy shells, with bold ridges, a short spire and a long aperture, the outer lip toothed, the canal recurved. Numerous species, amounting to about fifty if we include closely allied genera such as Cassidaria, occur in the warmer seas. As the shells are made up of differently-coloured layers, they are much used for the manufacture of Cameos (q.v.). The species most used is the large Black Helmet (*C. madagascarensis*), sometimes almost a foot long, with a whitish outer and black inner layer.

Helmholtz, HERMANN VON, a very distinguished scientist, was born at Potsdam, 31st August 1821; he was ennobled by the Emperor of Germany in 1883. He was at first a surgeon in the army, then assistant in the Berlin Anatomical Museum, and was a professor of Physiology from 1849 at Konigsberg, from 1855 at Bonn, and from 1858 at Heidelberg. In 1871 he became professor of Physics in Berlin. Helmholtz is equally distinguished in physiology, in mathematics, and in experimental and mathematical

physics. His physiological works are principally connected with the eye, the ear, and the nervous system. Thus, we have his exhaustive treatise on Physiological Optics, his Specimen for the examination of the Retina, his Discourse on Human Vision, and various papers on the means of measuring small periods of time, and their application to find the rate of propagation of nerve-disturbances. Of a semi physical nature we have his Analysis of the Spectrum, his explanation of Vowel Sounds (*Klangfarbe der Vocalen*: see SOUND), and his papers on the Conservation of Energy with reference to Muscular Action. In physical science he is known by his paper on Conservation of Energy (*Ueber d. Erhaltung d. Kraft*, 1847, translated [badly] in Taylor's *Scientific Memoirs*, new series); by a popular lecture on the same subject (1854); by two memoirs in Crelle's *Journal*, on Vortex-motion in fluids, and on the Vibrations of Air in open pipes, &c., and by several researches into the development of electric current within a galvanic battery. His *Populare wissenschaftliche Vortrage* appeared in 1865 76 (Eng. trans. by Atkinson, with Introduction by Tyndall, 1881); his great work on *Die Lehre der Tonempfindungen* (Eng. trans. by Alex. J. Ellis, *The Sensations of Tone*) in 1862; his *Wissenschaftliche Abhandlungen* in 1881-83; and his *Reden und Vortrage* in 1884. He died 8th September 1894.

See Clerk-Maxwell in *Nature*, vol. xv.; Rücker in *Nature*, vol. li.; and Bezold's German monograph (1895).

Helminthology, that branch of Zoology which treats of worms, especially parasites.

Helmond, a town in the Netherlands, province of North Brabant, lies 23 miles NW. of Venlo by rail. There are manufactures of textiles, machinery, and iron. Pop. 9029.

Helmont, JEAN BAPTISTE VAN, Belgian chemist, was born at Brussels in 1577. At Louvain he studied medicine and its cognate sciences, but soon turned aside from them to throw himself into the movement known as mysticism, to study the works and practise the precepts of Thomas à Kempis and Johann Tauler. Then, falling in with the writings of Paracelsus, he came back to his first love, and began to study chemistry and natural philosophy. After spending several years in France, Switzerland, and England, in 1605 he returned to Amsterdam, married Margaret van Ranst, a noble lady of Brabant, and in 1609 settled down at his estate near Vilvorde, where he spent the remainder of his life in chemical investigations of various kinds. He died 30th December 1644. In spite of much theosophical mistiness and much alchemical error, Van Helmont is regarded by some historians of chemistry as the greatest chemist who preceded Lavoisier. He was the first to point out the imperative necessity for employing the balance in chemistry, and by its means showed, in many instances, the indestructibility of matter in chemical changes. He paid much attention to the study of gases, and is supposed to have been the first to apply the term *gases* to elastic aeriform fluids. Of these gases he distinguished several kinds. He was also the first to take the melting-point of ice and the boiling-point of water as standards for the measurement of temperature. It is in his works that the term *saturation* is first employed, to signify the combination of an acid with a base; and he was one of the earliest investigators of the chemistry of the fluids of the human body. Along with other physiologists of his day, he speculated much on the seat of the soul, which he placed in the stomach. An account of his contributions to the knowledge of chemistry will be found in the Histories of Chemistry by Kopp and Höfer. His works, entitled *Ortus Medicinæ*, were published by his son four years after his death, and frequently since then. See Rommelaere, *Études sur Van Helmont* (Brussels, 1868).

Helmstedt, a town of Germany, 24 miles by rail ESE. of Brunswick, was formerly famous for its Protestant university, founded by Julius, Duke of Brunswick, in 1574, and suppressed by Jerome Bonaparte in 1809. The university building (the Juleum), which still remains, the 12th-century church of St Stephen, and the Marienberg church are the most noteworthy edifices. Helmstedt grew up originally round the monastery (now in ruins) of St Ludger in the 9th century. Pop. 9800.

Helmund, or HELMAND, a river of Afghanistan, rises on the south slopes of the Hindu Kush, flows south-west, west, and north-west, and after a course of about 680 miles empties itself into the lake of Hamun or Seistan. See map at AFGHANISTAN.

Helobiæ, or MARSH LILIES, form one of the chief groups of Monocotyledons, and comprise the four orders Butomaceæ, Alismaceæ, Juncagineæ, and Hydrocharideæ.

Heloderm. See GILA MONSTER.

Héloïse. See ABELARD.

Helots were the lowest of the four classes into which the population of ancient Sparta was divided. They are generally supposed to have been the aboriginal population of the country, and to have been reduced to bondage by their Dorian conquerors, their numbers being swelled from time to time by the addition of peoples conquered in war. They belonged to the state, which alone had the power to set them at liberty; but they toiled for individual proprietors, and were bound to the soil—i.e. they could not be sold away from the place of their labour. They were the tillers of the land, for which they paid a rent to their masters; they served at the public meals, and were occupied on the public works. In war they fought as light troops, each freeborn Spartan (who bore heavy armour) being accompanied to battle by a number of them, sometimes as many as seven. On rare occasions they were equipped as heavy-armed soldiers. It is a matter of doubt whether after emancipation they could ever enjoy all the privileges of Spartan citizenship. They were treated with much severity by their masters, especially in the later ages of Sparta, and were subjected to degradation and indignities. They were whipped every year, to keep them in mind of their servile state; they were obliged to wear a distinctive dress (clothes of sheepskin and a cap of dog's-skin), and to intoxicate themselves as a warning to the Spartan youth; and when they multiplied to an alarming extent, they were often massacred with the most barbarous cruelty. On one occasion 2000 of them, who had behaved bravely in war, were encouraged to come forward for emancipation, and were then treacherously put to death. The Spartans organised, as often as necessity required, secret service companies (Gr. *crypteia*) of young men, who went abroad over the country armed with daggers, and both by night and day assassinated the Helots, selecting as their special victims the strongest and most vigorous of the race.

Helps, SIR ARTHUR, essayist and historian, was born at Streatham, Surrey, 10th July 1813. From Eton he passed to Trinity College, Cambridge, where he was thirty-first wrangler in 1835; but, what meant more, was admitted a member of the famous Society of the Apostles, among whom were Charles Buller, Maurice, Trench, Monckton Milnes, and Tennyson. On leaving the university he

became private secretary to Spring-Rice, then Chancellor of the Exchequer, and next to Lord Morpeth, the Irish secretary. On the fall of the Melbourne ministry he retired to enjoy twenty years of lettered leisure. In 1860 he was appointed Clerk to the Privy-council, and was in consequence much thrown into contact with the Queen, who, it is understood, set a high value upon his character and talents. He was employed to edit the *Principal Speeches and Addresses of the late Prince Consort* (1862), and the Queen's own *Leaves from a Journal of Our Life in the Highlands* (1868). He received the degree of D.C.L. from Oxford in 1864, was made C.B. in 1871, and K.C.B. in 1872. He died in London, after a few days' illness, 7th March 1875.

His first work was a series of aphorisms entitled *Thoughts in the Cloister and the Crowd*, published as early as 1835. The next, a work of more real consequence, was *Essays written in the Intervals of Business* (1841). Two worthless plays followed, then *The Claims of Labour* (1844), and *Friends in Council* (two series, 1847–59), an admirable series of discussions on social questions, thrown into a conversational form. The same familiar speakers (Milverton, Ellesmere, and Dunsford) reappeared in *Realmah* (1869), *Conversations on War and General Culture* (1871), and *Talk about Animals and their Masters* (1873). His strong interest in the question of slavery prompted his *Conquerors of the New World and their Bondsmen* (1848-52), and the greater work, *The Spanish Conquest in America* (4 vols. 1855-61). Out of his studies for this work grew his admirable biographies of *Las Casas* (1868), *Columbus* (1869), *Pizarro* (1869), and *Cortes* (1871). Other works are *Companions of my Solitude* (1850), *Casimir Maremma* (1870), *Brevia* (1871), *Thoughts upon Government* (1872), *Life and Labours of Thomas Brassey* (1872), and *Social Pressure* (1875).

Helps is one of the most suggestive and delightful of our later essayists, revealing everywhere acuteness, humour, a satire which gives no pain, and a quiet depth of moral feeling and sense of man's social responsibilities; while his style possesses in a rare degree the qualities of grace, clearness, and distinction.

Helsingborg, an ancient seaport of southern Sweden, 32 miles NW. of Malmö, on the Sound, opposite Elsinore (Dan. *Helsingör*). It is connected by branch-lines with the railway from Stockholm to Malmö. There are a good harbour, some fishing, and some trade (6500 vessels annually in and out). It figures several times in the wars between Sweden and Denmark. Pop. (1875) 9471; (1890) 20,410.

Helsingfors, a fortified seaport, capital of the grand-duchy of Finland, and after Cronstadt the most important naval station on the Baltic, is beautifully situated on a peninsula, surrounded by islands and rocky cliffs, in the Gulf of Finland, 191 miles W. from St Petersburg by sea and 256 by rail. A series of formidable batteries, called the fortifications of Sveaborg, and consisting of seven strongly-fortified islands and numerous islets belonging to Russia, protect the entrance to the harbour, and are of such strength, and so well appointed, as to warrant the application to them of the name of the Northern Gibraltar. The whole front presented by the successive works is more than a mile in length, and, besides the casemates for small-arms, the united fortresses mount about 300 guns or mortars, and are garrisoned by 12,000 men in war-time, there being only about 2000 men in time of peace. The harbour itself is further defended by two forts. Helsingfors is the largest and handsomest town of Finland; the broad streets intersect at right angles, and there are several fine parks and public squares. Of the public buildings the most striking are the house in which the diet meets, the senate-house, and the university buildings. There are also three very handsome churches. The university, removed hither from Abo in 1828, where it had been founded in 1640, comprises four faculties, and in 1888 had 45 professors, and 1703 students inscribed on the lists, of whom 12 were ladies, but of whom only 1002 were actually in residence. In connection with it are a library of 200,000 volumes, a hospital, a botanic garden, and a valuable observatory. Helsingfors is a favourite bathing-place, and attracts many visitors during summer from St Petersburg. The town carries on a considerable trade in Baltic produce; it exports chiefly timber, paper, and butter, and imports iron and steel goods, with machinery, fancy articles, colonial wares, &c. Pop. (1870) 32,113; (1889) 64,817; (1895) 73,820. with the garrison.

Helsingfors was founded by Gustavus I. of Sweden in the 16th century, but the site of the town was removed nearer the shore in 1639. In 1819 it became the capital of Finland. In August 1855, during the Crimean war, Sveaborg was bombarded for two days and nights by a section of the allied fleet, without any material impression being made upon the forts. Helsingfors has still many Swedish characteristics, the majority of the population being of Scandinavian origin, hence Swedish is the tongue generally spoken. The Finnish language, however, is beginning to assert itself.

Helst, Bartholomæus van der, a Dutch painter, was born (according to tradition) at Haarlem in 1613. He was joint-founder in 1654 of the painters' guild of St Luke at Amsterdam, where he lived, and where he died in 1670. He attained great celebrity as a portrait-painter. Some of his pictures seem to bear traces of Franz Hals's influence. One of his works at Amsterdam, a 'Muster of the Burgher Guard,' with thirty full-length figures, was pronounced by Sir Joshua Reynolds to be 'the first picture of portraits in the world.' His later creations are inferior in merit to the pieces painted before 1650. Numerous paintings by him exist in European galleries.

Helston, an old market-town and municipal borough of Cornwall, 10 miles WSW. of Falmouth. It was made a borough by King John in 1201; and from the reign of Edward I. to 1832 it sent two members to parliament, and one till 1885. It has long been noted for its *Furry* or *Flora Dance*, held on the 8th May. A branch-line from Gwinear Road was opened in 1887. Pop. (1891) 3198.

Helvella, a genus of fungi, of the class Ascomycetes (see Fungi), having the *pileus* turned downwards, lobed and folded, and the surface of the *hymenium* even. Some of the Helvellæ are edible, and much used in Germany.

Helvellyn, one of the highest mountains of England, in the west of Cumberland, between Keswick and Ambleside. It is 3118 feet high, is easy of ascent, and commands magnificent views.

Helvetia, a Swiss colony (founded 1856) in the Argentine Republic, in the Gran Chaco, 80 miles N. of Santa Fé. Pop. 2500.—For ancient Helvetia, see Helvetii, Switzerland. For the Helvetic Confessions, see Confessions of Faith; and for the Helvetic Republic, see Switzerland.

Helvetii, a Celtic people inhabiting, according to Cæsar, the region between the mountains of Jura on the west, the Rhone on the south, and the Rhine on the east and north, the region corresponding pretty closely with the western part of modern Switzerland. Their chief town was *Aventicum*, and they were divided into four *pagi* or cantons, of

which the most important was the *pagus Tigurinus*. They are first mentioned in the war with the Cimbri, but the chief event in their history is their attempted irruption into and conquest of southern Gaul, in which they were repulsed by Cæsar with frightful slaughter, 58 B.C. Fortunately we have the story in the terse but vivid narrative of Cæsar. They collected three months' provisions, burned down their twelve towns and 400 villages, and made a general rendezvous by Lake Leman in the spring of the year. Cæsar hastened to Geneva, destroyed the bridge, raised two legions in Cisalpine Gaul, and when the Helvetians sent delegates to demand a passage, delayed them until he had built a wall along the Rhone, 16 feet high and about 19 Roman miles in length, flanked with redoubts. After vainly attempting to pass this barrier, the Helvetii took another route, but were followed and defeated with terrible slaughter at Bibracte (*Autun*), and the remnant obliged to return to their own country, where they became subject to the Romans, who overawed all disaffection by the fortresses which they built, *Noviodunum*, *Vindonissa*, *Aventicum*. Of 368,000 who left their homes, including 92,000 fighting-men, only 110,000 are said to have returned. See SWITZERLAND.

Helvétius, CLAUDE ADRIEN, one of the French Encyclopædists, was of Swiss origin, and was born at Paris in 1715. He was trained for a financial career, and in 1738 was appointed to the lucrative office of farmer-general. But this post he quickly resigned for the situation of chamberlain to the queen's household. At this time he associated much with the French philosophers of the day, Diderot, D'Alembert, Holbach, and others. In 1751 he withdrew to a small estate at Voré (Le Perche), where he spent the most of his life in the education of his family, the improvement of his peasantry, and in literary labours. In 1758 appeared his celebrated work, *De l'Esprit*, in which, carrying out, as he thought, the work of Locke, he endeavoured to prove that sensation is the source of all intellectual activity, and that the grand lever of all human conduct is self-gratification. The book created an immense sensation. It was denounced by the doctors of the Sorbonne, and condemned by the parliament of Paris to be publicly burned. Everybody read it, and it was translated into the principal European tongues. Helvétius died at Paris, 26th December 1771, leaving behind him a work, *De l'Homme, de ses Facultés, et de son Education* (2 vols. Lond. 1772). His collected works were published in 14 vols. at Paris in 1796, and again in 3 vols. in 1818. See Morley's *Diderot and the Encyclopædists* (1878).

Helvoetsluys, or HELLEVOETSLUIS, a fortified seaport of South Holland, on the Haring-Vliet, an arm of the Maas, 17 miles SW. of Rotterdam. It has an excellent harbour, and is to Rotterdam and the mouth of the Maas what the Helder is to Amsterdam and the Zuider Zee. There is a school of navigation. Here William III. embarked for England, November 11, 1688. Pop. 4362.

Hemans, FELICIA DOROTHEA, poetess, was born at Liverpool, 25th September 1793. Her father, George Browne, was a Liverpool merchant, of Irish extraction; her mother, whose maiden name was Wagner, was of mixed Italian and German descent. Felicia was distinguished for her beauty and precocity, and at an early age she manifested a taste for poetry, in which she was encouraged by her mother. Family reverses led to the removal of the Brownes to Wales, where the young poetess imbibed a strong passion for nature, read books of chronicle and romance, and gained a working knowledge of the German, Italian, Spanish, and Portuguese languages. She also cultivated her excellent musical taste. Her first volume was published in 1808, when she was only fifteen years of age, and contained a few pieces written about four years earlier; her second, entitled *The Domestic Affections*, appeared in 1812. In the same year she married Captain Hemans of the 4th Regiment, whose health had suffered in the retreat on Corunna, and afterwards in the Walcheren expedition, and who settled in Italy in 1818. After this time they never met again; their marriage was understood not to have been happy. Mrs Hemans, though in poor health, now devoted herself to the education of her children, to reading and writing, and spent the rest of her life in North Wales, Lancashire, and latterly at Dublin, where she died, 16th May 1835. Her principal works are: *The Vespers of Palermo*, a tragedy (1823), which proved a failure when acted at Covent Garden; *The Siege of Valencia, The Last Constantine, and other Poems* (1823); *The Forest Sanctuary* (1827); *Records of Women* (1828); *The Songs of the Affections* (1830); and *Hymns for Childhood, National Lyrics and Songs for Music* (1834); and *Scenes and Hymns of Life* (1834). A volume of *Poetical Remains* was published after her death, and subsequently a complete edition of her works, with a memoir by her sister, was issued in 7 vols. (1839). During a visit that she paid to Abbotsford, Scott complimented her on her musical talents: 'I should say you had too many gifts, Mrs Hemans, were they not all made to give pleasure to those around you.' And on parting he said: 'There are some whom we meet and should like ever after to claim as kith and kin; and you are one of these.'

Mrs Hemans, without great originality or force, is yet sweet, natural, and pleasing. But she was too fluent, and wrote much and hastily; her lyrics are her best productions; her more ambitious poems, especially her tragedies, being, in fact, quite insipid. Still, she was a woman of true genius, though her range was circumscribed, and some of her little lyrics, *The Voice of Spring*, *The Better Land*, *The Graves of a Household*, *The Treasures of the Deep*, and *The Homes of England*, are perfect in pathos and sentiment, and will live as long as the English language. These are found in almost every school collection, and this early familiarity with her sweet and simple lyrics has helped to keep her memory green.

Besides her sister's memoir, there are *Memorials* by H. F. Chorley (1836); *Recollections* by Mrs Lawrence (1836); *Poetical Remains*, with memoir by Delta (1836); and *Poetical Works*, with memoir by W. M. Rossetti (1873). See also Espinasse's *Lancashire Worthies* (1874).

Hematite. See HÆMATITE.

Hemel Hempstead, a market town of Hertfordshire, 23 miles NW. of London, a centre of the straw-plaiting industry. It has also paper-mills, iron-foundries, tanneries, and breweries. Pop. of parish (1851) 7073; (1891) 9678.

Hemerocallis. See DAY-LILY.

Hemianopia (Gr. *hemi*, 'one-half,' *an*, 'not,' and *ops*, 'the eye'), vision limited to one-half of an object—a peculiar and rare form of disease, generally due to disease within the brain.

Hemicrania. See HEADACHE.

Hemidesmus. See SARSAPARILLA.

Hemiplegia (Gr. *hemi*, 'one-half,' and *plēssō*, 'I strike'), Paralysis (q.v.) limited to one side of the face and body, and usually depending upon disease of the brain. Opposed in signification to Paraplegia.

Hemipode. See QUAIL.

Hemip'tera (Gr., 'half-winged'), a large order of insects, to which the general term 'bugs' is often

applied, or the more modern title Rhynchota, in allusion to the characteristic suctorial proboscis. The order includes (1) forms with similar wings (Homoptera)—e.g. coccus insects, aphides, Cicadas (q.v.); (2) others with dissimilar wings (Heteroptera)—e.g. water-bugs, water-scorpions; and (3) parasites or Lice (q.v.).

Hemlock (*Conium*), a genus of plants of the natural order Umbelliferæ, having compound umbels of small white flowers, small general and partial involucres, the limb of the calyx merely rudimentary, and a compressed ovate fruit with five prominent wavy ridges and no *vittæ*. The best-known and only important species is the Common

Flowers and Root of Common Hemlock (*Conium maculatum*): *c*, a flower; *d*, a seed.

or Spotted Hemlock (*C. maculatum*), which grows by waysides, on heaps of rubbish, and in other similar situations in Britain and on the continent of Europe, in some parts of Asia, and now also as a naturalised plant in North America and in Chili. It has a root somewhat resembling a small parsnip; a round, branched, hollow, bright-green stem, 2 to 7 feet high, generally spotted with dark purple; the leaves large, tripinnate, of a dark shining green colour; the leaflets lanceolate, pinnatifid. All parts of the plant are perfectly destitute of hairs, and it is the only British species of the order Umbelliferæ which has the stem smooth and spotted with purple. Both the general and partial umbels have many rays. The general involucres consist of several small leaflets, the partial involucres of three small leaflets, all on one side. The whole plant has a nauseous smell, particularly if rubbed or bruised. The leaves and fruit are the parts of the plant employed in medicine. The former should be gathered just before the time or at the commencement of flowering, and after the removal of the larger stalks they should be quickly dried by a heat not exceeding 120°. They should then be preserved in perfectly closed tin canisters. The fruit is gathered when fully developed, but still green, and should be carefully dried.

The most important ingredient in hemlock is the alkaloid conine, a volatile, colourless, oily, strongly alkaline substance, $C_8H_{17}N$, but it also contains two other alkaloids—methylconine and conhydrine. The fruit contains about one-fifth per cent. of it, the other parts of the plant merely traces. It is obtained by distilling the seeds with water which contains a little potash in solution; the conine passes over with the water in the form of a yellowish oil, and is purified by redistillation. Conine has lately been prepared artificially by Schiff. Conhydrine, $C_8H_{17}NO$, is a solid volatile alkaloid, and is much less poisonous than conine. Conine and methylconine are extremely poisonous, and cause death by their action on the nervous system. The action of conium depends of course on the combined effects of the active principles contained in the plant. The symptoms of conium poisoning are weakness and staggering gait, passing on to paralysis, which gradually passes up the cord until it reaches the respiratory centre, when death ensues. Dilatation of the pupil, ptosis, and asphyxial convulsions are symptoms also seen.

In medicine, it is given internally as a sedative to the nervous system in chorea, incontinence of urine, paralysis agitans, and other affections. It is also employed as a vapour to relieve cough. It may be administered internally in the form of powder (of the leaves), succus, tincture, or extract, while externally it may be applied as a soothing application to ulcers, painful piles, &c., in the form of ointment or poultice. The succus is considered the best preparation, the others often containing no active principle.

In cases of poisoning by hemlock, the evacuation of the stomach is the first thing to be attended to. Among the ancient Greeks, poisoning by hemlock was a common mode of death for condemned criminals, and thus it was that Socrates died.—Water Hemlock, or Cowbane (*Cicūta virosa*), is also an umbelliferous plant, of a genus having much-vaulted umbels, a five-toothed calyx, and almost globose fruit, each carpel with five broad flattened ribs and evident single *vittæ*. Water hemlock grows in ditches, on the margins of ponds, and wet grounds in Europe and the north of Asia. It is more common in Scotland than in England. It has a large fleshy white root, covered externally with fibres; an erect much-branched stem, 2 to 5 feet high; tripinnate leaves, with linear-lanceolate regularly and sharply serrated leaflets; no general involucre, or only a single small leaflet, partial

Water Hemlock (*Cicūta virosa*).

involucres of many short narrow leaflets; and white flowers. It contains an active principle, *Cicutoxine*, and an essential oil. It causes tetanic spasms, insensibility, vomiting, and diarrhœa. Fatal results have occurred from eating the root. Another species, *C. maculata*, is common in North America, growing in marshy places. It has a spotted stem, like that of true hemlock, the name of which it very generally receives in North America. The leaves are triternate, the leaflets ternate. It is a very poisonous plant, and is the cause of many deaths.—The *Cicuta* of the Romans was the *Conium* of modern botanists (Gr. *konneion*), as water hemlock does not grow in Italy or Greece.

The ornamental plant, the so-called Giant Hemlock, which in good rich soil reaches a height of 12 to 15 feet in three months, is not really a hemlock at all, but a giant Cow-parsnip (q.v.).

Hemlock Spruce. See FIR.

Hemorrhage. See BLEEDING.

Hemp (*Cannabis*), a genus of plants of the natural order Cannabinaceæ (q.v.), having the male and female flowers on different plants: the male flowers with five-partite calyx and five stamens; the female flowers with a spathe-like calyx of one leaf, rolled round the ovary and partially split along one side, and two threadlike stigmas. There is only one known species (*C. sativa*), varying considerably, however, from soil, climate, and cultivation. It is an annual plant, a native of the warmer parts of Asia, but has been cultivated in Europe from the earliest historic times, and is now naturalised in many parts of Europe and America. Like flax, it adapts itself wonderfully to diversities of climate, and is cultivated equally under the burning sun of the tropics and in the northern parts of Russia.

Common Hemp (*Cannabis sativa*), male plant.

It is, however, readily injured by frost, particularly when young; and in many countries where it is cultivated it succeeds only because the warmth of the summer, though of short duration, is sufficient for its whole life. Hemp varies very much in height, according to the soil and climate, being sometimes only 3 or 4 feet, and sometimes 15 or 20 feet, or even more. Notwithstanding the coarseness of its leaves, it is an elegant plant, and is sometimes sown on this account in shrubberies and large flower-borders. The stem is erect, more or less branched; the leaves are five to nine fingered. The flowers are yellowish-green, small, and numerous; the male flowers in axillary racemes on the upper parts of the plant; the female flowers in short axillary and rather crowded spikes. The female plants are higher and stronger than the male. The stem of hemp is hollow, or only filled with a soft pith. This pith is surrounded by a tender, brittle substance, consisting chiefly of cellular tissue, with some woody fibre, which is called the *reed*, *boon*, or *shove* of hemp. Over this is the thin bark, composed chiefly of fibres extending in a parallel direction along the stalk, with an outer membrane or cuticle.

Hemp is cultivated for its fibre in almost all countries of Europe, and in many other temperate parts of the world, most extensively in Poland, and in the centre and south of European Russia, which are the chief hemp-exporting countries. French hemp is much esteemed in the market, as is also that of England and Ireland, of which, however, the quantity is comparatively inconsiderable. *Bolognese Hemp* and *Rhenish Hemp* are varieties remarkable for their height; and a fibre of very fine quality, 8 or 9 feet long, is known in commerce by the name of *Italian Garden Hemp*. In the United States most of the hemp is grown in Kentucky. In England the cultivation of hemp is almost confined to Lincolnshire, Holderness in Yorkshire, and a few other districts, of which the moist alluvial soil is particularly suited to it. In cultivating hemp it is very necessary to have the soil so rich, and to sow the seed at such a season, that the plants shall grow rapidly at first, as they thus form long fibres. A crop of short scrubby hemp is almost worthless. The finer kinds of hemp are used for making cloth, the coarser for sailcloth and ropes. Hemp sown thin produces a coarser fibre than hemp sown thick. Something also depends on the time of pulling, for the crop is pulled by the hand. When a rather fine fibre is wanted, and the seed is not regarded, the whole crop is pulled at once, soon after flowering; otherwise, it is usual to pull the male plants as soon as they have shed their pollen, and to leave the female plants to ripen their seed, in which case the fibre of the female plants is much coarser. The treatment of hemp by *retting*, &c. is similar to that of Flax (q.v.). The fibre of hemp is generally used for coarser purposes than that of flax, particularly for sailcloth, pack-sheet, ropes, and the caulking of ships.

Common Hemp, female plant.

The seed of hemp is produced in great abundance. It is commonly sold as food for cage-birds; and birds are so fond of it that not only the ripening fields, but the newly-sown fields, must be carefully guarded against their depredations. A fixed oil, *oil of hempseed*, is obtained from it by expression, which is at first greenish-yellow and afterwards yellow, and has an acrid odour, but a mild taste. This oil is used in Russia for burning in lamps, although the wick is apt to get clogged, also for making paints, varnish, and a kind of soft soap.

Hemp is cultivated in warm countries not so much for its fibre as for a resinous secretion, which has narcotic or intoxicating qualities (see HASHISH). Hemp is also used as a therapeutic agent under the name of Indian Hemp, or Bhang, and may be administered in the form of resinous extract or of tincture; and it is usually prescribed (like opium) for its hypnotic, anodyne, and antispasmodic properties. Although less certain in its action than opium, it possesses these advantages over that drug—that it does not constipate the

bowels, create nausea, or check the secretions, and that it is less likely to occasion headache.

The name Hemp (Ger. *Hanf*) is from the Greek and Latin *cannabis*, and that from Sanskrit *ganja*. The name hemp is often extended with some distinctive prefix to many of the fibres used for ropes and coarse fabrics—Sunn Hemp, Manilla Hemp, Deccan Hemp, Sisal Hemp, &c. See APOCYNACEÆ, BOWSTRING HEMP, FIBROUS SUBSTANCES.

Hemp Palm (*Chamærops excelsa*; see CHAMÆROPS), a palm of China and Japan, the fibre of the leaves of which is much employed in those countries for making cordage. Hats are also made of its leaves, and even cloaks and other garments for wet weather.

Hems, HOMS, or HUMS (Lat. *Emesa*), a city of Syria, is situated near the right bank of the Orontes, 63 miles NE. of Tripoli. It is surrounded by ancient walls, now greatly ruined, and is entered by six gates. Its streets are narrow and dirty, and its houses mean. In ancient times it was chiefly celebrated for its temple of the Sun, now destroyed, though probably its site is occupied by the dilapidated castle or fortress, ruined by Ibrahim Pasha in 1831. One of the priests of this temple, Heliogabalus, was raised to the imperial throne of Rome in 218. Under the walls of Hems (Emesa) Zenobia was defeated by the Emperor Aurelian in 272. In 636 the city was taken by the Saracens, when its old Semitic name Hems was revived; and in 1098 it fell into the hands of the Crusaders. It has a considerable trade in oil, cotton, and sesame, and produces, besides these commodities, silk goods and gold wares. Pop. about 20,000.

Hemsterhuis, TIBERIUS, Dutch philologist, was born at Groningen, 1st February 1685. He became professor of Greek at Franeker in 1720, and of Greek history at Leyden in 1740, where he died 7th April 1766. One of the greatest Greek scholars of his time, Hemsterhuis may be said to have created a new school of Greek philology, to which belong his distinguished pupils Ruhnken and Valckenaer. His editions of the *Onomasticon* of Pollux (1706), of the *Select Dialogues* of Lucian (1708 and 1732), and of the *Plutus* of Aristophanes (1744, by Schäfer 1811) are his principal literary works. A beautiful picture of his life is given in Ruhnken's *Elogium Hemsterhusii* (1768 and 1789), republished in Lindemann's *Vitæ duumvirorum T. Hemsterhusii et D. Ruhnkenii* (Leip. 1822). From Hemsterhuis's MSS. *Anecdota Hemsterhusiana* (1825) have been edited by Geel, and *Orationes et Epistolæ* (1839) by Friedemann.

Hen. See POULTRY.

Henbane (*Hyoscyamus*), a genus of plants of the natural order Solanaceæ, having a five-toothed calyx, an irregular, funnel-shaped corolla, and a capsule opening by a lid and enclosed in the hardened calyx. The species are mostly annual and biennial herbaceous plants, and natives of the countries near the Mediterranean Sea. The only species found in Britain is the Common Henbane (*H. niger*), which is not uncommon in waste places and in the neighbourhood of towns and villages, particularly in calcareous soils, and on the sandy shores of Scotland. It is an annual plant, somewhat bushy, about 2 feet high, with large sinuated or sharply-lobed leaves without leaf-stalks, and large dingy yellow flowers with purplish veins. The whole plant is covered with unctuous hairs, and has a nauseous smell, which gives warning of its strong narcotic poisonous quality. Cases of poisoning by henbane are, however, not rare, but are more frequently owing to the proceedings of quacks than to any mistake of the plant for an esculent.

The seeds contain in largest quantity the peculiar alkaloid on which the properties of the plant chiefly depend, *Hyoscyamia* or *Hyoscyamin*, which crystallises in stellated acicular crystals of a silky lustre.

Henbane (*Hyoscyamus niger*).

The symptoms of poisoning by henbane are similar to those produced by other narcotic poisons, and the proper treatment is the same as in cases of poisoning by opium. In medicine henbane is employed both externally and internally. The leaves are the part commonly used; they are gathered and quickly dried when the plant is in full flower. Fomentations of henbane are applied to painful glandular swellings, parts affected with neuralgia, &c., and are often found to afford relief. An extract of henbane is sometimes employed instead of belladonna to dilate the pupil of the eye. Tincture and extract of henbane are often administered in cases of annoying cough, spasmodic asthma, and other diseases requiring sedatives and antispasmodics. Henbane is also employed to calm mental irritation and to induce sleep. For many cases it has one great advantage over laudanum, in not producing constipation. The smoke from the burning seeds of henbane is sometimes introduced into a carious tooth to relieve toothache.

The other species of henbane possess similar properties. The dried stalks of *H. albus* are used by smoking in Greece to allay toothache.

Henderson, capital of Henderson county, Kentucky, on the Ohio, 10 miles S. of Evansville by rail, with nearly a score of tobacco-factories and warehouses, and a number of mills. Pop. 5365.

Henderson, ALEXANDER, a famous Scottish ecclesiastic, born in 1583, and educated at St Andrews, where in 1610 he was placed in the chair of Rhetoric and Philosophy, being soon after presented by Archbishop Gladstanes to the living of Leuchars, in Fife. Although the nominee of a prelate, he soon embraced the popular cause, and became one of its foremost leaders. He is supposed to have had a great share in drawing up the *National Covenant;* he withstood to the face the lukewarm theologians of Aberdeen, and was unanimously placed in the moderator's chair at the memorable General Assembly at Glasgow in November 1638, which in the face of the king's commissioner restored all its liberties to the Kirk of Scotland. In all the tortuous negotiations with the king Henderson took a principal part, and had many interviews with him. He was moderator at Edinburgh in 1641, and again in August 1643, and drafted the famous *Solemn League and Covenant*.

which was soon adopted also by the English parliament. Henderson was one of the Scottish commissioners that sat in the Assembly of Divines at Westminster, and in its work spent his last three years in England. He died at Edinburgh, 19th August 1646, and was buried in Greyfriars' Churchyard. See the Lives by Aiton (1836) and M'Crie (1846), and Baillie's *Letters and Journals*.

Hendricks, Thomas Andrews, vice president of the United States, was born in Ohio, 7th September 1819, and admitted to the Indiana bar in 1843. He served one term in the state legislature, sat in congress from 1851 to 1855, and in the United States senate from 1863 to 1869, and in 1872 was elected governor of Indiana. In 1876 he was the Democratic candidate for the vice presidency, but was not returned (see Hayes, R. B.); in 1884 he was elected. He died 25th November 1885.

Henequen, or Sisal Hemp. See Fibrous Substances.

Hengist (A.S. 'stallion') and **Horsa,** the names of the two brothers who led the first band of Teutonic invaders to Britain. They are mentioned by Nennius and the *Anglo-Saxon Chronicle*, so that we need not insist upon the suspicious etymologies of the names so far as to dismiss their story as a myth. According to the story they came about the year 449 to help King Vortigern against the Picts, and were rewarded for their services with a gift of the Isle of Thanet. Soon after they turned against Vortigern, but were defeated at Aylesford, where Horsa was slain. Ere long, however, Hengist is said to have conquered the whole of Kent.

Hengstenberg, Ernst Wilhelm, a famous German champion of orthodox theology, was born 20th October 1802, at Fröndenberg, in Westphalia, where his father was clergyman. Prepared by his father for the university, he devoted himself at Bonn chiefly to Orientalia and philosophy, whilst at the same time he took an enthusiastic part in the *Burschenschaften*. At first a sympathiser with rationalism, at Basel, whither he went in 1823, he passed over to the opposite extreme, and going next year as *privat-docent* to Berlin, soon put himself at the head of a rising orthodox party, whose principles he championed vigorously both in the university and through the press. In 1826 he was made extra-ordinary, in 1828 ordinary professor; and in 1829 doctor of theology. His *Evangelische Kirchenzeitung*, begun in 1827, combated rationalism even in its mildest forms, seeking to restore the orthodoxy and church discipline of the 16th and 17th centuries. All his works were devoted to the defence of the old interpretation and criticism of the Scriptures against the results of modern biblical science in Germany. Hengstenberg's great influence in ecclesiastical matters was employed in the carrying out of the high Lutheran dogmas of the church, of church-offices, and of the sacraments, by persecution of sectaries, by opposition to the union of Lutherans and Reformed, and by attempts to depose from their chairs Gesenius, Wegscheider, De Wette, and other so-called rationalistic teachers in the universities. He died at Berlin, May 28, 1869.

His chief works were *Beitrage zur Einleitung ins Alte Testament* (1831–39; Eng. trans. 1847 and 1848); *Christologie des Alten Testaments* (2d ed. 1854–57; Eng. trans. 4 vols. 1854–59); *Geschichte des Reiches Gottes unter dem Alten Bunde* (1869–70; Eng. trans. 1871–72); *Die Weissagungen des Propheten Ezechiel* (1867–68; Eng. trans. 1869); *Die Juden und die Christl. Kirche* (1857); and *Die Bücher Mosis und Aegypten* (1841; Eng. trans. 1845). His commentaries on the Psalms (1842–45; Eng. trans. 1845–48), the Apocalypse (1850–51; trans. 1852), and the Gospel of St John (1861–62; trans. 1865). See his Life by Bachmann and Schmalenbach (1876–92).

Henley, John, commonly known as Orator Henley, the son of the vicar of Melton Mowbray, in Leicestershire, where he was born on 3d August 1692, set up in London in 1726 what he called an 'oratory,' whence he professed to teach universal knowledge in week-day lectures and primitive Christianity in Sunday sermons. He dubbed himself the 'restorer of ancient eloquence,' and practised in the pulpit the arts of the theatrical attitudinarian. He sold medals of admission to his lectures and sermons, bearing the device of a rising sun, with the motto *Ad summa* and the inscription *Incessum erat et facies*. Yet he was not without genius as an orator, and by this and his eccentricities attracted during several years large crowds to hear him preach and teach. And he doubtless drew many by his queer advertisements, sometimes quaint, sometimes sarcastic, but always designed to catch the curious and the idle. His addresses were a strange mixture of solemnity and buffoonery, of learning and ribaldry, of good sense and personalities, of wit and absurdity. Pope spits him on his literary lance in the *Dunciad:*

> Endless was all [illegible] Henley stands,
> Tuning his voice and balancing his hands.
> How fluent nonsense trickles from his tongue!
> How sweet the periods, neither said nor sung!
> Oh great restorer of the good old stage,
> Preacher at once and zany of thy age!

Nevertheless he was not altogether ridiculous; he was a man of considerable knowledge, and had even some learning in oriental matters. Whilst still an undergraduate at Cambridge he sent a witty letter to the *Spectator* (1712), and in 1714 published a poem, *Esther*, which contains several passages indicative of imagination, and couched in elegant verse. After he left Cambridge he taught in the school of his native town, and there his bubbling energy introduced several reforms and innovations. At this time he compiled a grammar of ten languages, *The Complete Linguist* (1719–21). He went to London, where he earned his livelihood by writing; he was also a pensioner of Walpole, and edited a weekly paper. He died 13th October 1756. His *Oratory Transactions* contain a Life of himself.

Henley, William Ernest, LL.D., poet, playwright, critic, and editor, was born at Gloucester, 23d August 1849. Months of sickness in Edinburgh Infirmary (1873–75) bore fruit in *A Book of Verses* (1888), which won much attention, and was followed by *Views and Reviews* (1890), *The Song of the Sword* (1892), &c. Mr Henley has also been editor of the *Magazine of Art*, the *Scots* (or *National*) *Observer*, and the *New Review*, besides editing Burns and Byron. He collaborated with R. L. Stevenson in three plays, *Deacon Brodie*, *Beau Austin*, and *Admiral Guinea* (reprinted 1892).

Henley-on-Thames, a municipal borough of Oxfordshire, at the base of the Chiltern Hills, and on the left bank of the Thames, 8 miles NE. of Reading, 36 W. of London, and 24 SE. of Oxford by road (by river 47). The five-arch bridge was built in 1786 at a cost of £10,000; the parish church, Decorated in style, was restored in 1864; and the grammar-school was founded in 1605. Malting is a principal branch of industry; there are also breweries, and a considerable trade in corn, flour, and timber. The principal amateur regatta of England has been held here every summer since 1839. Pop. (1851) 2595; (1881) 4604; (1891) 4913. See Rowing; also J. S. Burn, *A History of Henley-on-Thames* (1861).

Henna, a small shrub, called by botanists *Lawsonia alba* (also *L. inermis* or *spinosa*, the younger bushes being spineless). It is also known as 'Egyptian privet' or 'Jamaica mignonette.' Henna grows in moist situations through

out the north of Africa, Arabia, Persia, and the East Indies. It is cultivated in many places for the sake of its flowers, which are much prized for their fragrance, particularly by the Egyptian ladies; but still more for the sake of the leaves, which abound in colouring matter, and which, being dried, powdered, and made into a paste with hot water and catechu, are very generally employed by women throughout the East to stain the nails and tips of the fingers and parts of their feet of an orange colour; also by men to dye their beards, the orange colour being converted into a deep black by indigo; and for dyeing of the manes and hoofs of horses, and to dye skins and leather reddish-yellow. Powdered henna leaves form a large article of export from Egypt to Persia, and to various parts of Turkey, from which they find their way to more northern countries, and even to Germany, to be employed in dyeing furs and some kinds of leather. The use of henna for staining the nails appears—from allusions in ancient poets, and from some of the Egyptian mummies—to have prevailed from very ancient times. It is perhaps the camphire of the Bible. The use of henna for hands and feet is said to check perspiration, and gives a feeling of coolness. The process has to be repeated every two or three weeks.

Hennegau. See HAINAULT.

Henningsen, CHARLES FREDERICK, an English soldier of fortune and author, was born in 1815, served with the Carlists in Spain, where he rose to the command of the cavalry, with the Russians in Circassia, with Kossuth in Hungary, and with Walker in Nicaragua. In the American civil war he commanded a brigade on the Confederate side; and he afterwards was employed to superintend the manufacture of Minié rifles. He died at Washington, 14th June 1877. His books are for the most part records of travel and personal adventure, but include also *The Past and Future of Hungary* (1852), and *The White Slave*, a novel.

Henotikon (Gr. *henōtikos*, 'serving to unite'), an edict for uniting the Eutychians with the church, issued by the Emperor Zeno in 482 A.D.

Henrietta Maria, born at the Louvre, 25th November 1609, was the youngest child of Henry IV. of France, whose assassination six months afterwards left the babe to the unwise upbringing of her mother, Marie de Medicis. A lovely little thing, bright of eye and wit, but spoilt and wayward, she was married in 1625 to Charles I., and speedily evinced her bigotry, if not by a barefoot pilgrimage to Tyburn, yet by refusing to share in her husband's coronation. The dismissal, however, of her French attendants, and the murder of Buckingham, removed two conflicting causes of jealousy; and for ten years Henrietta might call herself 'the happiest woman in the world—happy as wife, mother, and queen.' But she had also made herself the best-hated woman in England. Strafford fallen (she did her worst to save him), and herself menaced with impeachment, on 23d February 1642, the eve of the Great Rebellion, she parted from Charles at Dover, and, repairing to Holland, there raised £2,000,000. A year later, after a great storm, during which she bade her ladies 'Take comfort: queens of England are never drowned,' she landed at Bridlington (q.v.), and, marching through England, again met King Charles near Edgehill. She sojourned with him at Oxford, until on 3d April 1644 they separated at Abingdon, never to meet on earth. At Exeter, on 16th June, she gave birth to a daughter, and in less than a fortnight had to flee before Essex to Pendennis Castle, whence she took shipping for France. A cruiser gave chase, and she charged the captain to blow up the magazine sooner than let her be captured; but at length she landed on the coast of Brittany. A liberal allowance was assigned her, but she pinched herself to send remittances to England; and the war of the Fronde (1648) had reduced her for a time to destitution, when, nine days after the event, news reached her of her husband's execution. That even this crowning sorrow failed to teach wisdom is shown by her quarrels with her wisest counsellors, and her efforts to convert her children. The story, however, of her secret marriage to her confidant, Henry Lord Jermyn (afterwards Earl of St Albans), rests solely on gossip. After the Restoration, 'la Reine Malheureuse,' as she called herself, paid two visits to England—one of four months in 1660–61, the other of three years in 1662–65. Pepys describes her as 'a very little, plain old woman.' She died of an overdose of an opiate on 31st August 1669, at her château of Colombes, near Paris, and was buried (Bossuet preaching the funeral sermon) in the abbey of St Denis, whence her coffin was ousted at the Revolution.

See CHARLES I. and works there cited; also Strickland's *Queens of England* (new ed. vol. v. 1851).

HENRIETTA, DUCHESS OF ORLEANS, Charles I.'s youngest child, was born 16th June 1644. Her mother, Henrietta Maria, had to leave her behind at Exeter, which in April 1646 was taken by Fairfax; but three months afterwards, disguised as a French beggar-woman, her governess, Lady Dalkeith, escaped with her from Oatlands to Calais. Her mother brought her up a Catholic. Gay, brilliant, beautiful, in 1661 she was married to Louis XIV.'s only brother, Philip, Duke of Orleans; 'of all the love he had borne her there soon remained nothing but jealousy.' As Louis's ambassadress, in 1670 she wheedled Charles II. into signing the secret treaty of Dover; and she had been back in France little more than a fortnight, when on 30th June she died at St Cloud—almost certainly of poison, but possibly without her husband's cognisance.

See CHARLES II. and works there cited; Mdme. de la Fayette's *Histoire d'Henriette d'Angleterre* (1720; new ed. by An. France, 1882); Mrs Everett Green's *Princesses of England*; and monographs by Baillon (French, 1855) and Julia Cartwright (Mrs Ady; 1893).

Henry I., king of England, the youngest and only English-born son of William the Conqueror, was born in 1068, according to tradition at Selby, in Yorkshire. His father left him £5000, with a part of which he bought the districts of the Cotentin and the Avranchin from his brother, Robert of Normandy; and, when war broke out between William Rufus and Robert, Henry, although he had been imprisoned by the latter, helped him to defend Normandy, and saved his capital city, Rouen, for him. Yet in the treaty which followed (1091) he was excluded from the succession, and his brothers joined to deprive him of his lands. Immediately after the death of William he rode to Winchester, seized the royal treasure, and in the absence of Robert, who was then on his way home from crusading in Palestine, was elected king by such of the Witan as were at hand, and crowned at Westminster four days after. He at once issued a charter restoring the laws of Edward and the Conqueror, recalled Anselm, and set about the stern reforms which gained him among his people the name of the Lion of Justice. He also strengthened his position by a marriage with Eadgyth (her name was changed to Matilda), daughter of Malcolm of Scotland and the good Queen Margaret, who was descended from the old English royal house. The highest honours under Henry, both in church and state, were

strictly withheld from men of English blood; yet it was on the native English support that the king relied; and in 1101, when the nobles conspired to bring in Robert, who had now returned home, the English stuck faithfully by the king born in their own land, and the Normans were powerless. Without a battle Robert was induced to resign his claims, and Henry then established his power so securely that there was peace in England to the end of his reign. On the Scottish border also there was peace, and only twice (1114 and 1121) did Henry feel compelled to make expeditions into Wales. His controversy with Anselm (q.v.) regarding investiture, too, was conducted without bitterness on either side, and resulted in a compromise; while a later dispute with the papal see was ended in 1119 by Calixtus solemnly confirming the ancient customs of England.

Robert had received a pension of 3000 marks, but in 1105-6 Henry made war upon his badly governed duchy; Robert was defeated in a bloody battle beneath the walls of Tinchebrai, on September 28, 1106, and was kept a prisoner during the remaining twenty-eight years of his life. The acquisition of Normandy, the ancient patrimony of his family, had been a point of ambition with Henry; to hold it he was obliged to spend long periods away from his kingdom, and to wage a nearly constant warfare, supported largely by English arms and by subsidies wrung from his English subjects. The French king, Louis the Fat, and the Counts of Anjou and Flanders took part with William, Robert's youthful son; but the first war ended in the peace of Gisors (1113), on terms favourable to Henry; and in the following year his daughter Matilda was married to the Emperor Henry V. of Germany, and a new alliance thus formed. The second war (1116-20) was marked by the defeat of the French king at Noyon in 1119; and in the same year he presented a formal complaint to Calixtus II. at the Council of Rheims. Henry, however, was able in a personal interview to satisfy the pope, who succeeded in bringing about a peace. In 1119, also, Henry's only son, William, was married to the daughter of the Count of Anjou; but in 1120 he was drowned by the sinking of the White Ship on his way from Normandy to England, and Henry's successes in arms and intrigue were darkened for life. A fresh rebellion in Normandy ended in the battle of Bourgtheroulde (1124), and in cruel punishments inflicted on the principal prisoners taken. In 1126 Matilda, now a widow, came back from Germany; in the same year Henry induced the Witan to swear to receive her as Lady of England and Normandy if he should die without heirs-male; and before the year was out she was married to Geoffrey Plantagenet, the son of the Count of Anjou. In 1127 Robert's son William was put in possession of the vacant countship of Flanders; but in 1128 he died, and the wars between Henry and Louis ceased. Henry himself died on December 1, 1135, and the crown was seized by his sister Adela's son, Stephen of Blois.

Henry I. was styled Beauclerc, or the Scholar, in honour of his learning, which, for a king in his age, was not undeserving of distinction. Able he was, but crafty, passionless in his policy, and often guilty of acts of cold-blooded cruelty; yet he was at least consistent in his severity, unmoved by impulses such as, generally evil but sometimes good, had governed Rufus; and even his licentiousness was judged lightly after the foul vices of the Red King. Law was administered during his reign with strictness, and generally with fairness; the innocent might now and then be confounded with the guilty, and the penalties were often severe and barbarous enough, but, at the worst, only individuals suffered from his cruelty, while the great mass of his subjects reaped the blessings of his firm rule. Moreover, under the equal weight of his heavy hand, Normans and English were slowly compressed into one nation; and after the landing of Robert at Portsmouth in 1101, never again did the two races meet in arms face to face on English soil. 'Good man he was,' writes the chronicler, 'and mickle awe was of him. Durst none man misdo with other on his time. Peace he made for man and deer.'

See Freeman's *Norman Conquest*, vol. v. (1876); also Stubbs, *Constitutional History of England*, vol. i. (1874); and Dean Church's *Saint Anselm* (1870).

Henry II. of England, the first of the Angevin kings, was the son of Matilda, daughter of Henry I., and her second husband, Geoffrey Plantagenet, and was born at Le Mans, March 5, 1133. His mother, assisted by her illegitimate brother the Earl of Gloucester, had carried on a bitter war against Stephen, as a usurper, from 1139 to 1148. Henry himself, unable after his uncle's death to secure any powerful following, joined his father in Normandy. At eighteen he was invested with this duchy, his mother's heritage, and within a year after became also, by his father's death, Count of Anjou; while in 1152 his marriage with Eleanor of Aquitaine, the divorced wife of Louis VII., added Poitou and Guienne to his dominions, which now embraced nearly the whole of western France. In January 1153 he landed in England; and, after his and Stephen's armies had twice been face to face, a treaty was finally agreed to in November, whereby Henry was declared the successor of Stephen, whose son Eustace had died during the negotiations. Stephen died the next year; Henry was crowned on 19th December 1154, and issued a charter confirming his grandfather's laws. He at once re-established the machinery of the exchequer, banished the foreign mercenaries, demolished the hundreds of castles erected in Stephen's reign, and recovered the royal estates. The whole of the year 1156 the king spent in France, where he was employed until July in effecting the submission of his brother, Geoffrey of Nantes. Geoffrey died in 1158, and Henry, having secured his territories, spent five years warring and organising his possessions on the Continent, whence he returned in January 1163 to enter on the disastrous quarrel with the church that fills the second period of his reign.

Henry, like his grandfather, had come to the crown after an evil time of misgovernment and of anarchy, and his fame too is that of a lawgiver, the restorer of peace and order. His object was that of all the Norman kings—to build up the royal power at the expense of the feudal barons and of the church; but his policy, while selfish in its aim, was beneficent in result, inasmuch as he was wise enough to recognise that his power could be securely founded only on the well-being of the people. From the barons themselves his reforms met at the time with little serious opposition; with the clergy he was less successful. Not only could they use their weapon of excommunication with terrible effect, but, being tried by their own courts, they were not amenable to the common laws of the realm, and were protected from the punishment due to their crimes; so that thieves and murderers, calling themselves clerks, would for a first offence escape with penances and deprivation of orders. To aid him in reducing the church to subjection to the civil power he appointed his trusted chancellor, Becket, to the see of Canterbury. This was the great mistake of his life, for with his archbishop's pall Becket put on the spirit of the high ecclesiastic, and abandoned the king's service for the pope's. Henry compelled

him and the other prelates to agree to the 'Constitutions of Clarendon' (q.v.); but Becket proved a sturdy churchman, and the long and obstinate struggle between him and his monarch was only terminated by his murder (see BECKET). Henry was barely saved from excommunication by his messengers making for him an unreserved submission to the pope; but he was determined not to repeat their oath. At a later date (1174) he did penance at Becket's grave, allowing himself to be scourged by monks; but, though the 'Constitutions of Clarendon' were formally repealed, the king was ultimately successful in reducing the church to subordination in civil matters. Before Becket's death Henry had made three military expeditions into Wales, none of them, however, of any permanent effect; and, while negotiations were pending for his absolution, he organised an expedition to Ireland. The English pope, Adrian IV., had in 1155, by the famous bull *Laudabiliter*, given Henry authority over the entire island; and in 1167 a number of Norman-Welsh knights, having been called in to the aid of a banished king of Leinster, had gained a footing in the country. Others soon followed, among them, in 1170, Richard de Clare, afterwards nicknamed Strongbow, who married the heiress of Leinster, and in 1171 assumed rule as the Earl of Leinster. Henry was jealous of the rise of a powerful feudal baronage in Ireland, and during his stay there, from the autumn of 1171 to Easter 1172, while waiting for the arrival of the friendly legates from Rome, he secured the submission of kings and bishops, and left the power of Strongbow and the other nobles broken. For thirteen years his governors carried out his system of interference and persecution; and when in 1185 Prince John was appointed king of Ireland, he took with him a batch of Norman and French knights who pushed the soldiers of the first conquest aside. But before the end of 1186 John himself was driven from the country, and all was left in confusion.

The third period of Henry's reign is occupied with the rebellion of his sons. The eldest had died in childhood; the second, Henry, born in 1155, was crowned as his father's associate and successor in the kingdom in 1170, having been married at the age of five to the little princess Margaret of France. In 1173, incited by their jealous mother, Queen Eleanor, the prince and his brother Richard rebelled against their father, and their cause was espoused by the kings of France and Scotland. The latter, William the Lion, was ravaging the north of England with an army, when he was surprised at Alnwick, and taken prisoner, 12th July 1174. To obtain his liberty, he submitted to do homage to Henry for Scotland (see SCOTLAND; also EDWARD I.). By September 1174 Henry had defeated the great league thus formed against him, and re-established his authority in all his dominions. In the course of a second rebellion, Prince Henry died of a fever at the age of twenty-eight; and in 1185 Geoffrey, the next son, was killed in a tournament at Paris. At the end of 1188, while Henry was engaged in a war with Philip of France, Richard joined the French king; and in July, Henry, having lost the chief castles of Maine and the town of Le Mans, ill and broken in spirit, agreed to a treaty of peace, of which one of the stipulations was for an indemnity for all the followers of Richard. The sight of the name of his favourite son John in the list broke his heart; and he died at Chinon on 6th July 1189.

Upon the whole, Henry was an able and enlightened sovereign, a clear-headed, unprincipled politician, an able general. He did not use his power despotically; and such enemies as he could either win over or disable he spared. His reign was one of great legal reforms. With the exchequer the ancient office of the sheriffs was restored, the jury system was extended, circuit courts were established, and a high court of justice formed; whilst the institution of Scutage (q.v.) and the revival of the old Anglo-Saxon militia system did much to break the power of the great feudal lords. The earliest writer on English law, Ranulf de Glanvill (q.v.), was Henry's chief justiciary from 1180. He was ambitious for his children, but he used them so freely as counters in the great game of politics that he ultimately alienated whatever affection they had to give; yet, even so, he was sinned against deeply by both his wife and his sons. When not restrained by policy his temper was passionate and outrageous; and his personal vices were those of the first Henry. Fair Rosamond (see CLIFFORD) is commonly said to have had two sons by him, William Longsword, Earl of Salisbury, and Geoffrey, who became Archbishop of York, and who was faithful to him when his four legitimate sons took up arms against him. But there is no positive evidence that the former was her son; while Geoffrey's mother appears to have been a woman of degraded character, named Ykenai or Hikenai.

See Freeman; Stubbs, *Constitutional History*, and preface to vol. ii. of the *Chronicle of Benedict of Peterborough* (1867); and Mrs Green, *Henry the Second*, in 'Twelve English Statesmen' series (1888).

Henry III. of England, grandson of Henry II., and eldest son of King John, was born 1st October 1207, and succeeded to the throne on his father's death at the age of nine. His reign is one of the longest and most troubled in English history, and he himself one of its least attractive and least interesting figures. The first forty-two years are for the most part a dreary record of misgovernment and purposeless extravagance, the next seven a period of strife and civil war, the remainder of little interest. Henry was more devout than his predecessors, and could boast more domestic virtues; but he inherited his father's faithlessness, and through all his impolicy exhibited a stubborn determination to be at least as autocratic as he. The interest of the reign, however, centres not in the king, but in the birth and infancy of the English constitution. In 1227 Henry declared himself of age to govern; in 1232 he deprived Hubert de Burgh, who had ruled England well as regent, and as justiciary had practically continued to govern the country, of all his offices; and in 1234 he was compelled to dismiss Hubert's rival and successor, Peter des Roches. He took the administration into his own hands, and henceforward managed everything ill both at home and abroad. A war with France cost him Poitou, and might have cost him all his continental possessions, and even his own liberty, but for the generous disposition of the French king, Louis IX. In his boyhood, under the direction of the judicious Earl of Pembroke, he re-issued the Great Charter, though with certain important omissions; and he confirmed it more than once afterwards, but always as a condition of a money grant. He was beset with favourites, chiefly from the country of his queen, Eleanor of Provence, and he allowed exorbitant exactions on the part of the pope. His misrule and extortion roused all classes, and in 1258 the parliament, as the assembly of the barons and bishops was already called, headed by his brother-in-law, Simon de Montfort, Earl of Leicester, forced him to agree to the Provisions of Oxford (q.v.), whereby he transferred his power temporarily to a commission of barons. But jealousy and disunion among the barons soon enabled Henry to repudiate his oath, and after a brief period of open war (1263) the whole matter was referred to

the arbitration of Louis of France, who annulled the Provisions. De Montfort and his party disregarded their agreement to be bound by his judgment, and took up arms against the king. They defeated him, and took him prisoner in the battle of Lewes, on 14th May 1264. The battle was followed by an agreement called the Mise of Lewes (q.v.), more humiliating to the king than the Provisions of Oxford. Earl Simon now summoned the parliament (20th January 1265) which has since been famous as the first assembly of the sort in which boroughs were represented; although it was nearly the end of the century before the representatives of towns began regularly to sit in parliament. De Montfort's supremacy did not last long. Within a year the powerful Earl of Gloucester deserted his party, and, with Prince Edward, who had escaped from captivity, led an overwhelming army against him. Simon was defeated and slain at Evesham, on 4th August 1265. With this event the importance of this long, dismal reign ends. Henry died on 16th November 1272, and his son Edward, though absent in Palestine, was at once proclaimed king.

See Freeman, Stubbs (vol. ii.), Prothero's *Life and Times of Simon de Montfort* (1887), and other works cited at MONTFORT.

Henry IV. of England, the first king of the House of Lancaster, was born 3d April 1367, the son of John of Gaunt, and was surnamed Bolingbroke, from his birthplace in Lincolnshire. His father was the fourth son of Edward III., his mother the daughter of Duke Henry of Lancaster. In 1386 Henry was made Earl of Derby, and married Mary de Bohun, the second richest heiress in England. For some years he led a roving life. He was present at the taking of Tunis in 1390, fought against the heathen on the shores of the Baltic, made an attempt to reach Jerusalem in 1392–93, and commanded some English lances in the disastrous battle against the Turks at Nicopolis (1396). In 1397 he supported Richard II. in the revolution which destroyed the Duke of Gloucester, and was created Duke of Hereford; in 1398 he was banished, and in the following year, when his father died, his estates were declared forfeit to Richard. Thereupon, in July 1399, Henry landed in Yorkshire with three small vessels. He met with no opposition; and on September 29, in the Tower, he induced Richard, who had been deserted and betrayed, to sign a renunciation of his claims to be king. On the next day Henry rose in his place in parliament and claimed the kingdom and crown, all present assenting. The act was a usurpation, for Henry's claim to succeed by right of birth was barred by the six-year-old son of the Earl of March, who was descended from an older branch. Richard was shut up in the castle of Pomfret. There was an attempted rising on the part of his friends in the following January, but it was easily suppressed, the leaders being beheaded by the mob; and in the middle of January 1400 Richard died in his dungeon, probably from starvation. Yet his death was more than once denied by the disaffected party, and many cruel executions were necessary before the report that he had escaped to Scotland could be silenced. Henry's reign was one of trouble and commotion. There were incessant rebellions, and more than one treacherous attempt was made upon his life, until in his last years he was reduced to a state of constant fear. Lawlessness, rising partly out of the great poverty and heavy taxation, was rife in every quarter; piracy crippled commerce, though not much more so than the increased duties laid on staples; and frequent descents were made upon the coast by expeditions from France—for the country of Richard's young queen was Henry's implacable enemy. The king's movements, too, were constantly hampered for want of money, there being no funds available for anything beyond the most ordinary expenses of the country; and 'war treasurers' were ultimately appointed by the impatient Commons to watch the disbursement of the sums voted. In 1404 the Illiterate Parliament, to which it had been directed that no lawyer should be returned as a knight of the shire, proposed to confiscate the property of the clergy; but the necessity under which Henry found himself of supporting the authority of the church led him not only to discountenance all such proposals, but also to permit severe enactments against heretics. On 2d March 1401 the first case in England of burning for heresy occurred, when a clergyman named William Chatrys was burned at Smithfield.

The chief disturbances of the peace of the reign, however, were occasioned by the Welsh and the Scots. Under Owen Glendower (q.v.) the Welsh maintained their independence throughout this reign, and kept up a harassing warfare against the English. Scotland Henry invaded in 1400, besieging Edinburgh Castle until compelled by famine to retire. In 1402, while Henry was engaged against the Welsh, the Scots in turn made an irruption into Northumberland with 40,000 men; but a body of some 10,000 of them were encountered by the Earl of Northumberland and his son Harry Percy, with a force computed at 12,000 lances and 7000 archers, and met with a crushing defeat (14th September) at Humbleton (or Homildon), where Earl Douglas and the Duke of Albany's son were taken prisoners. Harry Percy (Hotspur) and his house shortly after broke with the king, and leagued with Douglas and Glendower against him; but the king met the Percies at Shrewsbury (21st July 1403), where the insurgents were utterly defeated, Hotspur slain, and Douglas again taken prisoner. Two other insurrections followed, but were easily suppressed; and the remainder of the reign was comparatively free from domestic troubles. In 1406 Prince James of Scotland (afterwards James I.) was captured on his way to France, and was detained and educated in England. The civil wars in France gave Henry an opportunity to send two expeditions (1411 and 1412) to that country; but in his later years he was a miserable invalid, afflicted with epileptic fits, the last of which seized him while in Westminster Abbey. He died on 20th March 1413, in the Jerusalem Chamber; and this was taken to explain a prophecy which had said that he was to die at Jerusalem—and as late as the preceding November he certainly had hoped to go once more on crusade. Henry's last days were embittered by a dread that he would be supplanted by his eldest son. He had commenced his reign energetic and determined to govern on constitutional principles; to this resolve he remained steadfast, as he maintained also his devoutness and purity of life; but disappointment and perhaps disease latterly made him cruel, vindictive, suspicious, and irresolute. The labour and sorrow of founding a dynasty were his, and his usurped crown he found a heavy burden.

See Stubbs, vol. iii.; Gairdner, *The Houses of Lancaster and York*, in 'Epochs of History' series (1874); and especially Wylie, *History of England under Henry the Fourth* (1884–98). To these must be added, for this and the next two reigns, and for Henry VIII., Shakespeare's historical plays, which are based mainly on the Chronicles of Hall and Holinshed (q.v.). For their value as history, see Courtenay's *Commentaries on the Historical Plays of Shakespeare* (2 vols. 1840).

Henry V. was born in the castle of Monmouth, 9th August 1387, the eldest of the six children of Henry IV. by Mary de Bohun, from whom he

inherited a certain taste for books. According to a local tradition, he studied for a time at Queen's College, Oxford, perhaps in 1399–1400. From 1401 we find him engaged against Glendower, and in 1403—the year of Shrewsbury, where he was wounded in the forehead by an arrow—he was appointed the king's lieutenant in Wales. Here he remained in command of operations until 1408, and succeeded at least in keeping Glendower behind the barriers of his mountains. In 1409 he became constable of Dover, and in 1410 captain of the town of Calais; and in one of these places, or in London, he resided until his father's death. The story of his committal to prison is a fiction (see GASCOIGNE), and may be traced to a passage in the life of Edward II. when Prince of Wales. There is some evidence that Henry was for a time not on good terms with his father; but the charges of riot and profligacy are at least gross exaggerations of a young soldier's harmless, boisterous frolics. He was crowned on 10th April 1413, and at the outset of his reign liberated the young Earl of March, who was the true heir to the crown, restored the son of Hotspur to the lands and honours which his father had lost by rebellion, and had Richard II.'s body brought up from Langley and buried in Westminster. The great effort of his reign was an attempted conquest of France, now ruled by an imbecile king and distracted by internal factions; and in 1414 Henry formally demanded the French crown, to which he seems to have believed sincerely that he had a valid claim, through his great-grandfather, Edward III. On 11th August 1415 he sailed with an army of 30,000 men, after crushing a conspiracy to carry off the Earl of March; and on 22d September he took Harfleur, after five weeks' siege, at a great cost of life, including 2000 men carried off by dysentery. On 8th October he set out on a march to Calais, and at Agincourt (q.v.), on the 25th, where his way was blocked by a French army, gained a battle against such enormous odds as to make his victory one of the most notable in history. Two years after he again invaded France, and by the end of 1418 Normandy was once more subject to the English crown. Henry's forces had appeared before the walls of Paris, when the murder of the Duke of Burgundy (10th September 1419) aroused the indignation of France against the dauphin, who had to withdraw beyond the Loire; and on 21st May 1420 was concluded the 'perpetual peace' of Troyes, under which Henry was recognised as regent and 'heir of France,' and received the French king's youngest daughter, Catharine, in marriage. In February 1421 he took his young queen to England to be crowned, having shown the same promise of just and vigorous rule as he had already done in Normandy; but in a month he was recalled by news of the defeat at Beaujé of his brother the Duke of Clarence, by a force consisting largely of Scotch, commanded by the Earl of Buchan. Henry returned to France for a third campaign, and his wonted success in arms was attending him, when he was seized with illness, and died at Vincennes on the 31st August 1422, at the age of thirty-five, leaving an infant to succeed him. Henry was a deeply devout prince, temperate, just, and pure of life; yet his religion, though he was free from wanton cruelty, did not make him merciful to a conquered enemy. He followed his father, too, though apparently with reluctance, in his treatment of the Lollards; even his old companion-in-arms, Sir John Oldcastle (q.v.), was sent to the stake. He was a brave soldier, a firm disciplinarian, a brilliant general; and he died when his fame was brightest.

See Stubbs; Gairdner, *Lancaster and York*; Nicolas, *History of the Battle of Agincourt* (1827); and A. J. Church, *Henry the Fifth* (1889), in the 'English Men of Action' series.

Henry VI., the only child of Henry V. and Catharine of France, was born at Windsor on 6th December 1421. As he was not quite nine months old when his father died, his uncle, John, Duke of Bedford, was appointed to govern France, and another uncle, Humphrey, Duke of Gloucester, to be protector of England in Bedford's absence, with a council appointed by parliament to aid and control him, the parliament declining to appoint him regent, though the late king had desired it. After twenty-four years' captivity, the Scotch king, James I., was set at liberty in the hope of securing peace on the northern border. In France, the incapable Charles VI. having died, his son the dauphin assumed the title of Charles VII., and went on fighting with the English. His army, commanded by the Scottish Earl of Buchan, now constable of France, was almost annihilated by the English at Verneuil (1424). But this victory was the last great success obtained by the English in France, and their power, which could only be maintained by force, gradually crumbled away. Gloucester's marriage with Jacqueline of Hainault (1423) during the life of her husband, John of Brabant, had strained the alliance with Burgundy, which soon after lost its strongest link by the death of Bedford's wife, Duke Philip's sister, in 1432. In 1429 the siege of Orleans was raised by the French, inspired by Joan of Arc (q.v.); and after this the English power declined steadily, in spite of their having burned Joan as a witch in 1431. Henry was crowned king of England at Westminster in 1429, and king of France at Paris in 1431; but the struggle, though continued for twenty years, was seen to be desperate. Bedford, the only great and statesmanlike leader on the English side, died in 1435; Paris was recovered by the dauphin in the following year; Normandy was completely lost by the fall of Cherbourg in 1450; and ultimately, in 1453, the English were expelled from all France (Calais excepted), greatly to the true advantage of both countries.

Disputes between Gloucester and his uncle, Cardinal Beaufort (q.v.), the powerful Bishop of Winchester, as well as war with France, prevailed during the king's minority. Besides being bodily weak, Henry inherited the mental infirmity of his grandfather, Charles VI. of France. In 1445 a wife was found for him in the strong-minded Margaret of Anjou; and in 1447 the Winchester party, supported by her, succeeded in having Gloucester arrested for high-treason. Five days later he was found dead in his bed; but that he was murdered there is no proof, and such evidence as we have tends to the opposite belief. Beaufort, who had served the state faithfully for fifty years, survived his nephew only six weeks, and after his death everything went wrong. The want of strength in the king, as well as in his title to the crown, was an invitation to every form of faction to display itself. Jack Cade (q.v.), an Irish adventurer who pretended to be a Mortimer, obtained a temporary possession of London; but the citizens overcame him and his pillaging followers, and he was killed in Sussex. The true representative of the Mortimers was Richard, Duke of York, and he was one of the unquiet spirits of the reign. As a descendant of Lionel, Duke of Clarence, the third son of Edward III., his title to the crown was superior to that of the king, who was descended from the Duke of Lancaster, the fourth son of that monarch, and he laid claim to the crown with more or less openness, according to circumstances. His influence and address were so great that in 1454, on the occasion of

the king's weak mind being entirely eclipsed, he was appointed protector by parliament. On the king's recovery he was indisposed to give up his power, and levied an army to maintain it. On 22d May 1455 the first battle of St Albans was fought, and the Yorkists were victors; the Duke of Somerset, the queen's favourite minister for the time, was slain, and the king himself was taken prisoner. This was the first battle of twelve that were fought between the Houses of York and Lancaster in the Wars of the Roses (for an account of the struggle, see Roses, Wars of the; see also Edward IV.). A return of Henry's disorder made York again protector in 1455–56; and on his recovery the poor king vainly strove to maintain peace between the duke's faction and the queen's. Margaret headed the Lancastrian forces, and never relinquished the struggle; but in 1461 Edward IV. was proclaimed king, and in 1465 Henry was captured and committed to the Tower. In 1470 Warwick restored him to the throne, but six months after he was again in Edward's hands; and at Tewkesbury (4th May 1471) his son was slain and Margaret taken prisoner. Edward returned to London on the 21st May; and that night Henry was murdered in the Tower. Margaret was ransomed by Louis XI. in 1475, and returned to France. Henry had lost both the kingdoms to which he had succeeded, and seen all his friends die vainly for his sake. The most unfortunate of kings, his reign stands out in English history as one long disaster. He himself was a just and merciful prince, pious, pure, and generous; but the gentle and saintly scholar, with his fits of imbecility, was no fit monarch for times so rough. His highest claim on our gratitude is that he founded Eton College and King's College, Cambridge.

See Stubbs; Gairdner's *Lancaster and York*, and his introduction to the *Paston Letters* (vol. i. 1872).

Henry VII., founder of the Tudor dynasty, was born at Pembroke Castle, the seat of his uncle, the Earl of Pembroke, on January 28, 1457. His father, Edmund Tudor, was the son of Owen Tudor, a knight of Wales, and of his wife, Queen Catharine, the widow of Henry V.; he had been created Earl of Richmond by his half-brother, Henry VI., and died before his son's birth. His mother, Margaret Beaufort, was the lineal representative of the House of Lancaster, being descended from John of Gaunt and Catharine Swinford, whose children were legitimated after their marriage. The young Earl of Richmond was thus the nearest heir, after Richard III. had murdered his nephews, the sons of Edward IV., except their sisters and Richard himself. After Tewkesbury he found asylum in Brittany, until he was invited to invade England and rescue it from the usurper. The first attempt (1483) ended in failure, and cost the Duke of Buckingham his head; but in August 1485 Richmond landed at Milford Haven, and marched across the country to Bosworth, in Leicestershire, where Richard was defeated and slain. Henry now ascended the throne; and his marriage with Elizabeth of York, Edward IV.'s eldest daughter, by which the White Rose and the Red were united, was celebrated in the following January. His reign was troubled by several impostors claiming the crown: first, Lambert Simnel, an Oxford joiner's son, who professed to be the Earl of Warwick, Clarence's son, and was proclaimed king in Ireland, but was defeated at Stoke in 1487, taken prisoner, and turned into a menial in the king's kitchen; next, Perkin Warbeck, who pretended to be the boy Duke of York, who had *not* been murdered in the Tower by Richard III., and was patronised by the Duchess of Burgundy and supported by the Emperor Maximilian and James IV. of Scotland, but was finally captured in 1497; and finally, Ralph Wilford, who also pretended to be the Earl of Warwick, but did not succeed in carrying his enterprise far, being almost at once taken and hanged in 1499. In this year Henry, to end his troubles from pretenders, had Warbeck, whom he had pardoned, and the true Earl of Warwick, a youth who had known only captivity all his days, convicted of a plot to recover their liberty, and executed. The execution of the latter is the chief blot on Henry's memory; for the execution of Sir William Stanley, deeply though the king had been indebted to him, there appears to have been ample justification.

In 1492 Henry invaded France, but was bought off with a promise of 745,000 crowns; and this was the only foreign war in which he engaged, although his successful diplomacy gave him an influence in continental politics greater than had been attained by any king of England before him. Ferdinand and Isabella's daughter, Catharine of Aragon, was married to his son Arthur, Prince of Wales, a boy of fifteen, just before he died; and Henry's policy, added to an objection to return part of her dowry, ultimately led him to betroth her to his next son, who became Henry VIII. A marriage from which flowed most important consequences was that of his eldest daughter, Margaret, to James IV. of Scotland, which a century later brought about the union of the crowns. In February 1503 Henry's queen died, and in his active endeavours to obtain a second wife, with a sufficiently large dowry, he proposed a few months later to marry his own daughter-in-law, Catharine, who had been left a widow by Arthur the year before; and in 1506 he even offered to wed her sister Juana, the insane heiress of Castile. With similar projects he was still engaged when he died on April 22, 1509, leaving behind him £1,800,000, worth £18,000,000 in our currency. He was a lover of peace, the friend of the church, the patron of scholarship and architecture, as well as of commerce and adventure. Bacon calls him 'a wonder for wise men,' and 'this English Solomon, for Solomon also was too heavy upon his people in exactions.' But Henry's avarice has been exaggerated. Chiefly he was a financier, yet his legislation was wise and just. He not only ruled, but governed England, and under him the country prospered and the trading-class became more powerful; the taxation was probably not so excessive as has been assumed, and the notorious extortions of the king's lawyers, Dudley and Empson (q.v.), did not touch the great mass of the people. Nor was the king greedy of gold for its own sake; 'to him,' says Gairdner, 'a large reserve was a great guarantee for peace and security.' As a politician Henry was pitted against such cunning opponents as Ferdinand of Spain, and at least matched them all in subtlety and in foresight; and the throne which he had won he left to his son stable and secure.

See Bacon's *History of Henry VII.*; Gairdner's *Henry the Seventh* ('English Statesmen' series, 1889); and Busch's *England under the Tudors* (vol. i. trans. 1895).

Henry VIII., the second of the Tudor monarchs of England, was born in 1491, and ascended the throne in 1509. He was the second son of Henry VII. and Elizabeth of York, and thus united the rival claims of the Houses of York and Lancaster. Previous to the death of his elder brother Henry had been intended for the church; and this early bent of his mind must in some measure explain his life-long interest in all matters of religious faith and church government. During the first years of his reign Henry held a place in the hearts of his people such as no English monarch before or since has ever held. This affectionate admiration, which with strangely little diminution

he retained to the last, was due to the fact that of all English kings he was the most intensely English—mentally, morally, and physically. This enthusiasm of his people was also the natural rebound of feeling after the tame and cautious government of Henry VII., a king, in spite of all his admirable qualities, the last in the world to give rise to any such enthusiasm himself. In his earlier manhood Henry was accounted the handsomest prince of his time, though foreign observers declared that his contemporary, Francis I., bore himself with a more kingly air. In all manly exercises he could hold his own with any of his subjects. His attainments and general mental cultivation were far beyond those of his great rivals, Francis and the Emperor Charles V.; and his accession to the throne was hailed with delight by such men as Colet, Erasmus, and More, as the happiest omen for the new studies which had lately found their way into England.

At the date when Henry ascended the throne of England a ruler was needed with an energy of character and force of intelligence such as had never yet been required of any English prince. With the reign of Henry VIII. begins the modern period of European history. The beginning of the new time was marked by many circumstances that broadly distinguish it from the age that preceded it. In Henry's reign began that relation of the leading powers of Europe to each other which has continued to the present day—a relation of jealous watchfulness, that insists on a 'balance of power' as the necessary condition of the integrity of each separate state. To play his part in the new order, therefore, a range of policy was required of Henry far beyond that of even his most ambitious predecessors. In home affairs, also, questions were thrust upon him which touched the very existence of the nation. By the Wars of the Roses and the policy of Henry VII. the strength of the feudal barons had been broken, and the modern middle class had begun to be a force in the state. Had Henry been a weak ruler, however, there was still sufficient power left in the old aristocracy to have effected at least a temporary reaction, and to have revived the disasters of the late civil wars. Above all the new time was marked by a revolutionary spirit in all questions of religion that strained to the utmost the prudence of Henry and other contemporary princes. In Henry's reign the followers of Luther found their way into all the leading countries of Europe, and by their uncompromising zeal gave the most serious alarm to the upholders of the old order. By the rise of the great rival powers, also, and by his own diminished prestige, the pope and his claims had become a question of the first political importance—a question that affected the entire development of the respective states of Europe. The question of the papal supremacy presented itself to Henry in a special form, but sooner or later it must have presented itself in one form or another, and sooner or later been decided as Henry decided it. It was impossible that the question should not arise whether certain outgrown institutions and privileges should continue in the interest of a foreign potentate, who by the very condition of his existence was now at the bidding of whatever ruler might chance to have the strongest arm. The time, in short, was one when revolutionary forces were everywhere at work; and it is only by keeping this fact before us that we can form any real conception of the most extraordinary reign in English annals.

Shortly after his accession Henry, by the advice of his council, married Catharine of Aragon, his brother Arthur's widow—a step, as it turned out, of tremendous consequence in the destinies of England. The first three years of the reign passed without any memorable event. At home, by a succession of shows and festivities, Henry at once gratified his own taste for pleasure and gained an easy popularity with his people. He also gave further satisfaction by the execution of Dudley and Empson. In 1512 the real history of Henry's reign begins. As a member of the Holy League, formed by the pope (Julius II.) and Ferdinand of Spain against Louis XII., Henry in that year began his first war by the invasion of France. The result was far from encouraging. Overreached by Ferdinand, Henry sent a body of troops to Spain, who disgraced England in the eyes of Europe by mutinying against their leaders, and insisting on being led home without striking an effective blow. The next year Henry invaded France in person, and partly retrieved the national honour at the so-called Battle of Spurs, and by the capture of Terouenne and Tournay. During his absence a greater triumph was gained for England by the disastrous defeat of the Scots at Flodden, which for several years left Henry a freer hand to carry out his continental policy.

It was in this first French war that Henry's great minister, Wolsey, began to take a prominent place in the councils of the nation; and thenceforward till his fall in 1529 the history of this reign is little else than the history of Wolsey. A servant of Henry VII., Wolsey had early ingratiated himself with his son at once by his pliant courtliness and his consummate ability in public affairs. So early as 1514 Wolsey was after the king himself the first man in the country. During the sixteen years of his administration the history of England is the history of its foreign policy. In this policy the chief aim of Wolsey and his master (for Henry even at his most thoughtless period never wholly neglected public business) was to hold in equipoise the two great continental powers, France and Spain, and by maintaining the position of arbiter to win for England an importance to which her own resources hardly entitled her. In pursuance of this aim the support of England was till 1525 given to Spain against France. In this first period of the reign the foreign events on which the most important consequences turned were the election of the emperor in 1519, the battle of Pavia in 1525, and the sack of Rome in 1527.

From the election of Charles of Spain to the empire over Francis I. of France began that rivalry between these two princes which for a quarter of a century distracted western Europe with almost continuous war. It was of the utmost importance both to Charles and Francis what side Henry should take in the duel they saw before them. Both, accordingly, were eager in their proffers of friendship to the English king. At the *Field of the Cloth of Gold*, near Guisnes, in the English dominion in France, where Henry and Francis met in 1520 amid a blaze of grandeur that sorely drained the purses of both nations, a meeting took place, which, after many professions of friendship, came to nothing. Henry had hardly left Francis when he met the emperor at Gravelines, where a formal alliance between them was confirmed by the betrothal of Charles to Henry's daughter Mary, then a child of four years. The protracted struggle between Charles and Francis at once began, though the following year (1521), at Calais, Wolsey did his utmost as ambassador of England to maintain the peace of Europe. The struggle proceeded with varying success till in 1525, at the battle of Pavia, Francis was brought to the verge of ruin by his own capture and the defeat of the most powerful army he had ever led into Italy. As the ascendency thus gained by the emperor endangered that balance of power at which Wolsey was ever aiming, England was now thrown into alliance with France. The sack of Rome by the emperor's troops in 1527

supplied Henry with still stronger reasons for joining France; and meanwhile domestic reasons were urging him in the same direction.

The leading events at home during these sixteen years may be briefly told. In 1521 the Duke of Buckingham, a descendant in the female line from the youngest son of Edward III., and, therefore, a possible claimant for the throne, was executed on a charge of treason. There was little foundation for the charge; but the death of this great noble man showed England that Henry, in spite of all his love of pleasure, was no ruler to be trifled with, while it gave continental princes a strong impression of his unlimited power over his subjects. The same year Henry published his famous book on the Sacraments in reply to Luther, and received from Pope Leo X. the title borne by all Henry's successors—*Fidei Defensor*, 'Defender of the Faith.' To enable him to play that part in continental affairs which he desired, Henry had frequent need of supplies beyond any of his predecessors. To raise these supplies Wolsey showed his devotion to the king by taking upon himself all the odium of frequent and excessive taxation. In 1523 he demanded of the House of Commons a subsidy of £800,000, to be raised by a tax of twenty per cent. on all goods and lands. After a vigorous protest by the house Wolsey carried his point; but the resistance he had met was a serious warning that there were limits beyond which even he could not safely proceed. To the country at large he made himself still further odious by the suppression of all monasteries with less than seven inmates. As he devoted the revenues of these monasteries to educational purposes, this action was in the best interests of the country; but the monks were still popular, and the people were not yet prepared for this high-handed dealing with a time-honoured institution. In 1525 Henry's expensive foreign policy again brought him into straits for money, and again Wolsey had to face popular feeling by the proposal of an illegal tax. The tax he now proposed is known as the Amicable Loan. On all sides it met with the strongest opposition, and Wolsey was forced to abandon his proposal, but 'people cursed the cardinal and his adherents as subversive of the laws and liberty of England.'

The turning-point in Henry's reign, as it is a great turning-point in the history of England, is the moment when the thought first occurred to him that at all costs his marriage with Catharine of Aragon must be dissolved. In taking a step which he knew to be fraught with the most far-reaching consequences to the nation Henry was determined by so many motives that it is hopeless to decide which at any one period carried it over the rest. Catharine was plain in personal appearance, cold by her natural temper, and six years older than her husband; all her children, except her daughter Mary, had died in infancy, and Henry professed (and we may believe honestly enough) to see in this the judgment of heaven on an unnatural alliance; any doubt of the legitimacy of Mary might lead to a renewal of the civil wars of the preceding century; the interest of England seemed now to point to France rather than Spain as her most advantageous ally, and Catharine did not conceal her disapproval of Henry's breach with her cousin the Emperor Charles; and, lastly, Henry had set his affections on another, Anne Boleyn, a niece of the Duke of Norfolk, who soon perceived the ascendency she had gained, and knew how to use it for her own purpose. With such various motives behind him, Henry, with all the passionate self-will of his nature, bent himself to accomplish his end. Pope Clement VII., who after the sack of Rome had every reason to dread and detest the influence of the emperor, was at first disposed to humour Henry's desire for a divorce, and in 1528 sent Cardinal Campeggio to England to try the validity of the king's marriage with Catharine. The visit of Campeggio, whose powers had been carefully guarded, settled nothing; and the pope under pressure from the emperor revoked the case to the Roman curia. This impotent conclusion was the ruin of Wolsey, who now found himself without a friend at home or abroad. The king blamed him for the failure of Campeggio's mission; Anne Boleyn, who was now all-powerful, looked on him as the only obstacle in the way of her ambition; and Catharine regarded him as the evil counsellor, who in his policy of opposition to the emperor was the main cause of all her misfortunes. In 1529, on an indictment for breach of *præmunire*, he was stripped of all his goods and honours, and dismissed from the court in disgrace. The next year he was summoned to London on a charge of high-treason, but broken in health and spirit died on the way, professing to the last his devotion to the king. 'No statesman of such eminence,' it has been said, 'ever died less lamented.' The people, who could not appreciate what he had done for England abroad in making her a power to be reckoned with in all the councils of Europe, saw in him only the haughty and vainglorious upstart, whose entire mode of life gave the lie to his office and profession.

The period from the fall of Wolsey to the fall of his successor, Thomas Cromwell, in 1540, is perhaps the most extraordinary, as it is, perhaps, one of the most important in all English history. During these years were broken link by link all the ties that bound England to the Papacy, and the country disparted from that system of the nations which men had come to regard as no less divinely ordered than the system of the heavens itself.

This severance of England from Rome was carried through by the parliament of 1529–36, summoned after an interval of seven years, and largely composed of the creatures of the king. Despite the coldness of the pope, Henry was as determined as ever on his divorce, and equally determined that he would not plead his cause at Rome, which would have been a direct admission of the papal supremacy. By way of relieving the scruples of the pope to reverse the judgment of his predecessors in favour of Henry's marriage, the case was submitted to the various universities of Europe. Their verdict was not unanimous, but the majority declared that Henry's scruples were justified. The pope, however, with the fear of the emperor ever before him, would not be moved from his position; and, meanwhile, the English parliament, inspired by the king, proceeded with its work. By humbling the clergy Henry doubtless thought he would be most likely to bring the pope to terms. Accordingly, one blow after another was struck at their privileges till they were taught that their real master was not the pope of Rome, but the king of England. In 1531 the whole body of the clergy, on the same grounds as Wolsey, were declared guilty of treason under the law of *præmunire*, and purchased the pardon of the crown only by the payment of £118,840. The same year he extorted from them his recognition as 'protector and supreme head of the church and clergy of England,' and the year following abolished the system of *annates* by which the pope received the first year's income of all newly-appointed bishops and archbishops. The tendency of all these acts could not be mistaken, and Sir Thomas More, who had succeeded Wolsey in the chancellorship, and who saw the inevitable end of Henry's policy, prayed to be relieved of the Great Seal. In further defiance of Rome, Henry (1533) was privately married to Anne Boleyn, in the teeth, also, as it

would appear, of public opinion, which all through had been on the side of Catharine. The year 1534 saw the definitive breach of England with Rome. By the parliament of that year it was enacted that all bishops should be appointed by a *congé d'élire* from the crown, and that all recourse to the bishop of Rome should be regarded as illegal. It was also enacted that the king's marriage with Catharine was invalid, that the succession to the crown should lie with the issue of Henry's marriage with Anne Boleyn, and that the king was the sole supreme head of the church of England. To this last act Bishop Fisher and Sir Thomas More, both men of the old order, but illustrious by their character and attainments, refused to swear, and both were executed the following year. In all his action against Rome Henry was eager that the world should understand that his quarrel was solely with the pope, and not with the doctrines of the church. The supporters of Luther, therefore, were treated with the same severity as the clergy of the old church who refused to acknowledge him in the place of the pope. To proclaim his soundness of doctrine he ordered (1537) the publication of the *Bishop's Book* or the *Institution of a Christian Man*, in which, with the exception of the headship of the pope, all the Catholic doctrines were set down after the strictest orthodoxy. It was the same anxiety to save his orthodoxy that prompted the famous *Statute of the Six Articles*, known as the *Bloody Statute*, in which all the fundamental doctrines of the Church of Rome are insisted on as necessary articles of belief—the severest penalties being attached to the denial of any one of them (1539).

In 1535, following the example of Wolsey, Henry appointed a commission under the direction of Thomas Cromwell to prepare a report on the state of the monasteries for the guidance of parliament. The report, contained in what is known as the *Black Book*, revealed a state of things that justified the most drastic dealing. The commissioners were strongly disposed to exaggerate whatever evils they found, and their report is to be taken for what it is worth; yet there is abundant testimony from friends and foes alike to prove that the monasteries had outlived their function, and that their general character was fitted to depress rather than elevate the moral ideal of the nation. On the strength of this report an act was passed for the suppression of all monasteries with a revenue under £200 a year. This high-handed dealing with an ancient institution brought to a head a widespread discontent with the late policy of Henry. In the north of England, especially, the sympathies of the people were mainly with the old religion, and the barons and country gentlemen were generally of the same way of thinking. The people, moreover, had a real grievance in the fact that everywhere there was much misery in the country, by reason of the land being extensively converted from agricultural to pastoral purposes, and its being bought up by speculators from the towns. The year following the suppression of the smaller monasteries, therefore, a formidable insurrection, known as the *Pilgrimage of Grace*, was organised in the northern counties under the leadership of a barrister named Robert Aske. The revolt was crushed and failed in all its objects, for the very next year Henry gave a final blow to the ancient church by the suppression of all the remaining monasteries. Henry's agent in this wholesale dissolution was Thomas Cromwell, the 'Hammer of the Monks,' who, after the king himself, was now the most powerful man in England. The removal of the monasteries was in the best interest of the country; but the manner in which Cromwell carried out the work is a revelation at once of the character of the man and the time. The revenues of the monasteries to the amount of £161,100 were devoted to small pensions for the abbots and priors, and the erection of six new bishoprics. The bulk of the revenues, however, passed to the crown and to those who had made themselves useful to the king.

We have again to return to the history of the king's marriages, which, in every case, it is to be remembered, have a more or less direct bearing on the policy of the reign. In 1536 Queen Catharine died, and the same year Anne Boleyn herself was executed in the Tower on the charge of infidelity to the king. The very day before her execution Henry was married to Jane Seymour, the only one of his wives for whom he appears to have had any real affection and respect. The next year Jane Seymour died, leaving a son, afterwards Edward VI. The succession being in the estimation of Henry and his ministers still insecure, Anne of Cleves was chosen as the king's fourth wife, in the hope of attaching the Protestant interest of Germany. Anne's personal appearance proved so little to Henry's taste that he consented to the marriage only on condition that a divorce should follow as speedily as decency would permit. Henry's disgust with Anne of Cleves was the immediate occasion of the ruin of his great minister Cromwell. As the agent of Henry's own religious policy Cromwell had made himself as generally detested as his predecessor Wolsey. It was mainly through his action that Anne had been brought forward, and his enemies used the opportunity of Henry's indignation to effect his ruin. Accused of high-treason by the Duke of Norfolk, he was executed on a bill of attainder, without the form of a trial (1540). On the day of Cromwell's death Henry married Catharine Howard, another niece of the Duke of Norfolk, and thus seemed to lend himself to the Catholic party represented by that nobleman. Before two years had passed Catharine suffered the same fate as Anne Boleyn, on the same charge, and in her case proved beyond dispute. In July 1543 Henry married his sixth and last wife, Catharine Parr, widow of Lord Latimer, a woman of character, who was happy enough to survive her husband.

During all these years the rivalry of Francis and the emperor had been the source of almost constant war, and Henry's interest in their struggle had been kept continually alive by the intrigues of France in Scotland. In 1543 Henry and Charles made a common invasion of France, which ended disgracefully for England by Francis and the emperor arranging a peace in which Henry's name was not even mentioned. In 1545 Francis made an abortive invasion of England, and the following year Henry retaliated by another invasion of France. At length, both monarchs being alike broken in health and spirit, they concluded a peace (1546), of which, by Francis's intervention, Scotland also had the benefit.

In his last years Henry suffered much from an ulcer in his leg, which seems at times to have goaded almost to madness a temper never very tractable or uniform. The execution of the young Earl of Surrey, son of the Duke of Norfolk, on a charge of high-treason, completes the long list of the judicial murders of Henry's reign. Norfolk himself was saved from the same fate only by the death of Henry himself, January 28, 1547.

From the revolting record of his conjugal relations and the long list of noble victims that make his rule a veritable reign of terror, Henry is apt to be hastily judged simply as an unnatural monster, borne along by motives of cruelty and lust. Yet it cannot be questioned that from first to last he was popular with all ranks of his people, and that

he inspired the most devoted affection of those in immediate contact with him. 'Had Henry been the wilful, capricious, and self-indulgent monarch he is sometimes represented,' says Professor Brewer, 'the intense personal devotion of such men as Wolsey, Cromwell, More, Gardiner, and Fitzwilliam, so unlike each other in all respects, this one excepted, would have been the most unintelligible paradox in history.' In the point of personal morals Henry was purity itself compared with his contemporaries Francis and James V. of Scotland. In the sense of kingly responsibility, also, he bears the most favourable comparison with the French king. Even in the shedding of blood Henry was merciful compared with Francis. In the case of the victims of the Bloody Statute, and even in the case of the deaths of such men as More and Fisher, we are bound to admit that Henry had a certain justification in principle and in the interest of the country. But in the wholesale massacre of the Protestants by Francis we have simply the gratuitous act of a monarch devoid himself of all religious conviction, prompted by the momentary caprice of selfish interest. Only a prince of the most imperious will could have effected the ecclesiastical revolution that makes Henry's reign perhaps the most important in English history. At the same time, the whole past policy of England towards Rome had its necessary result in Henry's rejection of his papal supremacy. By the law of *præmunire* the power of the pope had ceased to be more than a form, and it only required an occasion such as the divorce of Catharine, and a king with the resolution of Henry, to snap the bond that was already worn to the extremest tenuity. In the suppression of the monasteries, also, Henry in reality acted in accordance with the highest consciousness of the nation. The mass of the people were unfavourable to the revolution, but that section of the community which represented the moral sense of the nation was all on the side of Henry. It is in his manner of carrying out what was a necessary revolution, in his coarseness of nature, which deserves the harsher name of sheer brutality, that the instinctive feeling of revulsion against Henry finds its real justification.

Brewer, edited by J. Gairdner (2 vols. 1884) from the prefaces to the Rolls publications; Mandell Creighton's *Cardinal Wolsey* (1888); Stubbs's *Lectures on Mediæval and Modern History* (1887); and Gasquet's *Dissolution of the English Monasteries* (2 vols. 1889).

Henry, Prince of Wales. See James I.

Henry, surnamed The Lion (1129–1195), Duke of Saxony and Bavaria, was the son of Henry the Proud, and the head of the Guelphs. After Bavaria, which had been taken from his father, was restored to him (1154) by the Emperor Frederick I., he became the most powerful noble in Germany, his possessions extending from the North Sea and the Baltic to the shores of the Adriatic. His great power and his ambitious designs roused against him a league of princes, ecclesiastical and temporal, in 1166; but Henry, with the emperor's countenance, was able to make head successfully against his enemies. Frederick I. at length grew alarmed, deprived Henry of his dominions and placed him under the ban of the empire in 1180. Nor was he fully reconciled to Frederick's successor, Henry VI., until about three years before his own death. Henry the Lion pursued an enlightened policy in ruling his dominions, in that he encouraged agriculture and trade; he fostered the commerce of Hamburg and Lübeck, and was the founder of Munich.

Henry III., emperor of Germany, only son of the Emperor Conrad II., was born on 28th October 1017, elected king of the Germans in 1026, Duke of Bavaria in 1027, Duke of Swabia in 1038, and succeeded his father as emperor in 1039. A man of stern though pious disposition, he resolutely maintained the imperial prerogatives of power, and encouraged the efforts of the Clugniac monks to reform the ecclesiastical system of Europe. Having summoned a council at Sutri in 1046, he put an end to the scandalous intrigues of the rival popes, Benedict IX., Sylvester III., and Gregory IV., by deposing all three and securing the election of Clement II. in their stead. In 1042 he compelled the Duke of Bohemia to acknowledge himself a vassal of the empire. The outcome of repeated campaigns in Hungary was the establishment of the supremacy of the empire over that kingdom in 1044. Henry also stretched his authority over the Norman conquerors of Apulia and Calabria. He died suddenly at Bodfeld, in the Harz country, on 5th October 1056. He was a zealous promoter of learning and the arts, especially music. He founded numerous monastic schools, over which he placed learned monks of Brittany, and built several churches, including the cathedrals of Worms, Mainz, and Spires, in the last of which he was buried. See Steindorff, *Jahrbücher des Deutschen Reichs unter Heinrich III.* (1874–81).

Henry IV., emperor of Germany, was born at Goslar on 11th November 1050, elected king of the Germans in 1054, and succeeded his father, Henry III., in 1056, his mother being named regent of the empire. She was soon ousted by the Archbishop of Cologne, and he in turn by the Archbishop of Bremen. About 1070 Henry began to act for himself. His first care was to break the power of the nobles of the land; but his measures provoked a rising of the Saxons, who in 1074 forced upon Henry humiliating terms of pacification. In the following year he defeated them in a great battle at Hohenburg, and then proceeded to take vengeance upon the princes, secular and ecclesiastical, who had ventured to contest power with him. The case of the latter gave the pope, Gregory VII., the pretext he longed for to interfere in the affairs of Germany. This was the beginning of the great duel between pope and emperor which has been already recorded under Gregory VII. (q.v.). This conflict between the representatives of secular and ecclesiastical power was marked by several dramatic events. In 1076 Henry declared the pontiff deposed. Gregory VII. retaliated by excommunicating Henry and absolving his subjects from all obedience to him. The king, seeing his vassals and princes gradually falling away from their allegiance, hastened, in midwinter, to Italy to make submission to the pope. For three days in January 1077 he was compelled to stand in the courtyard of the castle of Canossa, exposed to the inclemency of the weather, barefooted, and clothed only in the haircloth shirt of a penitent, before the pontiff consented to remove the ban of excommunication. Then, having found adherents among the Lombards, Henry renewed the conflict, but was again excommunicated. His counter-move to this was to appoint a new pope, Clement III., and to hasten over the Alps and lay siege to Rome. Henry in 1084 got possession of the city and caused himself to be crowned emperor by the antipope. Gregory, who had taken refuge in the castle of San Angelo, was only saved by the approach of Robert Guiscard at the head of the Italian and Sicilian Normans. In Germany, during Henry's long absence in Italy, three rival kings of the Germans successively found support amongst the princes. But Henry managed to triumph over them all. Crossing the Alps for the third time, he in 1090 restored the fortunes of his

friend, Clement III., took Mantua, and was rapidly subduing the Guelphic princes and their pope, Urban II., second successor to Gregory, who had died in 1085, when he learned that his son Conrad had joined his enemies and been crowned king at Monza. The wearied monarch, disheartened by this adverse blow, retired to one of his Lombard castles, and abandoned himself to despair. But at length rousing himself from his lethargy, he returned (1097) to Germany. His second son, Henry, was elected king of the Germans and heir to the empire. This prince, however, was induced to rise against his father by Pope Pascal II.; he took the emperor prisoner, and compelled him to abdicate. The emperor escaped from his prison, and found friends and safety at Liège, where he died, August 7, 1106. Henry deserved praise for the endurance and tenacity with which he struggled against the tremendous odds arrayed in opposition to him. That he was able to stand his ground at all, considering the magnitude of the task he took in hand—to break the overweening power of the great feudal nobles of Germany and to withstand papal aggressiveness incorporated in the person of a Gregory VII.—must be reckoned success of no mean character. See Floto, *Heinrich IV. und sein Zeitalter* (2 vols. 1855–57); Giesebrecht, *Geschichte der Deutschen Kaiserzeit* (vol. iii. 4th ed. 1876); and Minckwitz, *Die Busse Heinrichs des IVten* (2d ed. 1875).

Henry II., king of France, was born at St Germain on 31st March 1519, was married to Catharine de' Medici in 1533, and succeeded his father, Francis I., in 1547. Although an ambitious and stout-hearted prince, Henry suffered himself to be influenced by favourites, women mostly (such as Diana of Poitiers, q.v.). Immediately after his accession he proclaimed himself of the Catholic party, and proceeded to oppress his Protestant subjects. Through the influence of the Guises, whose sister, the dowager-queen of James V. of Scotland, sought the aid of France to support her against the English government, Henry formed an alliance with Scotland, and declared war against England, which ended in 1558 with the taking of Calais, after that city had been 210 years in the hands of the English. In spite of his Catholic proclivities, ambition made him renew the duel with the empire that his father had begun. In 1552 he concluded treaties of alliance with the German Reformers, and sent an army to aid Maurice of Saxony against the emperor. His troops captured Toul and Verdun, while Montmorency seized upon Metz. After a lull in the hostilities war was renewed in 1556. In the following year Guise's design to conquer Naples was frustrated by the generalship of Alva, whilst in the Low Countries the French under Montmorency sustained a crushing defeat at St Quentin. These reverses were followed by the treaty of Cateau-Cambresis (1559). Shortly afterwards Henry was accidentally wounded in a tournament by Montgomery, a Scottish nobleman and captain of his guard. He died from the wound on 10th July 1559. See works cited at FRANCE and CATHARINE DE' MEDICI.

Henry III., king of France, the third son of Henry II. and Catharine de' Medici, was born at Fontainebleau on 19th September 1551. On the death of Constable Montmorency he received the chief command of the army, and in 1569 gained two decisive victories over the Protestants at Jarnac and Moncontour. He showed his zeal for the Catholic cause by taking an active share in the massacre of St Bartholomew. In 1573 the intrigues of the queen-regent secured his election to the throne of Poland. But on receiving the tidings of the death of his brother, Charles IX., he fled by night from Cracow and came home to France to succeed Charles as king (1575). His reign was a period of almost incessant civil war between the Huguenots and the Catholics. The party of the latter, supported by the king's mother, and headed by Henry of Guise, formed the Holy League, the object of which was not merely to assert the undivided supremacy of Catholicism, but also to secure the reversion of the throne to the family of the Guises. Henry was quite unfitted to cope with the crisis. He showed both fickleness and want of courage in his public conduct; and in private life his days and nights were spent in an alternation of dissolute excesses and wild outbreaks of religious fanaticism. His favourite companions were a band of young men (the 'Mignons') as vicious as himself. At length in 1588 the assassination of the Duke of Guise in the king's antechamber, and of the Duke of Lorraine in prison, fairly roused the Catholic part of the nation to the utmost pitch of exasperation. The distracted king threw himself into the arms of Henry of Navarre, and the two sovereigns marched upon Paris at the head of a Huguenot army. But on 1st August 1589 Henry of France was stabbed by a fanatical Dominican named Jacques Clément; he died on the following day, nominating Henry of Navarre as his successor. With this king the male line of the house of Valois became extinct. See M. W. Freer, *Henry III., his Court and Times* (3 vols. 1858).

Henry IV., king of France and Navarre, surnamed 'the Great,' and 'the Good,' was born at Pau, 13th Dec. 1553. He was the third son of Antoine de Bourbon and Jeanne d'Albret, daughter and heiress of Henry, king of Navarre and Bearn. His father's death placed him under the sole control of his mother and grandfather, at whose court he was trained to the practice of knightly and athletic exercises, and inured to the active habits and rude fare common to the Bearnais mountaineers. His mother, who was a zealous Calvinist, was careful to select learned men holding her own tenets for his instructors; and having discovered that a plot was on foot to remove him to Spain by force, to train him in the Catholic faith, she conducted him, in 1569, to La Rochelle, and presented him to the assembled Huguenot army, at whose head he fought at the battle of Jarnac. Henry was now chosen chief of the Protestant party—although, on account of his youth, the principal command was vested in Coligny (q.v.)—and the third of the Huguenot wars began. Notwithstanding the defeats which the Huguenots had experienced in the next campaign, the peace of St Germain which concluded it was apparently most advantageous to their cause, and was speedily followed by a contract of marriage between Henry and Margaret of Valois, the sister of Charles IX. After much opposition on the part of both Catholics and Protestants, the marriage was celebrated with great pomp in 1572, two months after the sudden death of the Queen Jeanne, which was probably due to poison, and within less than a week of the massacre of St Bartholomew. It had been originally intended that Henry was to share the fate of his friends and co-religionists; but his life was spared on condition of his professing himself a Catholic. Three years he remained at the French court, virtually a prisoner; but at length, in 1576, he contrived to elude the vigilance of the queen-mother, and escaped to the camp of the Huguenots in Alençon. There, having revoked his compulsory conversion, he resumed the command of the army, and by his address gained several signal advantages, which constrained the king to consent to a peace highly favourable to the cause of the Reformers.

The death of the Duke of Anjou (late Alençon) gave Henry the rank, as first prince of the blood-

royal, of presumptive heir to the crown; while the murder of Henry III. in 1589 made him, in right of the Salic law, and as the nearest lineal male descendant of the royal house of France, rightful king of France. As a Protestant, lying under the ban of papal excommunication, he was obnoxious to the greater part of the nation; and finding that the Dukes of Lorraine and Savoy, and Philip II. of Spain, were prepared, each on his own account, to dispute his claims, he retired to the south until he could collect more troops and obtain reinforcements from England and Germany. His nearly hopeless cause, however, gradually gained strength through the weakness and internal dissensions of the Leaguers, who, in their anxiety to circumvent the ambitious designs which Philip II. cherished in favour of his daughter (niece of Henry III.), notwithstanding her exclusion by the Salic law, proclaimed the aged Cardinal Bourbon king, with the Duke of Mayenne lieutenant-general of the kingdom, and thus still further complicated the interests of their party. In 1590 Henry won a splendid victory over Mayenne at Ivry. In 1593 the assembly of the States-general, by rejecting the pretensions of Philip II., and insisting on the integrity of the Salic law, smoothed Henry's way to the succession, although it is probable that he would never have been generally acknowledged had he not, by the advice of his friend and minister, De Rosny, afterwards Duc de Sully (q.v.), formally professed himself a member of the Church of Rome. The ceremony of his recantation of Protestantism, which was celebrated with great pomp at St Denis in July 1593, filled the Catholics with joy, and was followed by the speedy surrender of the most important cities of the kingdom, including even Paris, which opened its gates to him in 1594. The civil war was not, however, wholly put down till four years later. In the same year, 1598, peace was concluded between Spain and France by the treaty of Vervins, which restored to the latter many important places in Picardy, and was otherwise favourable to the French king; but, important as was this event, it was preceded by a still more memorable act, for on the 15th April Henry had signed an edict at Nantes by which he secured to Protestants perfect liberty of conscience and the administration of impartial justice.

Henry was now left at liberty to direct his attention to the internal improvements of the kingdom, which had been thoroughly disorganised through the long continuance of civil war. The narrow-minded policy that had been followed during the preceding reigns had left the provinces remote from the capital very much at the mercy of the civic governors and large landed proprietors, who, in the absence of a general administrative vigilance, arrogated almost sovereign power to themselves, raising taxes and exacting compulsory services. These abuses Henry completely stopped, and by making canals and roads, and thus opening all parts of his kingdom to traffic and commerce, he established new sources of wealth and prosperity for all classes of his subjects. The mainspring of these improvements was, however, the reorganisation of the finances under Sully, who, in the course of ten years, reduced the national debt from 330 millions to 50 millions of livres, although arrears of taxes to the amount of 20 millions were remitted by the king during that period. On 14th May 1610, the day after the coronation of his second wife, Mary de' Medici, and when about to set out to commence war in Germany, Henry was assassinated by a fanatic named Ravaillac. Nineteen times before attempts had been made on his life, most of which had been traced to the agency of the papal and imperial courts, and hence the people, in their grief and consternation, laid Ravaillac's crime to the charge of the same influences. The grief of the Parisians was well-nigh delirious, and in their fury they wreaked the most horrible vengeance on the murderer, who, however, had been a mere tool in the hands of the Jesuits, Henry's implacable foes, notwithstanding the many concessions which he made to their order.

According to Henri Martin, Henry 'remains the greatest, but above all the most essentially French of all the kings of France.' His unbridled licentiousness was his worst fault, and the cause of much evil in his own and succeeding reigns; for his prodigality and weak indulgence to his favourite mistresses, Gabrielle d'Estrées and Henrietta d'Entragues, and his affection for the natural children which they bore him were a scandal to the nation, and a source of impoverishing embarrassment to the government.

As authorities in regard to Henry II., III., and IV., in addition to the general histories of France, the following works may be consulted: Anquetil, *Esprit de la Ligue*; Petitot's *Collection of Memoirs*; De la Saussaye, *Histoire de Blois*, *Documents de l'Hist. de France*; Matthieu, *Hist. de Henri IV.*; Memoirs and Letters of Sully, De Thou, D'Aubigné, Pasquier, Duplessis-Mornay; Capefigue, *Hist. de la Réforme et de la Ligue*; Perefixe, *Hist. de Henri IV.*; M. W. Freer, *History of the Reign of Henry IV.* (6 vols. 1860–63); H. de la Ferrière's *Henri IV.* (1890); Bingham's *Marriages of the Bourbons* (1889); and monographs by P. F. Willert (1893) and E. T. Blair (Phila. 1894).

Henry V. OF FRANCE. See CHAMBORD.

Henry, surnamed THE NAVIGATOR (Dom Henrique el Navegador), a famous Portuguese prince, the fourth son of João I., king of Portugal, was born at Oporto in 1394, and first distinguished himself at the conquest of Ceuta in 1415. After the death of his father he took up his residence at the town of Sagres, in Algarve, near Cape St Vincent; and while prosecuting the war against the Moors of Africa, his sailors reached parts of the ocean heretofore unvisited and unknown. The grand ambition of Henry was the discovery of unknown regions of the world. At Sagres he erected an observatory, to which he attached a school for the instruction of youthful scions of the nobility in the sciences necessary to navigation. Subsequently he despatched some of his pupils on voyages of discovery, which resulted at last in the discovery of the Madeira Islands in 1418. Henry's thoughts were now directed towards the auriferous coasts of Guinea, of which he had heard from the Moors; and in 1433 one of his mariners sailed round Cape Nun, until then regarded as the farthest point of the earth, and took possession of the coasts as far south as Cape Bojador. Next year Henry sent out a larger ship, which reached a point 120 miles beyond Cape Bojador; and at last, in 1440, Cape Blanco was reached. Up to this period the prince had borne all the expense of these voyages himself; henceforth, self-supporting societies were formed under his patronage and guidance, and what had formerly been the affair of a single individual now became the passion of a whole nation. But Henry did not slack personally in his efforts. In 1446 his captain, Nuno Tristam, doubled Cape Verd in Senegambia, and in 1448 Gonzalez Vallo discovered three of the Azores. Henry died in 1460. A great national celebration of his memory took place in Portugal in 1894. Henry's mother was the English Philippa, daughter of John of Gaunt.

See works by Wappaus (Gott. 1842) and De Veer (Koningsb. 1864); the *Life* and the *Discoveries* of Henry, both by Major (1868 and 1877); and a short work by Raymond Beazley (1895).

Henry of Huntingdon, English chronicler, was brought up in the household of the Bishop of Lincoln, and about 1120 became Archdeacon of Huntingdon. His *chef d'œuvre* is the *Historia*

Anglorum, coming down to 1154. Besides this he wrote several epistles on historical matters and some poems. His *History* was published for the Rolls series by T. Arnold in 1880; an English translation by T. Forrester appeared in 1853. See Gairdner's *Early Chroniclers of Europe* (1879).

Henry the Minstrel. See HARRY (BLIND).

Henry, JOSEPH, physicist, was born either in 1797 or 1799, in Albany, New York. There, while apprenticed to a watchmaker, he took up the study of science, and earned means to carry him through the course at the academy, in which institution he became instructor in Mathematics in 1826. In 1832 he was called to the chair of Natural Philosophy at Princeton; in 1846 he was elected the first secretary of the Smithsonian Institution, and removed to Washington, where he died, 13th May 1878. Apart from his great services to the Smithsonian Institution, with Henry's name are associated the discovery of a relation between the number of coils of wire round the electro-magnet and the construction of the battery to work it, which prepared the way for Morse's invention, in which his principles were applied to make the instrument effective at a distance; the discovery of a singular form of electrical induction; researches in meteorology and acoustics; and the establishment of the national lighthouse board, of which he was chairman from 1871 until his death. He was LL.D. of Union (1829) and Harvard (1851), and a member of many scientific societies in America and Europe. Of his numerous papers 2 vols. were published in 1886; and a *Memorial* was published by order of congress in 1880.

Henry, MATTHEW, Nonconformist divine, the son of Philip Henry, one of the 2000 ministers who left the Church of England on the passing of the 'Act of Uniformity,' was born at Broad Oak farmhouse, in Flintshire, October 18, 1662. In 1687 he became pastor of a congregation of dissenters at Chester, where he remained until May 1712, when he removed to a charge at Hackney, near London. He died of apoplexy, June 22, 1714, at Nantwich, while on his return from a visit to his old friends at Chester. His principal work is an *Exposition of the Old and New Testament*, in 5 vols. folio (1710 and repeatedly since), which was carried down only to the Acts of the Apostles. The remainder was completed after Henry's death by various ministers, whose names are given in some of the editions. This commentary is not a critical work, but rather practical and devotional in its aim, and as such occupies a high place amongst works of its class. Henry wrote several other books, which were published at London in 1830. There are biographies of him by Tong (1716), J. B. Williams (1865), Davies (1844), Hamilton (1853), and Chapman (1859); and see the *Diaries and Letters of Philip Henry*, edited by Matthew Henry Lee (1883).

Henry, PATRICK, a great American orator and patriot, was born in Hanover county, Virginia, 29th May 1736. His father was a native of Scotland, his grandmother a cousin of Robertson the historian. Henry received a share of classical education, but at an early age entered business, and married at eighteen. Having failed successively in 'store-keeping' and in farming, he became a lawyer in 1760, and three years later found his opportunity, when, having been employed to plead the cause of the people against an unpopular tax, his great eloquence seemed suddenly to develop itself. This defence placed him at once in the front rank of American orators, and his later speeches advanced him to their head. From amid the sullen murmurs and remonstrances that the passage of the stamp-act evoked, his voice it was that first rose in a clear, bold call to resistance. Throughout the war of independence he was a zealous patriot. He was a delegate to the first Continental congress, which met at Philadelphia in 1774, and delivered the first speech in that assembly —a speech that for fiery eloquence and lofty tone was worthy of so momentous a meeting. In 1776 he carried the vote of the Virginia convention for independence; and in the same year he became governor of the new state. He was afterwards four times re-elected. In 1791 he retired from public life, and returned to his practice; in 1795 he declined the secretaryship of state offered him by Washington. He died 6th June 1799. Henry was an able administrator, a wise and far-seeing legislator; but it is as their greatest orator that his memory lives in the minds of most Americans. No one who has come after has approached him in ability to stir and sway the passions of an audience. The classical Life is that by William Wirt; others are Everett's, in Sparks's *American Biography*, Tyler's (1887), and W. W. Henry's (3 vols. 1891).

Henry, ROBERT, a Scottish historian and divine, was born at St Ninians, in Stirlingshire, February 18, 1718. He studied at the university of Edinburgh, and from 1768 till his death in 1790 was one of the ministers of that city. In his *History of Great Britain on a New Plan* (6 vols. 1771–93) he adopted the 'new plan' of devoting chapters to the social aspects of successive periods, and thus tracing the progress of civilisation in Great Britain; but the work has no pretensions to critical acumen or even strict accuracy, and consequently is now of little value.

Henry, WILLIAM, a chemist, was born at Manchester, 12th December 1774, and died on 2d September 1836 at Pendlebury near that city. In 1795 he began to study medicine at Edinburgh, but at the end of his first session he returned home to superintend a chemical business which had been established by his father, and it was not until 1805 that he was able to resume his studies at Edinburgh. He only practised for a short time in Manchester, preferring to devote himself to original investigation in chemistry. He was the author of some very valuable papers in the *Philosophical Transactions* (chiefly on the chemistry of the gases); and his *Elements of Experimental Chemistry*, in two volumes, which was published in 1799, reached an eleventh edition in 1829. Henry was awarded by the Royal Society the Copley gold medal in 1809. The Memoirs of the Manchester Society are chiefly indebted to him and to Dalton for their high scientific character.

Henryson, ROBERT, Scottish poet, was born about 1425, and was most likely educated abroad. He is usually designated schoolmaster of Dunfermline, and he seems besides to have practised there the profession of a notary. His death may safely be put about the end of the 15th century. Of his poems the most important is his *Testament of Cresseid*, in the form of a kind of supplement to Chaucer's poem on the same subject. Another, *Robene and Makyne*, is especially interesting as the earliest extant specimen in the Scottish dialect of pastoral poetry. Other works are a metrical version of thirteen of the *Fables of Æsop*, with morals suited to the questions of the time, and the somewhat feeble *Orpheus and Eurydice*. All previous editions of Henryson's poems were superseded by that of Dr David Laing (Edinburgh, 1865).

Henslowe, PHILIP, a stage-manager in Shakespeare's time, was originally a dyer and starch-maker, but became in 1584 lessee of the Rose theatre on the Bankside. From 1591 till his death in 1616 he was in partnership with Edward Alleyn, (q.v.), who married his step-daughter in 1592. Henslowe's business diary from the year 1593

to 1609 has fortunately been preserved at Dulwich College, and contains invaluable information about new plays and all the stage business of Shakespeare's day. It was edited by J. Payne Collier for the Shakespeare Society in 1841, but his reprint is unreliable, marred by many ugly interpolations and worse.

Hepar (Gr. *hepar*, 'the liver') is the name given by the older chemists to various compounds of sulphur, from their brown, liver-like colour. *Hepatic* means belonging to the liver; as, *hepatic* artery, vein, duct, &c. *Hepatica* is a term for medicines which affect the liver and its appendages.

Hepatica, a genus of hardy perennial plants belonging to the natural order Ranunculaceæ, closely related to Anemone, and formerly included in that genus under the name *A. Hepatica*. *H. triloba* is the best known species, and has long been extremely popular in the flower-garden on account of its flowering in early spring in great profusion; the flowers of the several varieties being also very brilliantly coloured. The normal colour of the species appears to be purple, but there are varieties with red, deep blue—of these there are single and double-flowered forms—and pure white flowers. It is a native of many hilly parts of Europe. Its roots are powerfully astringent, but have not the acrid qualities possessed by many of the Ranunculaceæ. *H. angulosa* is the only other species known to cultivation; it is larger in all its parts; the flowers are pale blue. It is a native of Transylvania, and both species delight in partial shade rather than full exposure to the sun. For another kind of Hepatica, see LIVERWORTS.

Hepatitis (Gr. *hēpar*, 'the liver'), inflammation of the Liver (q.v.).

Hephæstus, the god of fire and of smithying among the Greeks, is represented by Homer as lame, walking with the aid of a stick, and panting as he goes. His character is good-tempered, affectionate, and compassionate (cf. Æsch. *Prometheus Bound*). There is also an element of the comic connected with him; his gait and ungainly figure provoke the laughter of the gods. On the other hand, he is himself given to practical jokes; he constructs a seat on which his mother sits down, but from which she is unable to rise. His mother was Hera, who (according to Homer) liked her lame child so little that she cast him far out from heaven. Another account of his fall from heaven is also given by Homer—that Zeus threw him out for siding with Hera against him. The story of the seat just mentioned is brought into connection with the former version of his fall; none but he could release Hera, nor would he help her until restored to his place in heaven. Mythologists interpret the fall of Hephæstus as the fall of lightning from the sky (= Hera, but see HERA). Amongst the myths in which Hephæstus is concerned we must mention that of the manufacture of the first woman, Pandora (by whom all evil came into the world); the birth of Athene from the head of Zeus, when Hephæstus with an axe acted as midwife; and the birth of Erichthonios, who claimed Hephæstus for father, and from whom the Athenians counted themselves as descended.

In discussing the origin and antiquity of Hephæstus it is necessary to bear in mind that this deity appears under two aspects, which would naturally come to be combined though they were not necessarily united from the first. Hephæstus is the god of smithying and also the god of fire. To begin with the latter aspect of the deity, there are so many points of resemblance between the divine smith of the Greeks and the Wayland Smith (q.v.) or Wieland or Volundr of the northern members of the Indo-European family of peoples that some comparative mythologists have felt justified in inferring that the divine smith was a conception known to the Indo-Europeans before their dispersion. On the other hand, it is maintained that the resemblances are due, not to the joint inheritance by different peoples of the same original myth, but to borrowing at a late period. The stories of Wieland were a conscious loan on the part of the Teutons, in the 6th century A.D., of various classic tales about Dædalus and Vulcan (W. Golther, *Germania*, *xd.* xxiii. 449). This latter view has in its favour the fact that the undivided Indo-Europeans were unacquainted with the metals, except copper, and totally ignorant of the art of smithying. The divine smith, therefore, is a mythological conception which must be posterior to the dispersion of the Indo-Europeans. Remains the question then whether the other aspect under which Hephæstus appears, that of the god of fire, goes back to primeval times. On the one hand, other Indo-European peoples have fire-gods of their own; the Hindus Agni, and the Norsemen Loki. But, unfortunately, there is no phonetic identity between the names of the various deities. We have therefore nothing beyond general considerations to guide us. The want of philological equivalence in the names of various fire-gods makes rather against the supposition that the primitive Indo Europeans recognised a god of fire. On the other hand, there is no improbability inherent in the assumption that they were at least as far advanced as the Australian aborigines who worship fire. The fact that several members of the Indo European family agree in the worship of a fire-god does not, of course, demonstrate that the worship was a joint inheritance, for the worshipper's idea of worshipping so useful an element occurs independently to peoples who cannot be supposed on any theory to be connected. Finally, the lameness of Hephæstus may be an expression of the unsteady, flickering motion of flame; but it is well to remember that amongst savages the people to whose lot it particularly falls to tend the fire are the lame.

Hephæstus was by the Romans identified with their own fire-god Vulcan (q.v.).

Heptam'eron. See MARGARET OF NAVARRE.

Heptarchy, the name sometimes applied to the seven kingdoms supposed to have been established by the Saxons in England. The term is completely misleading if it be taken to mean that there were neither more nor less than seven distinct kingdoms in the country down to the time of Egbert; but is permissible enough if taken to mean only that the chief kingdoms at various periods from the 5th to the 9th century were Wessex, Sussex, Kent, Essex, East Anglia, Mercia, and Northumbria (see ENGLAND). The shadowy sovereignty of the Bretwalda is discussed under that head.

Heptateuch, a word sometimes used for the first seven books (Gr. *hepta*, 'seven;' *teuchos*, 'instrument,' 'volume') of the Old Testament—formed on the analogy of Pentateuch and Hexateuch. See BIBLE, Vol. II. p. 119.

Hera, the daughter of Kronos, the sister and at the same time the wife of Zeus, was the Greek goddess of marriage, child-birth, and menstruation. In the *Iliad* she takes the part of the Greeks, and hates the Trojans, because Paris awarded the fatal apple of discord to Aphrodite. She is the mother of Hephæstus, the god of fire, of Ares, the god of war, of Eileithyia, of Hecate, and of Hebe. Three towns, according to Homer, are especially dear to her—Argos, Sparta, and Mycenæ. She is represented by the poet as jealous and ill-tempered. As the goddess of lawful marriage she persecutes the illegitimate offspring of her consort Zeus, such as Heracles and Dionysus. She conspires against

Zeus, who makes reprisals by hanging her up from heaven with golden fetters on her hands and a couple of anvils on her feet. In consequence she subsequently preferred to thwart him secretly rather than defy him openly.

Many interpretations of this figure in mythology have been given in ancient and in modern times: Empedocles and Euripides regarded her as the goddess of the earth; Plato, and after him the Stoics, as the goddess of the clouds. In modern times she has been regarded as the goddess of the lower air, which is, like Juno in Virgil, *varium et mutabile semper*, in contrast to Zeus, who is the god of the serene and upper ether. Roscher (*Stud. z. Vergl. Myth. d. Griechen u. Römer*) interprets her as a moon-goddess of Græco-Italian times. He bases this view on the fact that she resembles all other moon-goddesses in being the goddess of women, and in presiding over menstruation and child-birth; in possessing as her attributes the torch, the bow, and the crown of stars; in the fact that the new moon was the time for her festivals, and finally, on the resemblance between Hera and Juno. As regards the resemblance between these two goddesses, they are each the spouse of the supreme god of the sky, they have the same functions relatively to women, their cult and attributes are similar; and finally, the ancient Epirotic name for Hera was Dione, which corresponds phonetically to Juno.

The ancient identification of Hera with the earth may at once be dismissed. There is no resemblance between Hera and Gaia, or any other chthonian (earth) deity. Nor can she be regarded as a goddess of the lower air: goddesses of the air are unknown to any related people, and no primitive tribe (or any other tribe than that of mythologists) would distinguish between the lower air and the serene ether. If it is an unalterable canon of mythology that all deities must be nature-myths of some kind, then Roscher's interpretation of Hera as a moon-goddess is the most probable. Otherwise we may be content to seek the origin of Hera simply in the necessity under which the worshippers of Zeus lay of providing him with a spouse. And here it becomes a point of some importance to determine at what period Hera was created—whether before the dispersion of the Indo-Europeans, or after their dispersion, and while the joint-ancestors of the Greeks and Italians yet lived together in a Græco-Italian period, or in purely Greek times. Now, no one claims that Hera dates from before the dispersion of the Indo-Europeans—i.e. from the time when Zeus, though the supreme god, was still to the average Indo-European mind also and always the sky. Nor can Roscher be said to have made out his case for the Græco-Italian origin of the goddess: the fact that Dione in one part of Greece was once the supreme goddess, and was dethroned by Hera, is not enough to prove that Hera was generally, or indeed ever, known as Dione; and, further (to say nothing of the fact that Diana rather than Juno is the phonetic equivalent of Dione), there is no identity between the mythological functions of Dione and Juno on the one hand, or of Dione and Hera on the other. As for the resemblances of Hera and Juno, they are not greater than might reasonably be expected: Greeks and Italians, alike inheriting the sky-god (not from a Græco-Italian period, the very existence of which is doubtful, but from primitive times), would alike feel the necessity of providing him with a wife; and if in both cases the wife of the supreme god came to be regarded as the goddess of marriage, and of all appertaining to it, the coincidence is not astonishing when we reflect on the considerable similarity between the two peoples. If then Hera does not date from before purely Greek times, the necessity for interpreting her as a nature-myth is considerably weakened, for as long as Zeus was but the sky we should expect that he could only be married to some nature-power; but when the personality of the god had come to be usually conceived apart from the element from which he originated, we should expect that his consort would be in mythology what she undoubtedly was in art—merely the feminine counterpart of the supreme deity. And, finally, on this view Hera's resemblance to moon-goddesses would be the result of her position as the goddess of marriage, instead of her position as the goddess of marriage being the result of a lunar origin.

Heracleia, an ancient city of Magna Græcia, situated near the river Aciris, about 3 miles from the Gulf of Tarentum. It was founded about 432 B.C., and under the Romans became a prosperous and refined city, though it never acquired any historical prominence. Near it, however, Pyrrhus defeated the Romans in 280 B.C. In the neighbourhood, besides a large number of coins, ranking among the very finest relics of antiquity, there have been discovered (1753) two bronze tablets (*Tabulæ Heracleenses*), containing a copy of the *Lex Julia Municipalis* (45 B.C.), and forming one of the principal authorities for a knowledge of the municipal law of ancient Italy. This inscription has been published by Muratori, Savigny, and others. Two other cities of this name deserve mention: (1) HERACLEIA MINOA, between Agrigentum and Selinus, on the south coast of Sicily, originally a Phœnician town; and (2) HERACLEIA PONTICA, on the coast of the Black Sea in Bithynia, destroyed by Cotta in the Mithridatic war.

Herac'lian, an officer of the Emperor Honorius (q.v.), who as governor of the province of Africa rendered good service during the invasion of Alaric. He became consul, but, revolting against Honorius, was defeated on invading Italy (413 A.D.), and slain soon after in Africa.

Heracli'dæ means, in its widest sense, all 'the descendants of Heracles' (Hercules), but is specially applied to those adventurers who, founding their claims on their supposed descent from the great hero (to whom Zeus had promised a portion of the land), were said to have joined the Dorians in the conquest of the Peloponnesus. Several expeditions were undertaken for this purpose, the last and greatest occurring eighty years after the Trojan war. The chiefs of the invaders defeated Tisamenus, son of Orestes, and grandson of Agamemnon, and took possession of the Peloponnesus. See GREECE.

Heracli'tus (Gr. *Hērakleitos*), a Greek philosopher, was born at Ephesus, in Asia Minor, and flourished about 500 B.C. He is said to have resigned the hereditary office of 'king' of his native city in favour of his younger brother, and to have given himself up to a life of solitary contemplation. In the old traditions he was called, from his gloomy way of looking at things, 'the weeping philosopher,' in contrast to Democritus, 'the laughing philosopher.' He died at the age of sixty. The result of Heraclitus' meditations was a work *On Nature*, of which only a few obscure fragments remain. The fundamental tenets in his philosophy are that all things are in a constant flux of becoming and perishing, that fire is the primordial principle of all existence, and that the supreme law of existence is the harmony that results necessarily from the operations of universal reason. His enigmatical fragments were published by Bywater in 1877. See *Die Philosophie des Herakleitos des Dunklen* (1858) by the famous Socialist Lassalle.

Herac'lius, a Byzantine emperor (610–41), of splendid but fitful genius, was born in Cappa-

docia about 575 A.D. In 610 he headed a revolt against the tyrant Phocas, slew him, and ascended his throne. At this time the empire was in great straits: the Avars threatened it on the north west, and the Persians invaded its frontiers from the Euxine to Egypt. The armies of Khosrau Chosroes II. captured Damascus in 613, and in the following year Jerusalem, from which they carried off the sacred cross; then Syria and Egypt were conquered, and the whole of Asia Minor to the gates of Chalcedon, over against Constantinople. At length Heraclius bestirred himself, and, having in 620 concluded a treaty with the Avars, set about disciplining an army. Two years later he took the field against his eastern enemy, and in a series of most brilliant campaigns utterly routed the generals of Persia several times in battle, won back his lost provinces, shut up Khosrau II. within the walls of his strong capital of Ctesiphon (628), and compelled him to restore the true cross, which Heraclius solemnly carried back to Jerusalem in 629. Two years later a new and more formidable enemy appeared in the south-east—viz. the followers of Mohammed, who speedily won from the Christian emperor nearly all that he had gained from the Persians, the people of Asia Minor alone opposing any resistance to their impetuous enthusiasm of conquest. Meanwhile Heraclius, strange to say, wasted his time within his palace at Constantinople in inexplicable inactivity, partly in reprehensible self-indulgence, partly in theological disputes. He died in 641, leaving the throne to his son, Constantine III. See Drapeyron, *L'Empereur Heraclius* (1869).

Herald (Old High Ger. *hariold*—i.e. *hari-wald*, 'army strength'), an officer who was in early times the messenger of war and peace between sovereigns, and of defiance and courtesy between knights, his office also including the superintendence of jousts and tournaments, and the regulation of public ceremonials. When the bearing of coat-armour came to be reduced to a system its supervision became in France, England, Scotland, and some other countries one of the functions of the herald. A herald was generally attached to every order of knighthood. Heralds had their attendants, called *pursuivants*, who were presumed to be learning the duties of a herald. Both had official titles; and often not only sovereigns, but the greater nobles, had their heralds and pursuivants. English records and chronicles of the 14th and 15th centuries contain allusions to York, Windsor, Chester, Lancaster, Arundel, Clarencieux, Leopard, and other heralds, and to Falcon, Portcullis, Antelope, and other pursuivants; and in Scottish records of the same date the heralds mentioned include Lyon, Rothesay, Marchmont, Snowdoun, Ilay, and Albany, and the pursuivants Carrick, Diligence, Unicorn. In France, England, Scotland, Burgundy, and some other countries the chief of the heralds acquired the title of *King-of-arms*, and had more or less a judicial power of regulating the bearing of coat-armour. The office of *Montjoie roi d'armes* in France is as old as the 13th century. In England in the reign of Edward III. there were two kings-of-arms—Norroy and Surroy—the jurisdiction of the one being to the north, the other to the south of the Trent. The designation Surroy was changed by Henry V. to Clarencieux. And the same king instituted a new king-of-arms called Garter, who was to be connected with the order so called, and to be principal king-of-arms of England. In Scottish records mention first occurs of Lyon King-of-arms (who took his title from the lion in the royal shield) in the beginning of the 15th century. The title of Ulster King-of-arms was created in the reign of Edward VI.; but there existed an Ireland King-of-arms at an earlier date. Certain fees were secured to the English kings-of-arms and heralds in connection with public ceremonials and creations of peers in 1408; and in 1483 Richard III. incorporated them into a collegiate body, known as the Heralds' College, or College of Arms, presided over by the Earl Marshal (whose office is hereditary in the family of the Duke of Norfolk), the other officers including Garter, principal king-of-arms, with Clarencieux and Norroy under him, besides six heralds, named Chester, Windsor, Lancaster, Richmond, York, and Somerset, and four pursuivants, Bluemantle, Portcullis, Rouge Dragon, and Rouge Croix. A residence was at first granted to the heralds, called Cold-harbour or Pulteney's Inn, in the parish of All Saints; and in 1554 Queen Mary gave them a building opposite St Bennets, which was rebuilt after the great fire of 1666, and is still the official residence of the officers of arms and depository of their archives. Heralds extraordinary are sometimes appointed by the crown, who are not members of the Heralds' College.

The College of Arms has no jurisdiction out of England. Functions similar to those which the English kings-of-arms exercise under the Earl Marshal are discharged by Lyon King-of-arms in Scotland, and Ulster King-of-arms in Ireland, directly under the crown. There are under Lyon three heralds, Rothesay, Marchmont, and Albany, and three pursuivants, Unicorn, Bute, and Albany; their duties are chiefly connected with public ceremonials and royal proclamations. Lyon's armorial functions are exercised alone, as judge in the Lyon Court, where, however, the clerk of court or his deputy is sometimes a herald.

A tabard with the royal arms embroidered on both sides of it has long been the official dress of heralds and pursuivants. The tabards of the kings-of-arms are richer in material. The insignia of the latter also include a crown, a baton or sceptre, and a chain with a medal or badge attached to it.

Heraldry is in its original and more comprehensive sense the knowledge of the whole multifarious duties of a Herald (q.v.); in the more restricted signification in which the term is used by most modern writers, and that assigned to it in the present article, it is a knowledge of the laws that regulate armorial insignia—i.e. the devices that appear on shields, with their attendant crests, supporters, and badges. After occupying for ages the attention of the learned, and forming an important branch of a princely education, this study fell for a time into neglect and disrepute, and was abandoned to coach-painters and undertakers, a degradation owing in part to the endless tissue of follies and mystifications with which it had been interwoven. Modern criticism has rescued heraldry from these pedantries and absurdities, and imparted to it a new interest as a valuable aid to historical investigations.

Instances occur in remote times of nations, tribes, and individuals distinguishing themselves by particular emblems or ensigns—e.g. the standards of the twelve tribes of Israel, of the Egyptians and Assyrians, and the Roman eagle and cohort ensigns. Figures, symbolical and ornamental, singularly like some of those of heraldry, are found mixed with other emblems in Egypt, China, India, Japan, on Etruscan vases, and on Greek coins; and shields decorated with devices are described by both Homer and Æschylus. Yet there is exhaustive negative evidence that nothing that can be properly called armorial devices were used either on shields or banners before the middle of the 12th century. The shields of the French knights in the first crusade presented a plain face of solid metal, nor is there any certain evidence of armorial bearings having been in use in the second crusade, 1147 A.D. The representation of the Norman invasion and conquest

of England on the Bayeux Tapestry (q.v.) contains on the shields of both Saxons and Normans figures of a semi-armorial character, including dragons, crosses, roundles, irregularly arranged, also striped banners; but there is no attempt to individualise the arms of the different heroes of the fight. Yet the rude devices on these shields seem to have been the precursors of systematic armory; and in the later half of the 12th century similar figures began to assume the permanent or hereditary character which is essential to the idea of armorial ensigns. Their use began with the French and Germans, and soon spread from France to England. The other nations of Europe followed; and their nearly simultaneous adoption seems to have been in part the result of the intimate intercourse which the crusades brought about between the chief sovereigns and warriors of Europe. Tournaments helped to bring arms into fashion, and before long the bearing of hereditary arms on shields and banners became one of the most prominent features of medieval life. Some sort of armorial insignia were certainly depicted on the shields borne in the third crusade, which took place in 1189; and in the same century originated the fleurs-de-lis of France, and the lions or leopards of England. In the 13th century the practice was introduced of embroidering the family insignia on the surcoat worn over the hauberk or coat of mail, whence originated the expression *coat-of-arms*. Arms were similarly embroidered on the jupon, cyclas, and tabard, which succeeded the surcoat, and also enamelled or otherwise represented on furniture, personal ornaments, and weapons. Sealing had, before the introduction of heraldry, become a legal formality necessary to the authentication of a deed, and from the 13th century onwards the seals of all persons of noble or gentle birth represented their armorial ensigns (see SEAL). Those seals, appended to charters, are among the most valuable materials for tracing the history of heraldry, though they labour under the disadvantage of not indicating colours, as the arms on painted windows do.

Among important adminicles for the study of English heraldry are certain extant rolls or records of arms of the times of Henry III., Edward I., Edward II., Edward III., and also of later reigns, in the British Museum, Heralds' College, and elsewhere—a good many of which have been published or privately printed. The earliest of these, of date 1240 to 1245, show that heraldry had at that date been reduced to a systematic shape. In most cases the arms on these rolls are verbally described; in a few instances they are drawn. Along with the rolls of arms may be classed a heraldic poem known as the *Roll of Caerlaverock*, in which are recited in Norman-French the names and arms of the knights-banneret who were present at the siege of that fortress in 1300. It was edited by Sir Harris Nicolas (1828), and by Thomas Wright (1861). Only a little later in date is a manuscript armorial of all Christendom, the work of a Flemish herald of the middle of the 14th century, preserved in the Royal Library at Brussels, in which the shields are beautifully illumined in colours, with, in many cases, the addition of helmets and crests; it has been reproduced in fac-simile by M. Bouton. A valuable Swiss roll of the same century has been fac-similed in the same way by the Antiquarische Gesellschaft of Zurich. Authentic materials of this kind enable us to trace the steps by which the usage of arms reached the still more systematised form which it assumes in the works of the established writers on heraldry. In the hands of these authors, the earliest of whom wrote at the end of the 14th century, the historical part of the subject had been obscured by a tissue of fictions, which had a very misleading effect down to a quite recent time. The arms assigned to our forefathers Adam and Noah, to the old Jewish and pagan worthies, and to the Apostles, have long ceased to be believed in; but till a very recent date the coats of Edward the Confessor and of William the Conqueror were regarded as thoroughly historical. No less spurious than the arms of Edward the Confessor are those given by George Rüxner, herald to the Emperor Maximilian I., in his *Thurnierbuch* to knights of Germany of the 10th century, and his *Leges hastiludiales* of Henry the Fowler, who flourished two hundred years before the earliest germs of heraldry, one of which laws made it imperative for the combatants in tournaments to have borne 'insignia gentilitia' for four generations. These laws of Henry the Fowler have imposed not only on the German armorialists of last century, but on Mr Ellis, who in his ingenious plea for the antiquity of heraldry, appeals to them with full faith in their genuineness. Modern German critics, however, reject them as a palpable forgery.

In the infancy of heraldry every knight seems to have assumed what arms he pleased. Animals, plants, imaginary monsters, things artificial, and objects familiar to pilgrims and Crusaders, were all fixed on; and whenever it was possible, the object chosen was one whose name bore sufficient resemblance in sound to suggest the name or title of the bearer of it. The charge fixed on was used with great latitude, singly or repeated, in any way which the bearer of the shield chose, or which the form of his shield suggested. But as coats-of-arms multiplied, different knights occasionally fixed on the same symbol, and the confusion which arose from the similarity of coats-of-arms could only be obviated by a restraint being placed on the bearer's fancy, and regulations being introduced regarding the number, position, and colour of the charges, and the attitudes of the animals represented. As heraldry became more and more consolidated into a system, the true origin was lost sight of, and the fertile imagination of the early armorialists led them to invest the most common charges with mystical meanings, and to trace their original adoption to the desire of commemorating the adventures or achievements of the founders of families. The legends ascribing an origin of this kind to early armorial bearings have, wherever it has been possible to investigate them, proved fabrications. For the first few centuries of the existence of heraldry a very large number of the insignia, both of families and of kingdoms, were, as already remarked, *armes parlantes*, though the allusion can now in many cases be traced with difficulty. The lion of Leon and Louvain, the castle of Castile, the bear of Berne, the column of the Colonna family, are well-known continental examples; and in England we have three fountains for Wells, a whirlpool (gurges) for Gorges, a calf for Vele. At the same time commemorative heraldry, which became common in later times, was not absolutely unknown in the 14th century, one of the earliest instances being the heart introduced into the Douglas coat, in memory of the pilgrimage of the good Sir James with the heart of his royal master, found on the seals of the Douglas family as early as 1356.

As no two families in the same kingdom were allowed to bear the same arms, the right to bear a particular coat sometimes became a matter of fierce dispute. It lay in England with the constable and marshal, as judges in the Court of Chivalry, to decide questions of this kind, with a right of appeal to the king; and one of the most famous contests before them was that between the families of Scrope and Grosvenor, in 1385, for the right to bear the coat azure, a bend or; when John of Gaunt was one of the witnesses examined, and the undifferenced coat was adjudged to Scrope.

In course of time the right to use a coat-of-arms became, like the *jus imaginum*, the distinctive privilege of the noble, the word being used here in the continental sense, analogous to the English Gentleman (q.v.); and the privilege transmitted to all his descendants in the male line. When a prince made a plebeian noble, as it was competent for him to do, the patent of nobility defined what arms he was to bear.

In England a proclamation of Henry V. restrained the private assumption of armorial insignia, by prohibiting all who had not borne arms at Agincourt to assume them, except in virtue of inheritance or a grant from the crown. On the establishment of the Heralds' College (see HERALD) in 1483, the regulation of matters armorial was to a large extent delegated to the kings-of-arms and heralds acting under the Earl Marshal. Periodical visitations of the different counties were directed to be made to take cognisance of the arms, pedigrees, and marriages of the nobility and gentry of England. These visitations went on at varying periods from 1528 down to 1704, and are the principal source of evidence as to the hereditary right to bear arms in England. Among the functions exercised by the English kings-of-arms (the chief of whom is Garter King-of-arms) are the assigning of appropriate insignia to persons who have acquired a social importance that entitles them to take their place among the gentlemen of coat-armour of the country. Lyon King-of-arms, besides being a judicial officer having cognisance of all questions regarding the right to arms, exercises by direct delegation from the crown similar functions in the case of Scotsmen in the way of granting arms to *novi homines*; as does Ulster King of arms in the case of Irishmen. The wrongful assumption of arms is still in Scotland, if not in England, an act for which statutory penalties can be enforced against the assumer.

While there is nowhere on the Continent an institution similar to the English Heralds' College, there still exists in Prussia, Austria, Bavaria, Russia, Holland, and Belgium, and some other continental countries, a direct supervision of armorial insignia, which takes place through the chancery of the orders of the kingdom. In Sweden and Norway the abolition of titles of nobility has made the administration of armorial matters more lax, though the preservation of the orders of knighthood implies a chancery or office of regulation so far as they are concerned. In France there is now no *juge d'armes*; and spurious heraldry figures largely on carriages and elsewhere in Paris. In the United States the stars and stripes are said (erroneously, it would appear; see FLAG, Vol. IV. p. 665) to be derived from the arms of Washington; and it is not unusual for individuals and families to trace their descent from old-world houses, and to assume the arms proper to their name. So in the British colonies.

Not only families, but kingdoms, feudal lordships, towns, episcopal sees, abbeys, kings-of-arms in their official capacity, and corporations may by heraldic usage bear arms. The arms of two or more states ruled by one sovereign prince are marshalled together quarterly or otherwise in one escutcheon; and it has been the practice of many sovereigns to marshal along with their own arms of dominion, arms of territories of which they are not in possession, but to which they claim a right. Thus, England bore the arms of France from the time of Edward III. till 1801; and the kings of Naples and of Sardinia were in use to bear the arms of Cyprus and of Jerusalem. Similarly it has been the practice of the Dukes of Athole and Earls of Derby, as having been lords of Man, to quarter the arms of that island; and feudal coats are borne quarterly and *en surtout* by various peers of Scotland. As to honourable additions to arms granted by sovereigns, see AUGMENTATION.

While family arms transmit in the male line to the descendants of the bearer of them, to be borne by cadets with recognised differences, an heiress in the heraldic sense—i.e. a daughter who represents her father, conveys her arms to her husband (provided he be himself a gentleman of coat-armour) to be marshalled in accordance with certain rules with his own. Occasionally the arms of a great heiress are allowed altogether to supersede the paternal coat; and sometimes a successor who is a stranger in blood has been empowered to assume adoptive arms to fulfil the wish of a testator.

Heraldry is thus, in one of its aspects, a faithful chronicler of the history both of royal dynasties and of private families. Every change in the hereditary succession of a kingdom, every union of two houses by marriage, occasions a corresponding change in the coat-of-arms; the position which the members of a house occupy in the family tree is duly indicated, and an armorial shield is thus a record whose nice distinctions indicate to all who understand its language, a number of material facts regarding the owner of it. Heraldry is in this way an aid to the study of history, general and local. It has often afforded the key to questions of disputed succession; and seals, baronial and monumental carvings, and shields in church windows, have all been recorded in courts of law as evidence in obscure questions of marriage and descent.

The Shield.—A coat-of-arms is composed of charges depicted on an escutcheon representing the old knightly shield. The word 'escutcheon' is derived from the French *écusson*, which signified a shield with arms on it, in contradistinction from a shield generally. The forms of the shield represented in heraldry, as in war, differed at different times. The actual shields of the 11th and 12th centuries were in shape not unlike a boy's kite.

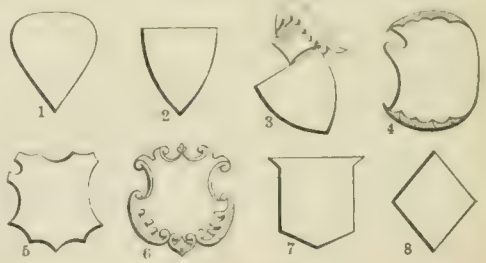


Fig. I.—Shields.

They were curved to encircle the body, and in some early seals are so represented; but, after heraldry began to be systematised, we generally find them engraved on seals and monuments as if flattened, to let the armorial design be fully seen. The pear-shape (1, fig. I.) represented in a few early shields, was soon followed by the flat-iron or heater-shape (2), which prevailed in the 12th and 13th centuries, with an increasing tendency to bulge towards the base, more especially after the introduction of the practice of quartering. When helmet, or helmet and crest, were represented, the shield was often placed in the position called *couché* (3), as if suspended from the helmet by the sinister chief angle. Towards the end of the 15th century appeared such forms as 4 and 5, where the notch is meant to represent a rest for the knightly lance. In the 16th century the forms used became more florid (6), but with considerable variety. The forms in use in the 17th and still more the 18th century, became

gradually more and more tasteless and unmeaning, the least offensive being perhaps the vair-shaped shield (7). In France and Germany the shield most in use is very wide at the base, so as to afford sufficient room for the display of quarterings or small charges. In Spain the favourite type of shield has always been one with rectangular sides and a segment of a circle for the base. The shield of an unmarried lady or widow is of a lozenge-shape (8).

To facilitate the description, or as it is called blazoning of arms, the different points or positions on the escutcheon have received technical names. English heralds generally enumerate them as nine: A (fig. II.), the dexter chief point; B, the middle chief; C, the sinister chief; D, the honour or collar point; E, the fess point; F, the nombril or navel point; G, the dexter base; H, the middle base; and I, the sinister base point. To these may be added K, the dexter flank, and L, the sinister flank. It will be observed that the dexter and sinister sides of the shield are so called from their position in relation to the supposed bearer of the shield, not of the spectator.

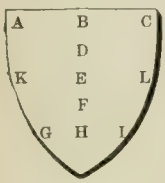

Fig. II.

Tinctures.—Coats-of-arms are distinguished from each other not only by the charges or objects borne on them, but by the colour of these charges, and of the field itself. The field may be of one colour, or of more than one, divided in various ways to be noticed below. *Tincture* is the more proper armorial expression than colour, as the surface of a shield or of an armorial figure may be of a metal, or a fur, as well as of a colour strictly so called.

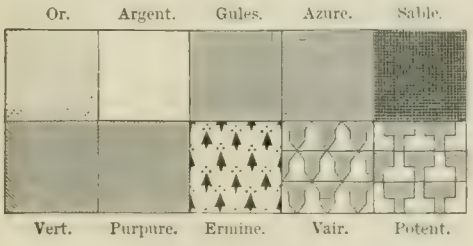

Fig. III.—Tinctures.

The nomenclature of these three classes of tinctures, as of heraldry generally, is an adaptation of Norman-French. The metals in use are two—gold, termed *or*, and silver, *argent*, often represented in painting by yellow and white. The colours are five—red, blue, black, green, and purple, known as *gules*, *azure*, *sable*, *vert*, and *purpure*. A charge represented not of any of these conventional heraldic tinctures, but of its natural colour, is said to be *proper*. In uncoloured heraldic engravings, it has been found convenient to have a mode of representing colours and metals by hatched lines and dots, which is shown in fig. III.; an invention not older than the 17th century. *Or* is represented by dots; for *argent*, the field is left plain; *gules* is denoted by perpendicular, and *azure*, by horizontal lines; *sable*, by lines perpendicular and horizontal crossing each other; *vert*, by diagonal lines from dexter chief to sinister base; and *purpure*, by diagonal lines from sinister chief to dexter base. The original furs in use were *ermine* and *vair*. The former is represented by black spots resembling those of the fur of the animal called the ermine, on a white ground. *Vair*, said to have been taken from the fur of a squirrel, bluish-gray on the back, and white on the belly, is expressed (at least in the more modern heraldry) by blue and white bells or panes in horizontal rows, as shown in the figure. As the number of coats increased, various modifications of these furs were introduced, including *ermines*, or ermine with the field black and the spots white; *erminois*, with the field gold and the spots black; *erminites*, with a red hair on each side of the black spots; *pean*, with the field black and the spots gold. *Potent* is a crutch-shaped form of vair, as represented in the figure, and it also has occasional varieties which need not be noted at length. When vair is composed of any other tinctures than argent and azure, it is blazoned *verry* of these tinctures, and is more strictly a field divided by partition-lines than a fur.

Charges.—Everything depicted on the field of the escutcheon is called a *charge*, and is supposed to stand out in relief on it; and as a general rule, a shield-of-arms has one or more charges. A few exceptional cases occur in continental heraldry of an uncharged shield of one of the metals, colours, or furs; and even in British heraldry there are, as will be seen, cases where a field consisting of metal and colour divided by partition-lines is uncharged. It is an established rule of heraldry that metal should not be placed on metal, nor colour on colour. A remarkable transgression of it occurs in the arms of the kingdom of Jerusalem founded by the Crusaders, which are argent, a cross potent between four crosses or. A recognised exception exists wherever a charge lies over a field partly of metal and partly of colour, or where an animal is (see *infra*) armed, langued, attired, unguled, beaked, membered, crowned, collared, or chained of a different tincture from that of his body. One charge of colour may surmount—i.e. partly cover, another of colour on a field of metal, and the same may happen in case of two charges of metal on a field of colour.

Armorial charges are usually divided into three classes: (1) Honourable ordinaries, figures of simple outline and geometrical form, conventional in character, which in some of the oldest coats are the only charge; (2) Subordinaries or subordinate ordinaries, which differ from the above chiefly in not being generally the recipients of charges, while honourable ordinaries may be and often are charged; (3) Common charges, representations of objects of all kinds, animals, plants, and the whole range of things natural and artificial.

Ordinaries.—The enumeration of the honourable ordinaries by different armorialists is not absolutely identical, some classing as subordinaries figures which others regard as belonging to this class. It may be predicated generally of the ordinaries that they may be borne either simply, along with other charges, charged with other figures, bounded by any of the forms of irregular partition-lines to be noticed below, or combined with each other. Also that they have in most cases their diminutives, which (except in the case of a canton as the diminutive of a quarter) cannot be charged. Taking as our test for admission to this more honourable class the capacity of receiving charges, they may be accounted thirteen in number:

The *Chief* (1, fig. IV.), lying horizontally along the upper part of the shield, and (as also the Pale and Fess) supposed to occupy a third of it. The *Pale* (2), a vertical band in the middle of a shield. It has a diminutive, the *Pallet*, seldom used singly, and a smaller diminutive, the *Endorse*. The *Fess* (3), a horizontal band in the middle of the shield. The *Bar* is a narrower fess, never used singly, and there are further diminutives, the *Closet* and *Barrulet*. The *Bend* (q.v.) (4), a band crossing the shield from dexter chief to sinister base; when charged it occupies one-third, and when plain one-fifth, of the field. It has for diminutives the

Bendlet, the *Cotise* or *Cost*, and the *Ribbon*. The ribbon is sometimes *couped* or cut short so as not to touch the edges of the shield. The cotise sometimes accompanies the bend in pairs on each side, when it is said to be *Cotised*, and the same term is sometimes applied with less propriety to a fess or chevron accompanied by a pair of its diminutives. The *Bend sinister* (5), a band crossing the shield from sinister chief to dexter base. Its diminutive, the *Baton sinister* (q.v.), couped, and borne over all is a mark of illegitimacy. The *Chevron* (6), a figure composed of two bands or limbs issuing from dexter and sinister base, and meeting about the honour point. Its diminutives are the *Chevronel*, which never appears singly, and the *Couple-close*, which sometimes accompanies the chevron in pairs, one on each side. The *Cross* (7), of the form of the Greek cross, with equal limbs.

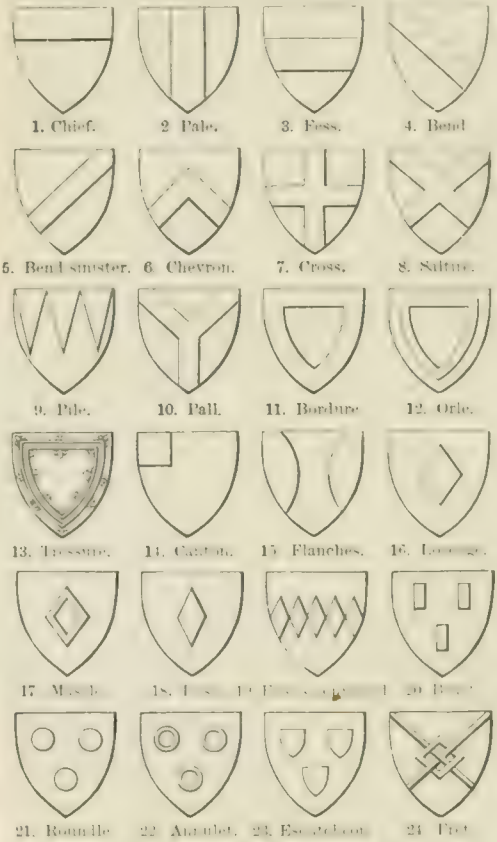

Fig. IV.—Ordinaries and Subordinaries.

It has numerous varieties, most frequently borne in numbers or with other charges, for which see Cross. Any of them is said to be fitchée when its lower limb terminates in a sharp point. The *Saltire* (8), a St Andrew's Cross, or combination of the bends dexter and sinister, often borne along with a chief in the heraldry of Scotland. The *Pile* (9), a triangular wedge-shaped figure, issuing usually from the chief with point downwards. Three piles are often borne together. The *Pall* (10), the upper part of a saltire combined with the lower part of a pale. A variety of it, couped and pointed at the extremities, occurs in Scotland under the name of a *Shakefork*. The *Bordure* (11), a border surrounding the shield, sometimes used as a principal figure, sometimes as a difference. The *Orle* (12) and the *Tressure* (13) are sometimes classed as its diminutives. The former is a narrower bordure detached from the edge of the shield. The latter, borne double and flowered and counterflowered with fleurs-de-lis, occurs in the royal shield of Scotland, and is a bearing greatly esteemed in Scottish heraldry. The *Quarter* is the upper dexter fourth part of the shield, cut off by a vertical and a horizontal line meeting in the fess point. The *Canton* (14), of more frequent occurrence, is a smaller figure like it, and also in dexter chief, unless otherwise specified. The half of a canton parted per bend is called a *Gyron*, chiefly known in British heraldry as giving its name to the field *Gyronny*. *Flanches* (15), borne in pairs, are projections from each flank of the shield bounded by a segment of a circle. Their diminutives are *Flasques* and *Voiders*.

Subordinaries. The subordinaries (excluding those here included in the category of honourable ordinaries) are: The *Lozenge* (16), a rhombus with the acute angles at top and bottom. The *Mascle* (17), a lozenge deprived of the middle part. The *Fusil* (18), an elongated lozenge. Several fusils are sometimes *conjoined en fess* (19), as in the coat of Percy. The *Billet* (20), an oblong figure placed perpendicularly. The *Roundle* (21), a circular disc or knob. Roundles have, in English heraldry, specific names in respect of their tinctures. A roundle or is called a *Bezant*; argent, a *Plate*; gules, a *Torteau*; sable, a *Pellet* or *Ogress*; vert, a *Pomme*. The *Annulet* (22), sometimes regarded by armorialists not as a ring but as a pierced roundle. The *Escutcheon* or *Inescutcheon* (23), a representation of a shield the latter name being generally used when there is only one. It is difficult to see on what principle these last two charges are conventional enough to be ranked among the lesser ordinaries. The *Fret* (24), consisting of two narrow bendlets dexter and sinister in saltire, interlaced with a mascle.

Parted Fields.—The field of an escutcheon (and sometimes an ordinary or other charge) may be of two or more different tinctures, divided by

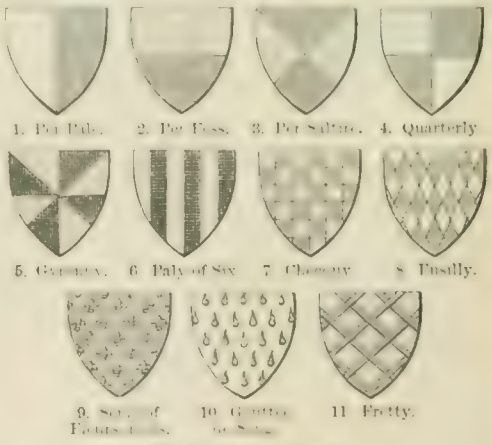

Fig. V. Parted Fields.

one or more partition-lines, and the consideration of partition-lines has here been postponed to this point, as the nomenclature of many of them is derived from that of the ordinaries and subordinaries. When divided by a partition-line in the direction of one of the ordinaries the shield is said to be '*parted* (or *party*) *per* that ordinary,' or simply '*per* that ordinary.' Thus we may have a shield parted per *pale* (1, fig. V.), *fess* (2), *bend*, *chevron*, or *saltire* (3). A shield divided in the direction of a cross is said to be quartered or parted

quarterly (4); parted both per cross and per saltire it is called *Gyronny of eight* (5), the well known bearing of the Campbell family. A shield divided into any number of parts by lines in the direction of a pale, bend, bar, or chevron, is said to be *Paly*, *Bendy*, *Barry*, or *Chevronny*, the number of pieces being specified, as in the example (6), paly of six or and sable (Athole). A field divided into square or oblong panes or pieces by vertical and horizontal lines is said to be *checquy*, as the ancient coat of Warren, checquy or and azure panes (7). A field divided into lozenge-shaped, mascle-shaped, or fusil-shaped panes is described by the term *lozengy*, *mascally*, or *fusilly*. Fusilly argent and gules (8) is the coat of the Grimaldis, princes of Monaco.

A field strewed with an indefinite number of small charges so as to produce the effect of a pattern is said to be *semé* (sometimes aspersed or powdered) of that charge, as France ancient, azure, semé of fleurs-de-lis or (9). When bestrewed with an indefinite number of bezants, billets, cross crosslets, or drops, it is called *bezanty*, *billetty*, *crusilly*, or *gouttée*. English heraldry attaching a specific term to drops of separate tinctures—i.e. gouttée d'eau (water, tinctured argent), de sang (blood, gules, 10), de larmes (tears, azure), de poix (pitch, sable), &c. *Fretty* (11) is when a field is covered with a pattern of interlaced fillets placed diagonally, and leaving open spaces between them.

Partition-lines are not always straight. Fig. VI. represents the commonest forms of irregular partition-lines in use—viz. the *engrailed*, *invected*, *wavy*, *nebulé*, *embattled*, *indented*, and *dancetté*, names equally applicable to the boundary-lines of ordinaries. An ordinary engrailed has the points of the engrailed line turned outwards, and an ordinary invecked inwards. When a fess or chevron is said to be embattled, it is only the boundary-line on the upper side that is of this form. Dancetté differs from indented by the partition-line having larger and fewer indentations.

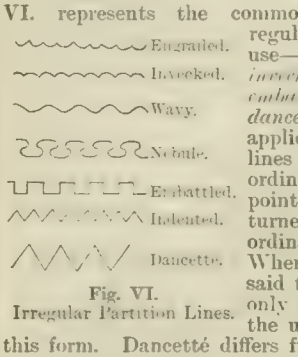

Fig. VI.
Irregular Partition Lines.

Common Charges.—These are representations, more or less conventional, of familiar objects. The knights, in the early days of heraldry, ransacked the animal and vegetable kingdom and the whole range of objects, natural and artificial, for charges that would be distinctive; of which only a few of the most frequent, and those whose nomenclature or treatment is somewhat technical, can be here noticed.

Of beasts which occur in coat-armour, the most important, both in earlier and in later heraldry, is the *Lion*. Its earliest known occurrence is on the seal of Philip I., Duke of Flanders, in 1164; and before long the king of beasts was borne by a large number of the potentates of Europe. The lion is made to assume a variety of positions, a few of which are represented in fig. VII. Its original and normal attitude is *rampant* (1)—i.e. in an erect position with the left hind-leg resting on the ground, the head in profile, and the tail elevated over the back. *Rampant gardant* (2), the same with the head affrontée (looking out of the shield); *regardant* (3), the same looking backwards. *Passant* (4), walking, three paws resting on the ground, the dexter forepaw elevated, the head in profile looking forward, and tail elevated over the back; *passant gardant* (5), as the last, but with the head affrontée. A lion *salient* (6) has both hind-legs on the ground, and the fore-legs elevated, as if to spring; and a lion *sejant* (7) is rising to prepare for action. The lion passant gardant is often blazoned as the lion of England; and in times when terms of blazonry were comparatively few, it was known as the *leopard*; there has, in fact, been much controversy as to whether the animals in the escutcheon of England are lions or leopards. Two-headed, bicorporate, and tri-corporate lions occur in heraldry, as also lion-dragons and lion-poissons. There is likewise the celebrated winged lion of St Mark adopted by the republic of Venice, and the two-tailed lion of Bohemia and of Simon de Montfort, Earl of Leicester. In British heraldry lions and other animals always face to dexter unless otherwise blazoned. Two lions placed face to face are called *combatant*, and back to back, *addossé*. Some of the above-mentioned names for the attitudes of the lion are applied to other heraldic animals. Lions and other beasts of prey are said to be *armed* or *langued* of any tincture, when their teeth and claws or their tongue are of that tincture, and in modern English blazon a lion is always presumed to be armed and langued gules unless either himself or the field be gules, in either of which cases he is armed and langued azure. A *demi-lion* (8) is the upper half of the body of a lion with the extremity of his tufted tail. Lions are often crowned, or gorged (collared) with a crown of some sort. Bears, bulls, boars, stags, goats, dogs, foxes, horses, and hedgehogs, and occasionally elephants, camels, moles, apes, bats, and mice occur as heraldic animals. A *stag* when in easy motion is said to be *trippant* (9); he is *at gaze* (10) when a lion would be statant gardant, and he is attired of any tincture when his attires—i.e. his antlers, are of that tincture. Animals that possess horns and hoofs are said to be armed and unguled in respect of them. The heads and limbs of animals are often borne as charges, and may be either *erased*, like the lion's head (11)—i.e. cut off with a jagged edge; or *couped* (12)—i.e. cut straight off. A *leopard's face* (13) shows none of the neck, and fronts the spectator. A *stag's head* borne full faced, with none of the neck seen, is said to be *cabossed* (14). *Boars' heads* (15) are not unfrequent, and *bears' heads* (16), which are usually represented muzzled. Animals in heraldry sometimes assume a conventional form differing widely from the realistic type of the same creature—e.g. the antelope, which has a stag's head, a unicorn's tail, a tusk issuing from the tip of the nose, a row of tufts down the back of the neck, and similar tufts on the tail, chest, and thighs.

Among birds, far the most prominent is the *Eagle* (q.v.), most commonly represented in the conventional attitude known as *displayed* (17), with wings expanded. Being the king of birds, it became, next to the lion, the most favourite bearing of royal personages, and was adopted by the German emperors. The imperial eagle had at first but one head; the *two-headed eagle* (18) appeared in the middle of the 13th century, and occasionally occurs in English heraldry. The allerion and martlet, originally an eagle and a swallow respectively, became in time unreal birds, the one without claws or beak, the other without legs or beak. The falcon, the pelican, the swan, the cock, the raven, the ostrich, the heron, and the parrot or papingoe are all armorial birds. The *pelican* is generally depicted pecking her breast, and when represented in her nest feeding her young with her blood, she is said to be *in her piety* (19). A peacock borne affrontée with his tail expanded is said to be *in his pride*. Birds having the power of flight are, in respect of their attitude, *close*, *rising*, or *volant*.

Fishes and reptiles occur as charges; the former are said to be *naiant*, if drawn in a horizontal, and *hauriant* (20), if drawn in a vertical position.

The *dolphin*, whom naturalists do not acknowledge as a fish, is in heraldry the king of fish, and is very conventionally drawn most usually *embowed* (21)—i.e. with the body bent. It is best known in this attitude as the allusive bearing of the dauphin. The *escallop shell* (22) is a favourite charge, having been the pilgrim's ensign in crusading times. *Serpents* occur in various attitudes, bowed, erect, &c., and in one famous instance (the coat of the Visconti) *vorant* (devouring) a child (23).

Of purely fantastic animals, we have the dragon, griffin, wyvern, cockatrice, unicorn, mermaid, and others.

Man in whole and in his parts also occurs in armory. Argent, a naked man proper, is the coat of the Scottish family of Dalzell, and we have Moors' (generally represented as blackamoors) heads, Saracens' heads, men's hearts, arms, legs, and hands, also that strange heraldic freak, the *three legs conjoined* (24), carried in the escutcheon of the Isle of Man.

To pass to the vegetable kingdom, trees, plants, leaves, and flowers are all usual heraldic charges. *Trees* are often *eradicated* (25), or torn up by the roots, sometimes placed *on a mount* (26), and occasionally *fructrated* of a different tincture. *Garbs* (27), representing sheaves of wheat, are well known

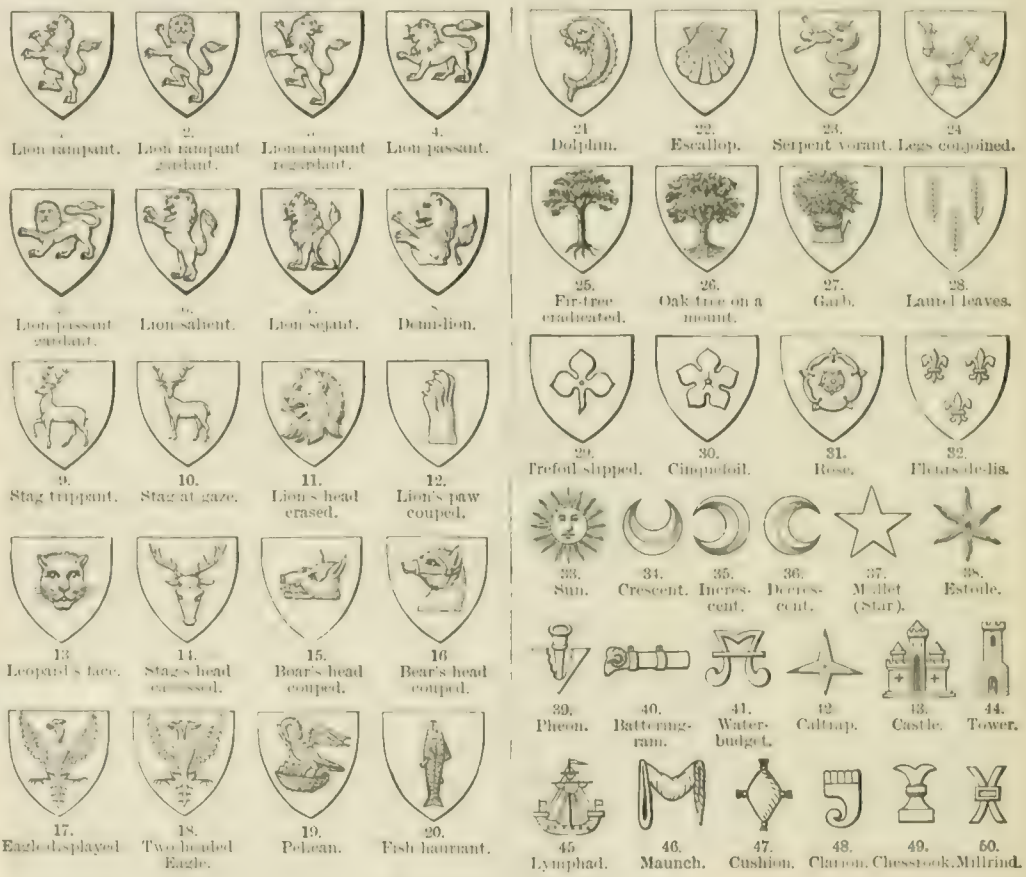

Fig. VII.—Common Charges.

as the arms of the Earls of Chester, of the Grosvenors, and of the Scottish family of Cumyn. *Leaves*, as of the *laurel*, are often borne, like many other charges, in threes (28). A *trefoil*, with three leaflets and a stalk, is said to be *slipped* (29); in the *quatrefoil* and *cinquefoil* (30) the syllable foil means a petal. The *rose* (31) has obtained a prominence in English heraldry from having been the badge of the rival houses of York and Lancaster, and in the conventional representations of it, it has five petals, barbs between them to represent the calyx, and seeds in the centre. It is generally without a stalk, its tincture being either gules or argent, and it is usually barbed and seeded proper —i.e. the barbs are green, and stamina yellow or gold. But of the floral devices of heraldry the most famous is the *fleur-de-lis*, generally identified with the iris, adopted as a badge by Louis VII. of France in 1150, and borne by his son in the form of semé of fleurs-de-lis (9, fig. V.), which became the royal coat of France, till the flowers were reduced to three in number in the reign of Charles VI. (32).

Such charges as swords, scimitars, bows, arrows, helmets, battle-axes, horseshoes, mitres, crosiers, &c. explain themselves. The *sun* surrounded by rays is said to be in his splendour, and generally has a human face (33). A *crescent* (34), representing the moon, has both horns pointed upwards. If the horns are turned to dexter it is called an *increscent* (35); if to the sinister a *decrescent* (36). The *five-pointed star* (37), in the heraldry both of the Continent and of Scotland, represents the heavenly body so called, though not distinguishable from the *mullet* or spur-rowel, except that the latter is sometimes pierced. In modern English heraldry this figure is always styled a mullet, and the *estoile* (38) or star has six or more wavy points. A *pheon* (39) is the head of a dart

barbed and engrailed on the inner side. A *battering-ram* (40) is furnished with an actual ram's head. A *water-budget* (41) represents the bags in which water was stored up and carried across the desert in crusading times. *Caltraps* (see CALTROP) or *chevaltraps* (42) are military instruments for galling the feet of horses. *Castles* (43) and *towers* (44) are not unfrequent, the former very generally triple-towered. An ancient one-masted galley, called a *lymphad* (45), is characteristic of the West Highlands of Scotland. Of charges derived from dress one of the most remarkable is the *maunch* (46), a 12th-century sleeve, borne by the Hastings family. *Cushions* (47) have become famous in Scotland from being borne by Bruce's gallant nephew, Randolph or Ranulph, Earl of Moray, and his descendants. The *clarion* (48) or war-trump is an early English bearing. The *chessrook* (49) or castle in chess is somewhat conventionally drawn. The *millrind* (50) is the iron affixed to the centre of the millstone.

Like medieval architecture, heraldry attained its greatest beauty and purity in the 13th century and first half of the 14th. From that date its early simplicity was gradually departed from: a variety of charges came to be accumulated in one shield, and there was a growing tendency to pictorialism. Trees are represented issuing out of a mount or little green hillock in base (26), and we have also animals walking on a base—i.e. a line cutting off the lower part of the shield. In Wales we have combinations such as a cradle with a child under a tree guarded by a goat, and sometimes in Spain and Italy two animals rampant against a tree, or such scenes as a bloodhound in the act of strangling a boar, or a *serpent vorant* a child (23). In the second half of the 18th century the heraldry of England entered on a singularly degraded and debased stage, far beyond the pictorialisms alluded to, shields being loaded with representations of sea-fights, fortresses, and landscapes, with medals and decorations granted to the bearer of them, setting all heraldic conventionalities at defiance, and dealing in details hardly discernible on the closest inspection. Such charges were habitually granted by way of chiefs of augmentation to the heroes of the old wars. It is to be hoped that the revival of a measure of taste in coat-armour has put an end to them for ever.

Blazonry.—To blazon a coat-of-arms is to describe it in words so precise as to enable any one who has an ordinary knowledge of heraldry to depict it correctly. The following are the principal rules of blazonry. The field must first be named; it may be of one tincture, or an arrangement of more than one (see *ante—Parted Fields*). The charges follow, beginning with those of most importance and nearest the field, their name, number, position, and tincture. An ordinary or a diminutive of an ordinary, except it be a chief, bordure, or canton, generally claims the precedence. When the principal charge is not in the centre of the shield, its position must be described, as De Vere, Earl of Oxford (fig. VIII. 1), quarterly gules and or, in the first quarter a star (mullet) argent. When two or three of the same charge occur, it is understood, unless otherwise specified, that two are placed in pale—i.e. one over the other; and three are disposed, two above and one below; and it is also understood that in case of a fess or a bend between six charges of the same kind, there are three in chief and three in base. In other cases the disposition of the charges must be specified, as *in bend*, *in cross*, *in saltire*, *in orle*: *three*, *two*, and *one*; *four*, *three*, *two*, and *one*, &c. If the ordinary, which is the principal charge, be itself charged, and there are also other charges in the field, the order of the words of blazon will be understood by the following example—Wilmot, Earl of Rochester (2), argent, on a fess gules, between three eagles' heads erased sable, as many escallops or. An exception to the rule that an ordinary or its diminutive is first named, occurs where it debruises or surmounts another charge—e.g. Abernethy (3), or, a lion rampant gules, surmounted by a ribbon

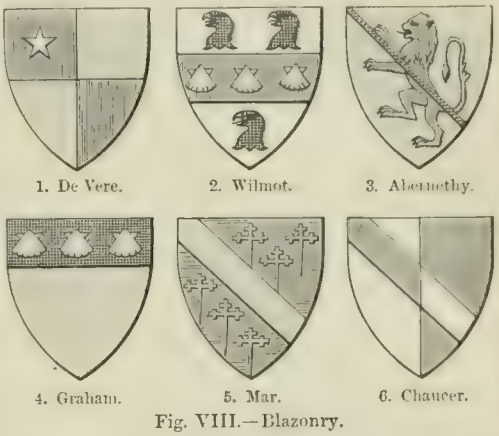

Fig. VIII.—Blazonry.

sable. Generally speaking, a chief, bordure, or canton is mentioned last. When a bordure surrounds a chief, the bordure is named last of all, the reverse being the case when the chief covers the bordure. A bend may surmount a chief, in which case it is mentioned last.

Avoidance of repetition is one of the principles of blazonry. When any tincture has to be repeated, it is on the second occasion described as *of the first*, *of the second*, *of the last*, or *of the field*—e.g. Graham (4), or, on a chief sable, three escallops of the field. Repetition may also be avoided by naming the tincture only the second time—e.g. Mar (5), azure, a bend between six crosslets fitchée or, where the tincture *or* applies to both bend and crosslets.

When the field is of a metal and colour separated by any of the lines of partition, and the charge on it is said to be *counterchanged*, this means that the part of the charge which is on the metal is of the colour, and *vice versâ*, as in the coat borne by the poet Chaucer (6), per pale, argent and gules, a bend counterchanged.

Differencing.—With the advance of the science of arms it became necessary not only to distinguish different families, but to distinguish the different members and branches of a family from each other and from their chief. The head of the house had alone the right to use the pure paternal coat; the cadets had to wear it with a *brisure* or *difference*. There is great variety in the early brisures. A change of tincture, the substitution of one ordinary for another, the debruising of the paternal coat by a bend, the surrounding the arms with a bordure, uncharged or charged, and the addition of part of the coat of an heiress, were all in use as modes of differencing. The differenced coat became an independent heraldic composition, sufficiently like the original arms to indicate the family to which its owner belonged, and also often suggestive of events in the history of the cadet line.

The name of *marks of cadency* has been given to certain small figures which, by a conventional arrangement, indicate the order of descent of the different sons of a family. As systematised about the reign of Henry VII., and in use in modern English heraldry, the marks of cadency are, the *label* (1, fig. IX.) for the eldest son, the *crescent* (2) for the second, the *mullet* (3) for the

third, the *martlet* (4) for the fourth, the *annulet* (5) for the fifth, the *fleur-de-lis* (6) for the sixth, the *rose* for the seventh, the *cross moline* for the eighth, and the *octofoil* for the ninth. The difficulties are obvious of carrying out a system of this kind through all the ramifications of a family for successive generations, even by such devices as charging a crescent with a mullet for the third son of a second son, &c., and the consequence of the supersession in England of all other differences by these figures has been that differencing is much neglected, and remote cadets are often found bearing the arms of the head of their house undifferenced. With the sons and daughters of the royal house of the United Kingdom another usage prevails. They all bear their arms differenced by a label of three points argent. That of the Prince of Wales is plain, those of the younger princes are variously charged.

1. Label. 2. Crescent. 3. Mullet. 4. Martlet. 5. Annulet. 6. Fleur-de-lis.

Fig. IX. Marks of Cadency.

The label of the Duke of Edinburgh is charged with a St George's cross in the centre point, and in each of the other points with an anchor azure. The Duke of Connaught substitutes for the anchor a fleur-de-lis azure, and the Duke of Cambridge two hearts in pale gules.

In Scotland, owing perhaps to the wider ramification of the principal feudal families, differencing has been considered of more moment, and is the subject of a separate treatise by the Scottish herald Nisbet. The modern marks of cadency are less in use. The modification of the paternal coat by an additional charge, the engrailing, invecking, &c., of a chief or a partition-line has never fallen out of use. Differencing by a bordure has also been much in favour, a plain bordure of the tincture of the principal charge in the case of a second son, which may be engrailed, invecked, wavy, &c., for cadets branching off in the same generation, and for sub-cadets, parted in different ways, or charged with figures from the maternal coat. With cadets of a later generation the bordures will be of a different colour. Some such system, more or less rigidly observed, runs through the differencing of Scottish coats, which is under the direct supervision of the Lyon Office. For difference designed to illegitimate children, see BATON-SINISTER.

Marshalling of Arms. Marshalling is the proper arrangement of such coats as are to be combined in one shield. In the earlier heraldry it was not the practice to exhibit more coats than one on a shield, but the arms of husband and wife were sometimes placed *accollée*, or side by side in separate escutcheons; or the principal shield was surrounded by smaller ones, containing the arms of maternal ancestors; and we not unfrequently find maternal descent or marriage indicated by the addition of some bearing from the wife's or mother's shield. Then followed *dimidiation*, when the shield was parted per pale, and the two coats placed side by side, half of each being shown. By the more modern practice of *impaling* (1, fig. X.), the whole of each coat is exhibited, a reminiscence, however, of the older practice being retained in the omission of bordures, and occasionally tressures, on the side bounded by the line of impalement. The most common case of impalement in English heraldry is where the coats of husband and wife are conjoined, the husband's arms occupying the dexter side of the shield, or place of honour, and the wife's the sinister side, the impaled coat being personal, and non-descending to the children. The arms of states are sometimes impaled, as were those of England and Scotland in the first and fourth quarters of the achievement of Great Britain from the accession of Queen Anne to the Irish Union. Bishops, deans, heads of colleges, and kings-of-arms impale their arms of office with their family coat, giving the dexter side to the

Fig. X.—Marshalling of Arms.

5. Quarterly of six

former. This practice in Scotland, as far as bishops are concerned, belongs only to the post-Restoration episcopacy, as the Scottish sees had no arms till then.

The husband of an heiress (in the heraldic sense) is entitled, according to the more modern usage of British heraldry, to place her arms on a small shield, called an *escutcheon of pretence*, in the centre of his shield, instead of impaling, and in the next generation the arms of the heiress are transferred to one of the quarters of the shield. The escutcheon of pretence is, however, not to be confounded with a small shield of the same kind, called an *escutcheon en surtout* (3), much in use in German, French, and Scottish heraldry, which takes a permanent place in the achievement, and may contain either the paternal arms (as in the Tweeddale branch of the Hay family), some feudal coat, or the coat of an heiress in some past generation, whose memory it has been thought desirable to preserve. It has been the practice for an elected king to place his arms in an escutcheon *en surtout*, the old German emperors placing their family arms on the breast of the imperial eagle.

Quartering, or the exhibiting of different coats on a shield divided both horizontally and vertically, originated in the 13th century, but was little practised till the 14th. The divisions of the shield are called quarters, and are numbered horizontally, beginning at the dexter chief (2). Arms are quartered on various accounts: (*a*) To indicate dominion. A sovereign quarters the ensigns of his different states. On the tomb in Westminster Abbey of Eleanor, daughter of Ferdinand III., king of Castile and Leon, and first wife of Edward I., is the paternal shield of that princess, in which the castle of Castile occupied the first and fourth quarter, and the lion of Leon the second and third. The received rule regarding the quartering of the ensigns of different states is that precedence is given to the most ancient, unless it be of inferior importance. The kings of England, owing to their supposed claim to the French throne, long bore France in the first and fourth quarter, and England in the second and third. In the arms of the United Kingdom, as now borne, England occupies the first and fourth quarter, Scotland the second, and Ireland the third—the relative positions, however, of England and Scotland being reversed on the official seals of Scotland. Feudal arms are sometimes quartered by subjects. Some of the peers of Scotland bear arms of this description. (*b*) Arms of augmentation or special concession accorded to a subject by his sovereign by way of honour, are sometimes granted to be borne quarterly with the paternal coat. These sometimes include a portion of the royal insignia, and have precedence of the paternal coat. (*c*) The most usual reason for quartering is to indicate

descent from an heiress who has married into the family. Where there is but one heiress, her coat occupies the second and third quarters of the shield, and the paternal arms the first and fourth. When there are more than one, they are marshalled in the successive quarters in the order of the intermarriages. Where more than four coats have to be marshalled, the number of vertical lines is increased, and the divisions, though more than four, are still called quarters (5). Where there is an odd number of coats, the last quarter is usually filled up by repeating the first. One of the quarters may itself be quartered, when the heiress was entitled to bear a quartered coat: the shield is then said to be *counterquartered* (4), and its primary quarters are called *grand quarters*. In the course of generations a shield may thus sometimes be inconveniently crowded by the accumulation of coats, including the coats to which each heiress may, in a similar way, have become entitled; and in Germany sometimes above twenty coats (generally coats of dominion) are found marshalled in one escutcheon; but, in British heraldry, families entitled to a number of quarterings usually select some of the most important. A quartered coat may be surrounded by a bordure (for difference), in which case it is treated as one coat.

In the heraldry of the Highlands of Scotland, which is not older than the 16th century, a system of quartering prevailed quite irrespective of family alliance, the quarters being changed under different modifications, with figures partly borrowed from the old monumental sculpture of the country, including the eagle, the fish, the hand with the red cross, and the one-masted galley of Lorne.

The expression 'quarterings' is sometimes loosely used for descents in cases where there is no right to quarter from representation. The eight or sixteen quarterings which in former days were on the Continent essential for the holder of nearly every public office, which were, till lately, often found ranged round the Scottish funeral escutcheon, and which are still important for many purposes in Germany and Austria, have no reference to representation, but imply purity of blood for four or five generations—i.e. that the father and mother, the two grandmothers, the four great-grandmothers, and also, in the case of sixteen quarterings, the eight great-great-grandmothers, have all been entitled to coat-armour.

Other modes of marshalling are in use on the Continent, as the division of a shield per saltire, or into three parts. The marshalling of a coat *en pointe*, or on a triangular figure issuing from the base of the shield, used to be familiar from the escutcheon of Hanover, borne first in the fourth quarter of our royal achievement, and afterwards *en surtout*, where we have Brunswick impaled with Lüneburg, Saxony in base, and over all the crown of Charlemagne, as belonging to the office of arch-treasurer of the empire.

External Ornaments.—Over and above the shield of arms there are certain accessories in use to be represented along with it, and which together with it constitute an *achievement of arms*. These include the helmet, the crest, the motto, the mantling, the supporters, and the crown or coronet.

Before the beginning of the 14th century a helmet began to be placed above shields of arms, the shield being represented in the position called *couchée*—i.e. suspended from the sinister chief angle. After the couchée attitude was abandoned, the helmet resting on the shield began to vary according to the rank of the bearer, the forms adopted being both unbecoming and fanciful. The following are the forms in use in modern British heraldry: (1) that assigned to the sovereign and royal family, which is full faced, of gold, lined with crimson, and with the visor divided by six projecting bars; (2) the helmet of peers, exhibited in profile, with five bars, of which three or four are shown. The helmets of dukes and

1. Sovereign. 2 Peer. 3. Knight. 4 Esquire

Fig. XI.—Helmets.

marquises are entirely of gold, those of earls, viscounts, and barons of steel, with the bars of gold; (3) the helmet of baronets and knights, of steel, full faced, with the visor thrown back, and without bars; (4) the helmet of esquires and gentlemen, in profile, of steel, and with the visor closed. A helmet is never placed over the arms of any woman except the sovereign.

The *Crest* (q.v.) is an ornament of the head rising above the helmet. Crests first appear occasionally on seals and monuments of the 13th century, the earliest being a radiant ornament somewhat like a displayed fan. Originally a special mark of honour worn by heroes of great valour or holding a high military command, the crest became eventually, in English heraldry at least, an inseparable adjunct of the coat-of-arms. An extraordinary number of crests are sometimes accumulated in German achievements, each on its separate helmet. In our modern heraldry the crest is generally placed on a wreath of two pieces of silk of the livery colours—i.e. the first metal and first colour of the shield, but occasionally on a cap of maintenance or a ducal coronet. In the achievement of the sovereign the helmet is placed immediately above the shield, the crown rests on the helmet, and the royal crest rises from the crown. In the achievements of peers, on the other hand, the helmet rises from the coronet, which is placed immediately over the shield.

The *motto* is placed within an escrol either over the crest or below the shield. It bears in many cases an allusion to the family name or arms, or to the crest.

The *mantling* or *lambrequin* is an appendage hanging down from the helmet and passing behind the escutcheon. It is considered to be derived either from the contoise, an ornamental scarf represented in seals and monuments of the 13th and 14th centuries, or from the military mantle or robe of estate. Its comparatively irregular shape in more modern instances has been explained as indicative of the tattered condition to which it has been reduced in the field of battle. Tassels are sometimes appended, and when treated as a robe of estate the bearings of the shield are occasionally repeated on it. In British heraldry the mantling of the sovereign is of gold, lined with ermine; that of peers of crimson velvet, lined with ermine. Knights and gentlemen have either the livery colours of the shield, or, as the practice is in Scotland, crimson velvet lined with silver.

The *Crown* (q.v.), *Coronet* (q.v.), and *Mitre* (q.v.) are adjuncts to the shields of those whose dignity or office entitles them to be thus distinguished.

Supporters.—These figures placed on each side of an armorial shield, as it were to support it, were at first purely decorative, generally, however, having allusion to the arms or descent of the bearer; but they soon came to be considered indicative of his being the head of a family of eminence or distinction. The most usual supporters are animals,

real or fabulous; but men in armour are not unfrequent, as also naked men or savages, often carrying clubs, and wreathed about the head and middle. On early seals a single supporter occasionally occurs, and there are instances of the escutcheon being placed on the breast of an eagle displayed. The dexter and sinister supporters are often, and almost always in continental heraldry, alike. In British heraldry, however, the two supporters are in many cases different; and where the bearer represents two families, a supporter is sometimes adopted from the achievement of each. The rules restricting the right to supporters are different in different countries. In England their use is confined to the royal family, peers, knights of the Garter, and knights Grand Cross of the Bath (with the last the right does not transmit to descendants), the heads of a very few families out of the peerage, who derive their right from an old patent or early usage, and the chief mercantile companies of London. In Scotland the right extends to the chiefs of important clans, and the representatives of minor barons who had full baronial rights prior to 1587, the date of the act which finally excluded the minor barons from parliament. Baronets of Nova Scotia have as such no right to supporters, though many of them bear them in respect of their baronial qualifications. It is considered to be in the power of the Scottish King-of-arms to confer them *ex gratia*, a right which has been sparingly exercised, except for the period between 1790 and 1820.

Any collar and badge of an order to which the bearer may have a right forms properly a part of his achievement, the collar surrounding his shield, and the badge being suspended from it. The badge of Nova Scotia is suspended by an orange tawny ribbon from the shield of baronets of Scotland; and other baronets have the arms of Ulster in a canton or an inescutcheon (see BARONET). Certain officers of state accompany their shields with marks of their rank. The Duke of Norfolk as Earl Marshal places saltirewise, behind his shield two truncheons, tipped above with the arms of England and below with his own arms. The Lord Justice-general of Scotland in like manner places two swords saltirewise behind his shield.

The full achievement of the sovereign of the United Kingdom of Great Britain and Ireland is shown in fig. XII. Its full blazon is: Quarterly,

Fig. XII. Royal Arms of the United Kingdom.

first and fourth gules, three lions passant gardant in pale, or, for England; second, or, a lion rampant within a double tressure flory-counterflory gules, for Scotland; third, azure, a harp or, stringed argent, for Ireland; all surrounded by the Garter. *Crest.*—Upon the royal helmet, the imperial crown proper, thereon a lion statant gardant or, imperially crowned proper. *Supporters.*—Dexter, a lion rampant gardant or, crowned as the crest. Sinister, a unicorn argent, armed, crined, and unguled proper, gorged with a coronet composed of crosses patée and fleurs-de-lis, a chain affixed thereto passing between the fore-legs, and reflexed over the back, also or. *Motto.*—'Dieu et mon Droit,' in the compartment below the shield, with the Union rose, shamrock, and thistle engrafted on the same stem.

This article may appropriately conclude with a short account of the various ways in which the royal arms of England, Great Britain, and the United Kingdom have been borne. The Great Seal of Richard Cœur-de-Lion, made after his return from the third crusade, had the three lions passant gardant (or leopards) in pale, as they have ever since been depicted. In 1340 Edward III., in virtue of the supposed right of his mother, assumed the title of king of France, and quartered the arms of France (azure, semé of fleurs-de-lis or) with those of England, giving the precedence to the former. Richard II. sometimes bore the reputed arms of Edward the Confessor (azure, a cross flory between five martlets or) impaled with his quartered coat, giving the former the precedence. In conformity with the practice in France, the fleurs-de-lis were in the later part of the reign of Henry IV. reduced to three in number. No further change took place in the royal escutcheon until the time of James I., except that Mary, on her second Great Seal, made after her marriage with Philip II., impaled the arms of Spain and England.

James VI. of Scotland, on succeeding to the throne of England as James I., quartered the arms borne by preceding sovereigns with those of Scotland and Ireland, the first and fourth quarters being counterquartered France and England, the second quarter being the lion rampant of Scotland; the third, the harp of Ireland. The royal arms were borne similarly by all the sovereigns of the House of Stuart until the reign of Anne, except that William III. bore *en surtout* the coat of Nassau: azure, semé of billets, a lion rampant or. In the reign of Anne the legislative union with Scotland brought about a further change; England impaled with Scotland was placed in the first and fourth quarter, France in the second, and Ireland in the third. The accession of George I. displaced England and Scotland from the fourth quarter, to make way for the arms of Hanover (see *ante—Quartering*). In 1801 George III. laid aside the titular assumption of king of France, and abandoned the French fleurs-de-lis. The arms of England were now made to occupy the first and fourth quarter, Scotland the second, and Ireland the third, while the arms of Hanover were placed *en surtout*. These last were finally abandoned on the severance of Hanover at the accession of Queen Victoria, when the royal escutcheon assumed its present arrangement.

The lion passant (or statant) gardant as the *crest* of England first appears on the Great Seal of Edward III. The supporters borne in former times by the kings of England varied much, particularly during the early period when these appendages of the shield were invested with more of a decorative than an armorial character, and perhaps often left to the fancy of the engraver. When the arms of any of the English sovereigns from Richard II. to Edward IV. are represented with supporters, the animals chosen are almost indifferently lions, antelopes, or white harts, and occasionally their place is supplied by angels. Edward IV.'s shield is sometimes supported on one side by a black bull,

and that of Richard III. in one instance by white boars. During the reigns of Henry VII., Henry VIII., Edward VI., Mary, and Elizabeth, the lion, red dragon, and greyhound were the animals most in vogue; the herald or engraver generally choosing as it suited him two out of the three. James I. for the first time clearly defined the royal supporters, adopting the lion of England and unicorn of Scotland as they have ever since been borne.

At the union of 1603 a different mode of marshalling from what has been described was allowed in Scotland, the arms of that kingdom occupying the first and fourth quarter, and England being relegated to the second. The Act of Union of 1707 contains no provision for the continuance of a special mode of marshalling for Scotland; but the various official seals of Scotland have uniformly reversed the places of England and Scotland, giving precedence to the latter. The royal arms, as borne in Scotland, are also in use to be encircled with the collar of the Thistle outside the Garter. The Scottish crest takes the place of the English, and the unicorn supporter takes precedence of the lion, the former being crowned and gorged with an antique crown.

The full blazon of the old royal arms of Scotland is as follows: Or, a lion rampant gules, armed and langued azure, within a double tressure flory-counterflory of fleurs-de-lis of the second. *Supporters.*—Two unicorns argent, imperially crowned, armed, crined, and unguled or, gorged with open crowns, with chains affixed thereto, and reflexed over the back, of the last. *Crest.*—Upon the imperial crown proper, a lion sejant affrontée gules, crowned or, holding in the dexter paw a sword, and in the sinister a sceptre, both proper. *Mottoes.*—'Nemo me impune lacessit,' and, over the crest, 'In Defence.'

Among standard works on heraldry are Guillim's *Display of Heraldry* (editions of 1610 and 1724); Edmonson's *Complete Body of Heraldry* (1780); Sir George Mackenzie's *Science of Heraldry treated as part of the Civil Law and Law of Nations* (1680); Nisbet's *System of Heraldry* (1722–43; reprinted 1810); De la Colombière's *Science Héroique* (1669); various French treatises of Ménestrier (1671–80); Spener's *Opus Heraldicum* (1690); and the *Nurnberger Wappenbuch*. Among modern treatises: Planché's *Pursuivant of Arms*; Montagu's *Heraldry*; Boutell's *Heraldry, Historical and Practical* (1864); Seton's *Heraldry in Scotland* (1863); Burke's *General Armory*; Bouton's *Traité de Blazon* (1863); Rielstap's *Armorial Général* (Gouda, 1884); *L'Art Héraldique*, by Gourdon de Genouillac (1889); F. E. Hulme's *Heraldry* (1891); and *A Treatise on Heraldry, British and Foreign*, by the Rev. J. Woodward and the writer of this article (2 vols. 1892).

Herat', capital of the most westerly of the three divisions of Afghanistan, stands on the Hari-Rud, at the height of 2500 feet above the sea, in 34° 50′ N. lat., 62° 30′ E. long.; distance from Kabul, 390 miles west. Situated near the boundaries at once of Afghanistan, Persia, and the Transcaspian district of Russian Turkestan, Herat is one of the principal marts of Central Asia, carrying on at the same time extensive manufactures of its own in wool and leather. The vicinity, naturally fertile, has been artificially rendered much more so by means of irrigation, drawn from the Hari-Rud and its tributaries. Owing to this abundance in water, Herat and its district has been at all times famous for its rich crops and excellent fruits, in fact it has been the granary of the north-western portion of Afghanistan and of the adjoining Turkoman country. But the city claims notice mainly on political and military grounds. Long the royal seat of the descendants of Timur, and often a bone of contention between the warlike tribes all round, it is fortified by a ditch and wall, and is commanded on its north side by a strong citadel built under the direction of British officers, amongst whom the late Sir Eldred Pottinger occupied a pre-eminent place. In 1885–86 the fortifications of Herat were examined and armed by the military members of the Afghan Boundary Commission. In modern times the place has acquired a kind of European importance, being, towards Persia and Russia, the key of Afghanistan, which country in turn affords the only approach by land to western India. In this connection Herat has been viewed as an outpost of England's eastern empire against Russian intrigue and encroachment. Hence it has been alike the subject of treaties and the occasion of wars between Great Britain, as the mistress of India, and Persia, as virtually a vassal of Russia. This feature of the history of the city was more specially developed in connection with the last conflict between Persia and England. In November 1856 the Shah, regarded by the British government as a vassal and agent of the Czar, captured Herat, while actually conducting negotiations for an amicable adjustment at Constantinople; but he was within a few months constrained to relinquish his prey and renounce his claims by a British expedition directed against the opposite extremity of his empire. Since Russia, after subduing the Tekke Turkomans and after having annexed the oasis of Merv (1884), pushed her frontiers as far as Chihl Dukhteran and Kosh Assiah, which is from 30 to 40 miles distant from the gates of Herat, the political importance of the place has grown immensely, and Herat is actually the pivot of the whole Central Asian question. From a commercial point of view Herat has been at all times an emporium for the trade between Central Asia, Persia, and India, as the caravan roads leading from the Oxus and from the Indus towards Persia and Western Asia had found here their point of junction. Indigo, dried fruits, dyes, asafœtida, rice, wool, carpets, raw hides, silk, and leather wares are the chief items of export, whilst chintzes, cloth, sugar, ironwares, and European arms are imported from the West, and quite recently to a large extent from Russia. In 1890 it was in contemplation to bring Herat into railway connection either through a branch-line coming from the Transcaspian railway from Dushak *viâ* Sarakhs in the north, or *viâ* Kandahar from the south, in which case Herat will again acquire its ancient importance from a commercial point of view. The town, famous in the time of Sultan Husein Baikara for its splendid buildings, is to-day a heap of ruins, out of which the citadel, the Charsu, the Tuma Musjid, and parts of the Musallah are prominent as remnants of a bygone glory. The population, consisting chiefly of Persians, Tajiks, and Chihar Aimaks—Afghans constitute only the garrison—has fluctuated within the century from 100,000 to 10,000; the average pop. now being about 30,000. See Malleson's *Herat* (1880); Yate's *Northern Afghanistan* (1888).

Hérault, a maritime department in the south of France, bounded on the south-east by the Gulf of Lyons, is oval in form, 84 miles in greatest length from east to west, and has an area of 2393 sq. m. Pop. (1872) 429,878; (1891) 461,651. It is occupied in the north and north-west by chains of the Cevennes; but the mountainous tracts give place to low plains as the coast is approached, and these in turn to salt-marshes and lagoons next the sea. The largest of the lagoons (*étangs*), Thau, covers nearly 20,000 acres. The principal rivers are the Hérault, the Orb, and the Lez, which rise in the Cevennes and pursue a generally southward course to the Mediterranean. In the neighbourhood of the *étangs* the climate is unhealthy, especially in summer, when agues and fevers prevail; but elsewhere throughout the

department it is unusually fine, though in summer very hot and dry. About a fourth of the entire area consists of arable land. Previous to the devastating attacks of the phylloxera, this department was counted amongst the most important of the wine-growing districts of France. The acreage planted with vines has in ten years decreased from 480,000 to 154,000 acres, and the yield of wine from 390 to about 125 million gallons. The cultivation of olives and the breeding of silkworms and sheep are important industries, as are also the preparation of brandy and liqueurs, the manufacture of cloth, glass, soap, and candles, and tanning. Coal is the chief mineral mined. Large quantities of salt are prepared from the saline marshes; and from the shore lakes and the sea immense quantities of fish are obtained. This department is divided into the four arrondissements of Béziers, Lodève, Montpellier, and Saint-Pons. Montpellier is the capital.

Herbal, originally a book containing an account of all known plants with their medicinal properties, is now a book containing descriptions only of those plants which possess medicinal properties. See PLANTS, Vol. VIII. p. 222.

Herbarium, or HORTUS SICCUS ('dry garden'), a collection of specimens of dried plants, intended for the future study and examination of botanists. Specimens intended for the herbarium should be as perfect in all their parts as possible. They are laid between layers of blotting or botanical paper, and subjected to pressure to dry them. The pressure should be light at first, but increased as the process of drying goes on. The paper requires to be changed frequently—daily in the case of succulent specimens. Special methods have to be adopted in the case of very succulent specimens, such as orchids, &c.: only very slight pressure must be given; and subjecting them to constant uniform heat, as in hot sand, placing them in an oven, or suspending and turning them before the fire, enveloping them first of course in paper, indicate some of the modes of proceeding with such-like specimens. When dried they are mounted on paper, and, if they are to be of any scientific value, the generic and specific names of each should be attached, along with all other data bearing on its identity, such as habitat, &c. Care must be taken to preserve specimens from the ravages of moths and beetles by frequent inspection, by the aid of camphor, and by the occasional application of a little corrosive sublimate.

Herbart, JOHANN FRIEDRICH, a German philosopher, was born at Oldenburg, May 4, 1776. At a very early age he was familiar with religious and metaphysical doctrines and discussions, and in his eighteenth year he became the pupil of Fichte at Jena. In 1805 he was appointed extra-ordinary professor of Philosophy at Göttingen; in 1809 he went to Königsberg as Kant's successor; but in 1833 returned to Göttingen, where he remained till his death, August 14, 1841. His collected works were published by his scholar Hartenstein (12 vols. 1850–52; new ed. 1883 *et seq.*).

Herbart starts from the Kantian position by analysing experience. In his system logic, metaphysics, and æsthetics rank as co-ordinate elements. Logic deals with the formal elements of thought, metaphysics and æsthetics with its content. Of these two the former investigates those of our empirical conceptions which are given us in experience, and which cannot be alienated from our thought, whilst the latter deals with those conceptions which involve judgments of approval or disapproval. The most characteristic features of his thinking are, however, these. He posits a multiplicity of 'reals,' or things which possess in themselves absolute existence apart from apperception by the mind of man. He rejects the notion of separate mental faculties, substituting in their place the conception of primordial presentations or forces, from whose action and interaction all psychical phenomena result. From the conditions which determine the equilibrium and movement of these presentations he deduces a statics and a dynamics of mind, both amenable to mathematical manipulation, and thus introduces psychology to a place among the exact sciences. Ethics he ranks as a branch of æsthetics; it investigates the agreement or disagreement between volition and the fundamental moral ideas.

His works on the science of education have a peculiar value, and have been much studied of late. See books on Herbart by Thilo (1875), Zimmermann (1877), and Wagner (7th ed. 1894); De Garmo, *Herbart and the Herbartians* (1895), the translation of Herbart's *Science of Education* by Mr and Mrs Felkin (1895); and Ufer's *Pedagogy of Herbart* (trans. 1896).

Herbelot, BARTHELEMY D' (1625–95), orientalist, was born in Paris, and became (1692) professor of Syriac in the Collége de France. His *Bibliothèque Orientale*, was published after his death by Galland (1697; 3d ed. 4 vols. 1777–83). It is a universal dictionary of all knowledge known to the Orient, and is principally based upon the Arabic work of Hajji Khalfa; although lacking in critical accuracy, it is full of important information for those who do not read Arabic and other oriental tongues.

Herbert. Herbert Fitz-Herbert was chamberlain and treasurer to King Henry I. Seven or eight generations later, we find the Herberts diverging into several distinct branches, including the lines of the Earls of Powis (now extinct in the male line), of the Lords Herbert of Cherbury (also extinct), the Herberts of Muckross, and also several untitled branches which have flourished upon their ancestral lands in England, Wales, and Ireland. In the reign of Henry V. Sir William Herbert of Raglan Castle, County Monmouth, received the honour of knighthood in reward of his valour in the French wars. His eldest son, a staunch adherent of the House of York, was created Earl of Pembroke by Edward IV. in 1468, but fell into the hands of the Lancastrians after the battle of Danesmoor, and was beheaded the following day. His son became Earl of Huntingdon.

The title of Earl of Pembroke was restored to the Herberts in 1551 in the person of the son of an illegitimate son of the first earl. The new earl was one of the most influential noblemen of his age, and one who took an active part in public affairs, both as a statesman and a soldier. By his wife, who was a sister of Catharine Parr (the last queen of Henry VIII.), he had a son Henry, second earl, to whose countess, Mary ('Sidney's sister, Pembroke's mother'), Sir Philip Sidney dedicated his *Arcadia*. It has been attempted to identify Shakespeare's 'W. H.,' the 'only begetter' of the *Sonnets*, with the third earl, who succeeded in 1621. The fourth earl, some time Lord Chamberlain to Charles I., and Chancellor of the university of Oxford, was also Earl of Montgomery. The eighth earl held several high offices under Queen Anne, including that of Lord High Admiral. Lord Herbert (q.v.) of Lea was a younger son of the eleventh earl; and his son became (1862) thirteenth Earl of Pembroke, and tenth Earl of Montgomery. The Earls of Carnarvon, more than one of whom have gained celebrity in the field of literature, descend from the eighth Earl of Pembroke mentioned above. The recent Earls of Powis are descended from the same stock maternally, the only child and heiress of the last Earl of Powis of the Herbert

stock having married the eldest son of the illustrious Lord Clive, in whose favour that title was renewed in 1804.

Herbert, Edward, Lord Herbert of Cherbury, soldier, statesman, poet, and philosopher, was born of the ancient and noble House of Herbert, apparently on the 3d March 1583, at Eyton in Shropshire. He was sent to Oxford in his twelfth year, and before he had quite quitted his studies he married an heiress considerably older than himself. On the occasion of the coronation of James I. he was made a knight, and invested with various offices. He left home, accordingly, for France in 1608, and in Paris lived in terms of intimacy with the Constable Montmorency, Isaac Casaubon, and other distinguished men. After a brief return to his native country, he set out again in 1610 for the Low Countries, where he joined the arms of Maurice of Orange; and he again offered him his services in 1614. After a campaign, he travelled through Germany and Italy on horseback, and went as far as Venice, Florence, and Rome. On his way back he got into trouble through an attempt which he made to raise a troop of Protestant soldiers in Languedoc for the Duke of Savoy. Shortly after, he returned to England, and was made a member of the Privy-council; then sent to France, first as extraordinary ambassador, and then as ordinary ambassador. He tried, but without much success, the difficult task of negotiation between Louis XIII. and his Protestant subjects, was ultimately dismissed, and in spite of eager solicitation never received any further appointment. He was elevated first to be a peer of Ireland, and then in 1629 to be a peer of England, with the title of Baron Herbert of Cherbury. When the Civil War broke out he at first sided with the royalists, but ultimately surrendered his castle to the parliamentarians, with whom he afterwards lived on easy terms. He was commonly regarded as having saved his possessions at the expense of his honour. He died in London, 20th August 1648.

The work by which Herbert, the friend of Donne, Selden, Ben Jonson, Grotius, and Gassendi, was best known to his contemporaries is his *De Veritate* —an anti-empirical theory of knowledge, which in many respects anticipates the common-sense philosophy of the Scottish school, and is at times even Kantian. His *De Religione Gentilium* (1663) is a 'natural history of religion,' by means of which Herbert finds that all religions, amidst their extravagances or follies, recognise what were for him the five main articles of religion—that there is a supreme God, that he ought to be worshipped, that virtue and purity are the main part of that worship, that sins should be repented of, and that there are rewards and punishments in a future state. In virtue of this 'charter of the deists,' Herbert is not unjustly reckoned the first of the deistical writers. The *Expeditio Buckinghami Ducis* (1656) is a vindication of his patron's ill-fated expedition. The ill-proportioned *Life and Raigne of King Henry VIII.* (1649) glorifies Henry overmuch, and is by no means accurate. His best-known work, the *Autobiography*, a brilliant picture of the man and of contemporary manners, may fairly be regarded as a masterpiece in its kind; but it is disfigured by overweening conceit and self-glory in his own personal beauty, noble blood, valour in Quixotic duels, favours from famous ladies, and generosity, and is not to be regarded as veracious. It comes down only to 1624. The *Poems*, Latin and English, which may be divided into sonnets, elegies, epitaphs, satires, miscellaneous lyrics, and occasional pieces, reveal in their author a representative of Donne's, or the 'metaphysical,' school; many, in the judgment of a recent editor, are of real and true poetry, in some respects resembling Browning, in some anticipating Tennyson. See Rémusat's monograph on Herbert (Paris, 1874); Churton Collins's edition of the Poems (1881); and Sidney L. Lee's edition of the Autobiography, with introduction and continuation (1886).

Herbert, George, an English poet, was born in Montgomery Castle, in Wales, on the 3d April 1593. His family was a younger branch of that of the Earls of Pembroke. His eldest brother was Lord Herbert (q.v.) of Cherbury, who says of him: 'My brother George was so excellent a scholar that he was made the public orator of the university of Cambridge, some of whose English works are extant, which, though they be rare in their kind, yet are far short of expressing those perfections he had in the Greek and Latin tongue, and all divine and human literature. His life was most holy and exemplary, in so much that about Salisbury, where he lived beneficed for many (?) years, he was little less than sainted. He was not exempt from passion and choler, being infirmities to which our race is subject; but, that excepted, without reproach in his actions.' George Herbert's mother was a Newport, of the old Shropshire family of the Newports of High Ercall. She was left a widow, and devoted herself to the education and training of her seven sons, in which effort she was singularly successful. Her memory has come down to us as one of those many mothers of the English race to whom it owes so much. Under her influence and that of Dr Neville, Dean of Canterbury and Master of Trinity College, Cambridge, the foundations were laid of a character of almost perfect beauty. In 1614 George Herbert was elected Fellow of his college, and in 1619 promoted to the office of Public Orator, in which place he continued eight years, and, as Izaak Walton says, 'managed it with as becoming a grace and gaiety as any had ever before or since his time.' 'If during this time,' he continues, 'he expressed any error, it was that he kept himself too much retired, and at too great a distance from all his inferiors, and his clothes seemed to prove that he put too great a value on his parts and parentage.' The antecedents of his family, indeed, and his position at the university, naturally led him to expect advancement at court; but on the death of King James his thoughts became more decidedly drawn towards a distinctly religious life—a life which his mother had always wished him to follow. After a period of seclusion in the country, he finally decided to relinquish all expectation of court favours, and to devote himself entirely to the religious life. In 1626 he was made prebendary of Layton Ecclesia in the diocese of Lincoln, and in 1630, the year after his marriage to a kinswoman of the Earl of Danby and daughter of Mr Charles Danvers of Bainton, Wilts, he was presented, by the favour of his kinsman the Earl of Pembroke, to the vicarage of Bemerton, near Salisbury; Charles I. saying, when the earl solicited the presentation which had lapsed to the crown, 'Most willingly to Mr Herbert, if it be worth his acceptance.' He only enjoyed this vicarage for three years, being buried on 3d March 1633: yet in that short time he left a memory which still survives. No one who reads his *Country Parson*, a description of an ideal parson's life, which is doubtless to a considerable extent a picture of his own life and conduct, will be surprised at this fact. Walton says of him, 'his aspect was cheerful, and his speech and motion did both declare him a gentleman; for they were all so meek and obliging that they purchased love and respect from all that knew him.' He was naturally the intimate of the most cultured natures of his day, but the reality of religious life led him, as it

has done others, to a perfect sympathy with the uncultured and the ignorant. He was an accomplished musician, who recognised in music not a science only, but a divine voice; and his poetry is the natural result of his training and of his life. It exhibits a singular combination of the attributes of a courtier, a gentleman, and a saint. It manifests a knowledge of life, and of the world, and a certain strength and force of thought and of expression which has made his verses the favourite reading of men who are not generally attracted to sacred and devotional poetry; and this quality will probably ensure for his poems a lasting, though perhaps limited, number of students and admirers.

See his *Works in Prose and Verse*, with Life by Walton, and notes by Coleridge (1846); editions by Nichol (1863) and Grosart (1876); the present writer's preface to *The Temple* (1882); and a new *Life* (S.P.C.K., 1893).

Herbert, Sidney, Lord Herbert of Lea, minister and statesman, was the son of the eleventh Earl of Pembroke by his second wife, the daughter of Count Woronzow, and was born at Richmond, 16th September 1810. Educated at Harrow and at Oriel College, Oxford, he devoted himself to public life, and entered the House of Commons in 1832 as member for South Wilts, which he represented until his elevation to the peerage in 1861. He began his political career as a Conservative, and was Secretary to the Admiralty in Sir R. Peel's administration from 1841 to 1845, when he became Secretary-at-war. It fell to him to oppose Mr Cobden's motion for a select committee to inquire into the effect of the corn laws. He went out of office with his party in 1846. In 1852 he was again Secretary-at-war, under the Aberdeen ministry, and, in consequence, the 'horrible and heart-rending sufferings' of the army before Sebastopol were laid in a great degree at his door. He was for a few weeks Colonial Secretary in the first administration of Lord Palmerston in 1855, and Secretary-at-war in his second administration in 1859. Great improvements in the sanitary condition and education of the army, the amalgamation of the Indian with the royal army, and the organisation of the volunteer force signalised his army administration. He largely reformed the War Office, and was devoting himself with equal zeal and intelligence to his ministerial duties when, owing to failing health, he resigned his seat in the House of Commons, and in 1861 was called to the Upper House, under the title of Baron Herbert of Lea. He died August 2, 1861. He was heir-presumptive to the earldom of Pembroke, and his son (1850-95, author of *South Sea Bubbles*) became in 1862 thirteenth earl.

Herb Gerard. See Bishopweed.

Herbivora ('plant-eaters'), in some of the classifications of the Mammalia, has been regarded as an order (co-ordinate with Carnivora), and by some been divided into Artiodactyla and Perissodactyla. See Mammalia, Ungulata.

Herb Paris. See Paris.

Herb Robert. See Geranium.

Herbs, or Herbaceous Plants, are those which do not form a *persistent* woody stem above ground. They are annual, biennial, or perennial. An annual springs from seed, blossoms and dies in one season. A biennial vegetates only during the first growing season, and stores up nourishment in its root-stock which persists through the winter; during the second growing season the root-stock sends up flowering shoots, and after fructification the whole plant dies. When the root-stock perennates, and only the aerial shoots die at the end of each growing season, the plant is perennial. See Pot-herbs.

Herculaneum, an ancient city of Italy, so called from the local worship of Hercules, was situated at the north-western base of Mount Vesuvius, about 5 miles E. of Naples. Considerable obscurity envelops its early history; it is supposed, however, to have been of Phœnician origin, and to have been occupied afterwards by Pelasgians and Oscans. It subsequently was conquered, with all the rest of Campania, by the Samnites, and later it fell into the hands of the Romans. In 63 A.D. the city was seriously injured by a violent earthquake; and in 79 it was buried, along with Pompeii and Stabiæ, by the memorable eruption of Vesuvius (q.v.) which took place in that year. It now lies at a depth of from 40 to 100 feet below the surface, and is filled up and covered with volcanic tufa, composed of sand and ashes, and consolidated to some extent by water, which is often thrown up in great quantities during volcanic eruptions. Above it, on the modern surface, are Portici and Resina, two villages now absorbed in the suburbs of Naples. In 1706, on the occasion of deepening a well, fragments of mosaics were first brought up; but little was done for systematic excavation till 1738, when explorations were commenced under royal authority. It was then discovered that the building near the bottom of the well, from which the first relics were obtained, was the theatre. This building was forthwith explored and cleared, and several statues, both in bronze and marble, were extracted from it. Excavations were carried on but to a limited extent, not only in consequence of the hardness of the tufa, but from the fear of undermining the dwellings on the surface. Hence but a portion of this entombed city is yet visible, the chief edifice shown being still the theatre, which had been built a short time before the fatal eruption. It has eighteen rows of stone seats, and could accommodate 8000 persons. Part of the Forum with its colonnades, a colonnade

General view of the Excavations at Herculaneum.

(mistaken at first for a basilica), two small temples, and a villa have also been discovered; and from these buildings many beautiful statues and remarkable paintings have been obtained. Of late years excavations have been resumed under government, with important results, particularly as to the plan of Herculaneum, and in 1880 ruins of extensive baths and of the accessory buildings were brought to light. A general view of the exposed city (1889) is given from a photograph. Among the art-relics of Herculaneum, which far exceed in value and interest those found at Pompeii, are the statues of Æschines, Agrippina, the Sleeping Faun, the Six Actresses, Mercury, the group of the Satyr and the Goat, the busts of Plato, Scipio Africanus, Augustus, Seneca, Demosthenes, &c. These treasures, together with such vases and domestic implements as have been found, are on view in the National Museum at Naples. For the classical student *La Villa Ercolanese dei Pisoni*, by Comparetti and De Petra (Turin, 1883), is recommended.

Hercules (Gr. *Hēracles*), the beloved son of Zeus by Alcmene (of Thebes), was intended by his father to be king of the Argives; but Hera, the jealous spouse of Zeus, by a trick caused Eurystheus to become king of Argos. Nor was her wrath satisfied with this; she made Hercules serve Eurystheus, by far the inferior man. And he enjoined hard adventures on Hercules, even sending him to Hades to fetch up the dog Cerberus. Thus Hercules was doomed to a life of trouble, and became the type amongst the Greeks not only of manly strength, but of manly endurance. Besides the labours imposed on him by Eurystheus, Hercules undertook adventures on his own account, killing a sea-monster that ravaged Troy, and destroying Troy when the mares promised him as reward for killing the monster were denied him. His love of horses also led him to kill Iphitus, though his guest. Finally, after death, he himself joined the banquet of the deathless gods, with Hebe as his wife; but his phantom, armed with bow and arrow and gold baldric, with wild boars and lions wrought upon it, terrified the dead in Hades. Thus far according to Homer.

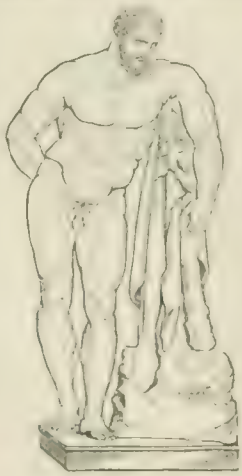
Hesiod adds four more labours, imposed by Eurystheus—the destruction of the Nemean lion, of the Lernæan hydra, fetching the oxen of the triple-bodied Geryones, and the golden apples of the Hesperides; and Hesiod includes amongst the *parerga*, or voluntary exploits, freeing Prometheus from the eagle which tortured him. From later authors we hear of yet more labours, the number of which was first fixed at twelve by Pisander (who lived about 650 B.C., and wrote an epic poem on the adventures of Hercules), though this number was not regarded as a canon either of poetry or art. They are the destruction of the Erymanthian boar, and of the Stymphalian birds; the capture of the Cretan bull, of the stag of Cerynneia, and of the horses of Diomedes; the cleansing of the stables of Augeas; and obtaining the girdle of the queen of the Amazons. Many voluntary exploits are added by later writers to the *parerga* mentioned by Homer and Hesiod, and are as a rule brought into connection with the Homeric story of Hercules, the outlines of which they fill up. Thus, Homer mentions Megara as the wife of Hercules; later writers recount that she was the daughter of the king of Thebes, and that her hand was bestowed on the hero in reward for having freed the Thebans from their tribute to the Minyæ. The story of Hercules' service as a slave to the Lydian Omphale is connected with the Homeric story as being the atonement for the murder of Iphitus. When all other resources fail, topography is made to afford the connection. Thus, the fight with the Centaurs is connected with the labour of destroying the Erymanthian boar, because the scene of the one adventure is in the neighbourhood of the other. It is on his way to Thrace in quest of the horses of Diomedes that Hercules rescues Alcestis, who had given her life for that of her husband Admetus, the guest-friend of Hercules. It is on his way back from the west, when he is returning with the cattle of Geryones by way of Italy to Greece, that he destroys the monster Cacus, who stole his oxen. It is on his way to Gadira in search of Geryones' oxen that he travels in the mystic beaker given to him by the sun-god. And finally, it is *en passant* that he founds the Olympian games also. But in all cases we find that Hercules has become the national hero of the Greeks, and that he is regarded not only as the type of manly endurance, but also as the self-sacrificing hero who succours the oppressed and rids earth of its monsters. As to the manner of his death nothing is said by Homer, but in later times the story was, that, in the agonies caused by the poisoned robe of Nessus sent to him in all innocence as a love-charm by his wife, Deianira, he threw himself on to a funeral pyre on Mount Œta, and was thence carried up to heaven.

It is maintained by some scholars that the origin of Hercules as a mythical figure is not Greek, not even Indo-European, but oriental. And in support of this view there are traits to be found both in literature and art which are undoubtedly oriental. Thus in literature the mystic beaker in which Hercules travels to Gadira is undoubtedly the symbol of the oriental sun-god. The number (twelve) of Hercules' labours is that of the signs of the zodiac. In art the lion-skin which is the characteristic garb of Hercules is undoubtedly a loan from the East; and the resemblances between ancient types of Hercules and the idols of the Phœnician god Besa are undeniable. And even the Greeks themselves identified Hercules with Melcarth of Tyre. In his physical strength Hercules brings to mind Samson, and Samson, on the other hand, has been explained by a venturesome mythologist (Goldziher) as being, like Hercules, a solar hero. But on examination the hypothesis of the oriental origin of the figure of Hercules breaks down. It is quite true that there are amongst the many and diverse elements in the myth of Hercules some of undoubtedly oriental origin; but none of these can be traced back further than the time of Pisander. The story of Hercules as told in Homer is purely Greek. Thus the number (twelve) of Hercules' labours, which forms such an admirable basis for the theory that Hercules is a solar hero and of oriental origin, cannot be traced back further than the time of Pisander, by whom it may well have been borrowed from some eastern story, for he lived in Rhodes, which was exposed to oriental influences. The beaker of the sun-god, again, is borrowed from the East, but is no part of the equipment of the original Homeric Hercules. The lion-skin, which subsequently became the characteristic garb of Hercules, was imported from the Orient. This is indicated by the fact that Pisander first introduced it into literature, and is confirmed by the circumstance that it appears in art for the first time in images from Cyprus, which were plainly produced (as might be expected in Cyprus) under oriental influences. But the lion-skin is not found in literature older than Pisander, and it is uniformly absent from older works of art. Finally, the resemblances between the ancient types of Hercules and the idols of the Phœnician Besa are in part due to the fact that the latter date from the time when Phœnician art was already under the influence of Greek.

That the Greeks themselves identified Hercules with some strange god, whether of Egypt or of

Tyre, is natural enough, but proves nothing. They, like the Romans, were ever on the alert to identify the gods they knew of old with the new deities of foreign nations. Indeed, it is in this tendency that we have to look for the explanation of the growth of the story of Hercules. It is because the Greeks recognised, or thought they recognised, their national hero in the oriental sun-god, that traits and stories belonging to the latter became attached to the former. In this way the hero of the Lydian story was identified with Hercules, and the story of his service to Omphale transferred to Hercules. On the same principle we may probably detach the Italian story of the monster Cacus as an accretion. The Italians recognised in Hercules their own native Genius Jovis, of whom the Cacus story was originally told. Not only was the story absorbed into the Hercules-cycle of myths, but Hercules eclipsed the Genius Jovis in Italy itself. It has, indeed, been supposed that the story of Hercules was known to the Græco-Italians, the common ancestors of Greeks and Italians; but, apart from the doubt which now attaches to the very existence of Græco-Italians, the Latin name Hercules is undoubtedly like that which it stands for borrowed from the Greek. Hercules, as a matter of philology, is a loan-word from the Greek Heracles.

Not only, however, is it possible to strip the original Homeric story of Italian and oriental accretions; it is also possible to trace its growth within the limits of Hellas itself. For as the Greeks identified their national hero with foreign deities and heroes, so Hercules came to be the national Greek hero, because the various Greek states identified him with various local heroes. Thus the Ætolian myth of Deianira and the robe of Nessus came to be attached in the time after Homer to Hercules. And even in the Hercules of Homer and Hesiod we can detect at least two local heroes. The son of Alcmene of Thebes was probably not originally the same hero as the Hercules whose exploits in destroying the Lernæan hydra, Nemean lion, and the Erymanthian boar are localised in the Peloponnese. And this view is confirmed by the fact that, whereas the Peloponnesian hero is named Heracles, the Theban hero was known as Alcæus ('the strong man'), or Alcides ('son of strength'), and compilers of myths had to allege that the change of name from Alcides, the less known name, to Hercules, the better known, was ordained by the Delphian oracle.



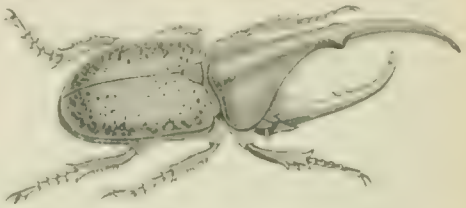
Farnese Hercules.

Further back than this it seems impossible to trace Hercules. There is no reason to imagine that Hercules was known to the Indo-Europeans before their dispersion; and even if some of his adventures (e.g. the oldest labour—that of fetching up Cerberus from the nether world) are really solar in character, we need not close our eyes to the fact that the strong man is a natural subject for myths.

In art, Hercules is represented as the type of manly strength, with muscular limbs, curly hair, and somewhat small head; a club and lion's skin are often added. The most notable statue is the so-called Farnese Hercules, found in the baths of Caracalla in 1599, and now in the museum at Naples. It is the work of the Athenian Glycon, but probably a copy of a work by Lysippus.

Hercules, Pillars of, the name given by the ancients to two rocks flanking the entrance to the Mediterranean at the Strait of Gibraltar. According to one version of the legend, they had once been united, but Hercules tore them asunder to admit the ocean into the Mediterranean; another version represents him as causing them to unite temporarily in order to form a bridge. They seem to have been first visited by the Phœnicians about 1100 B.C. Calpe, one of them, is now identified with Gibraltar, and Abyla, the other, with Ceuta.

Hercules Beetle (*Dynastes hercules*), a gigantic lamellicorn beetle from tropical America, sometimes 6 inches in length. The male bears on the thorax an enormous horn, which is met by a shorter upturned horn from the head, the whole resembling a pair of large but somewhat unequal pincers, of which the body of the insect is the



Hercules Beetle (*Dynastes hercules*).

handle. The female is without horns, and decidedly smaller. Another species, *D. tityus*, about 2 inches in length, occurs in the United States. The genus Megasoma is nearly allied to Dynastes. See also Goliath Beetle.

Hercules' Club is the trivial name of a West Indian tree (*Xanthoxylum caribæum Hercules*), for a kind of gourd, and for a species of Aralia.

Hercynian Forest (Lat. *Hercynia silva*), the general designation of the entire wooded mountain-ranges of middle Germany, from the Rhine to the Carpathian Mountains. Different ancient writers apply the name sometimes to one of the constituent ranges, sometimes to another. Modern geographers, and more particularly geologists, apply the term Hercynian system to all the mountain-chains between Westphalia and Moravia. These have for the most part a north-west to south-east strike, and are all older than the close of the Cretaceous period.

Herder, Johann Gottfried, one of the most thoughtful and suggestive of German writers, called by De Quincey the Coleridge of Germany, equally important as a philosopher, a theologian, and a literary critic, was born at Mohrungen, in East Prussia, on 25th August 1744. He studied at Königsberg, and there became acquainted with Kant and Hamann, the 'Magus of the North.' The latter inspired young Herder with love for the poetry of primitive peoples and the study of the obscure beginnings of civilisation, and for the literature and lore of the Orient, especially of the Bible. But perhaps the greatest thing that Hamann did for Herder was to awaken him to intellectual freedom, to emancipate his mind from traditional habits of thinking and stimulate him to prosecute lines of independent search. In 1764 Herder became assistant-teacher in a school, and assistant-pastor in certain churches, in Riga. Being convinced that literature was to be his life's calling, he began to practise it by writing *Fragmente über die neuere deutsche Literatur*

(1766-67), *Die kritischen Wälder* (1769), and minor pieces, in which he maintained that the truest poetry is the poetry of the people, the spontaneous, unartificial expression of the characteristic human nature that is in them; and, in the spirit of Winckelmann and Lessing, he took up a brief for the idiosyncratic development of national genius in opposition to the fashionable pseudo-classicism of the day. He was an impressive preacher, the subject of his sermons, as of all his writings, being man *qua* man in all phases of his essential and complex nature. Leaving Riga in 1769, he spent some months in travel. It was during this tour that he made the acquaintance of young Goethe at Strasburg; from Herder the future literary imperator of Germany learned to understand the realities of life. In 1770 Herder accepted the appointment of court-preacher at Bückeburg; but six years later he exchanged this uncongenial post for that of first preacher in the town church of Weimar, a position which, partly owing to untoward circumstances, partly—and perhaps principally—to his own innate irritability of temper, proved to be little less uncongenial, in spite of his intercourse with Goethe and the other literary celebrities then gathered in Weimar. It was there that Herder died on 18th December 1803.

Herder's love for the songs of the people, for human nature unadulterated, for simple truth warm with the blood of life's reality, in preference to classic grace and coldness, and the beautiful but artificial poetry of cultured minds, found expression in an admirable collection of folk-songs, *Stimmen der Völker in Liedern* (1778-79), in his favourite book, *Vom Geiste der Hebräischen Poesie* (1782-83; Eng. trans. by James Marsh, 1833), *Ueber die Wirkung der Dichtkunst auf die Sitten der Völker* (1778), in a series of oriental mythological tales, in parables and legends, in his version of the *Cid* (1805), and other works. The principal constructive idea of his thinking was, however, what we should now call the sense of the supreme importance of the historical method. The stimulus of this thought is discernible not only in the works quoted above, but in such books as *Ueber den Ursprung der Sprache* (1772), *Die älteste Urkunde des Menschengeschlechts* (1774-76), and especially in his greatest masterpiece, *Ideen zur Geschichte der Menschheit* (1784-91; Eng. trans. by T. Churchill, 1800), which, like so many of his other books, was left uncompleted. This work is not only the ripest product of his thinking; it is, as it were, the capital of his intellectual kingdom, in which are gathered all the wealth and beauty and power of his mind. Besides its great intrinsic value, the book is remarkable for its anticipations and adumbrations of evolutionary theories. Herder shows that higher and higher types of organisation are observable in all things, stones, plants, and animals, until the culminating type is reached in man; and, as the scale is ascended, a closer and closer resemblance to the culminating type is revealed both in organisation and in the development of powers and instincts. Moreover, the more complex the organisation of a being the greater the extent to which that organisation partakes of the forms existent in the lower grades. But he does not vitalise the scheme of the universe by the conception of genetic development, or the doctrine of organic descent. He does, however, recognise, in a more or less imperfect way, the struggle for existence and adaptation to environment. The end for which all things exist that do exist is, he teaches, man, the crowning work of the universe. But man is not merely the crowning work of the universe; he is also, by analogy of reasoning from the laws of nature, the first and rudest link in a still higher series of existences, and what he has in common with them is his pure humanity, his intelligent, sensitive, and spiritual powers. Hence the life-business of man, the loftiest aim of philosophy and religion, is to cultivate these. Herder is one of the few authors who appreciate the poetry in philosophy and the higher synthesis of both with religion; yet he can scarcely be called a great writer. His last years were chiefly occupied, apart from the *Ideen*, with the *Humanitätsbriefe* (1793-97) and an ill-advised polemic against Kant.

His *Sämmtliche Werke* (60 vols.) were published in 1827-30; later issues are Suphan's (32 vols. 1877-87) and his edition (with Redlich) of the 'selected works' (9 vols. 1884 sq.). See *Erinnerungen*, by Herder's widow (1830); the *Lebensbild*, by his son Emil (1846-47); and collections of his *Letters*. The standard *Life* is Haym's (2 vols. 1880-85); but see shorter lives by Kuhnemann (Munich, 1894), Jorel (Paris, 1875), and Nevinson (London, 1884).

Herd, DAVID (1732-1810), born a Kincardineshire farmer's son, spent his life as an Edinburgh clerk and in literary work, being remembered for his collection of *Ancient Scottish Songs, Heroic Ballads,* &c. (2 vols. 1776; reprinted 1869).

Hérédia, JOSE MARIA DE, French poet, born in Cuba of a wealthy house 22d November 1842, came in boyhood to France, where he was educated, and where with short intervals he subsequently lived. He printed occasional poems, sonnets, &c. for private circulation, and though a Spaniard born, he gradually came to be reckoned one of the most gifted and accomplished of French poets. A collection, *Les Trophées*, published in 1894, deal largely with the Conquistadores. He was admitted to the Academie in 1895.

Heredity, the organic relation between generations—especially between parents and offspring. All offspring produced by sexual reproduction, from a male and a female organism, owe half of their essential (nuclear) material to each parent. Therefore through successive generations there persists a constancy of likeness or stability of type, as expressed in the familiar saying that 'like begets like.' Besides this general resemblance between offspring and parent, there is frequently a reappearance of minute features, idiosyncrasies, and peculiar traits; yet this is not inconsistent with the occurrence of variations, which are in part due to the twofold origin of the offspring, and force us to modify the familiar saying into 'like *tends* to beget like.' In many cases, moreover, the offspring exhibits not only parental, but grand-parental or ancestral characteristics, which when very pronounced or remote are called 'Atavisms' (q.v.) or 'reversions.' Nor is the inheritance confined to normal characters, for diseased, pathological, or abnormal conditions of parents or grand-parents often *reappear* in the offspring, though this reappearance is not always due to transmission. Characteristics acquired by the parents, not as outcrops of their innate constitution, but as the results of use and disuse, or as dints from the environment, often *reappear*, though there is lack of evidence that they are transmitted. Finally, throughout successive generations, there is a tendency to sustain the specific average, by the continued approximation of exceptional forms towards the mean of the species.

Denials.—While a few have been so misguided by prejudice as to maintain that there was no transmission at all, and while a few have exaggerated beyond all credence the undeniable tendency of similar work and surroundings to make offspring like their parents, there is no scepticism of any importance except that which denies the trans-

mission of individually acquired characters. Be it clearly understood that 'natural inheritance' is a certain fact: innate, constitutional, congenital, or germinal qualities, and the results of these in the parents, are certainly transmissible to the offspring: the disputed problem, which awaits experimental evidence, is to what degree, if any, extrinsic, functional, or environmental modifications acquired by the parents can be handed on as a legacy for good or ill to the offspring. That such acquisitions often recur is indubitable, but it is not at present certain that they recur because they have been transmitted. They may of course be the result of the action on the offspring of the same conditions as first evoked them in the parents.

Problems.—In regard to the relation between parents and offspring, there are three great problems to be discussed. What is the peculiarity of the germ-cells which enables them (in most cases after uniting as male and female elements) to develop into organisms essentially like the parents? Granting that the germ-cells are in some respects unique when compared with the ordinary cells of the 'body,' granting that the fertilised egg is in some sense a potential organism, how are we to think of the mechanism of development by which the specific type is reconstructed? Thirdly, what is the probable truth, or present state of opinion, in regard to the transmission of acquired as opposed to constitutional or germinal characters? In addition to these three great problems of individual inheritance, there are minor questions in regard to atavism, reparation of injuries, and the like, detailed practical inquiries as to the inheritance of disease, and, widest of all, those problems of social inheritance which concern the relation between large fraternities of the human species through successive generations.

Mystical Theories. Theories of heredity, like those of many other facts, have been expressed in three sets of terms—theological, metaphysical, and more or less scientific. The ancient hypotheses, that germs were possessed and controlled by spirits, gave place to theories which invoked 'principles of heredity' and 'formative forces,' and these in turn have been displaced by more concrete conclusions. Of most historical importance are the so-called 'mystical' or 'preformation theories,' according to which the male or female germ contained a miniature model of the future organism, and indeed of succeeding generations as well, while the development was merely a gradual unfolding or literal 'evolution.' We still believe of course that the fertilised egg is a potential organism, and that it has great complexity within its apparent simplicity, but the researches of the founders of embryology were enough to show that no miniature models existed, and that development was anything but the unfolding of a bud. See EMBRYOLOGY.

Pangenesis.—Many naturalists have attempted to explain the uniqueness of the germs or germ-cells by regarding them as concentrations of units collected from the various structures of the body. The hypothetical process by which these units are given off from the various organs, travel to the seat of the germs, and are there accumulated to reproduce in the embryo structures like those whence they originated, is termed pangenesis. At such different epochs as are suggested by the names of Democritus and Hippocrates, Paracelsus and Buffon, pangenetic theories were advanced. The first clear theory, however, was that of Spencer (1864), who suggested the existence of 'physiological units,' derived from and capable of development into cells, and supposed their accumulation in the reproductive elements. But the best-known form of the theory is Darwin's 'provisional hypothesis of pangenesis' (1868), according to which (*a*) every cell of the body, not too highly differentiated, throws off characteristic gemmules, which (*b*) multiply by fission, retaining their peculiarities, and (*c*) become specially concentrated in the reproductive elements, where (*d*) in development they grow into cells like those from which they were originally given off. Somewhat later (1876) the ingenious Jäger sought to replace Darwin's gemmules by characteristic 'scent-stuffs,' which were collected from the body into the reproductive elements; he suggested, in other words, what may be called chemical pangenesis. Meanwhile (1872) Galton had been led by his experiments on the transfusion of blood and by other considerations to the conclusion that 'the doctrine of pangenesis, pure and simple, is incorrect.' While reaching forward to something better, he still allowed a limited pangenesis to account for those cases which suggest at least that acquired characters are 'faintly heritable.' He admitted that a cell 'may throw off a few germs [i.e. gemmules] that find their way into the circulation, and have thereby a chance of occasionally finding their way to the sexual elements, and of becoming naturalised among them.' In 1883 Professor W. K. Brooks proposed an important modification of Darwin's theory, especially insisting on the following three points: that it is in unwonted and abnormal conditions that the cells of the body throw off gemmules; that the *male* elements are the special centres of their accumulation; and that the *female* cells keep up the general resemblance between offspring and parent. For criticism of the numerous suppositions involved in the various theories of pangenesis, the reader is referred to the works of Galton, Ribot, Brooks, Herdman, Plarre, De Vries, and others (see bibliography); it is enough for our purpose to notice, in the light of the next step of progress, the comparative gratuitousness of any such special theories.

Fact of Continuity. As far back as 1849 Owen pointed out that in the developing germ it was possible to distinguish between those cells which became much changed to form the 'body,' and those which remained virtually unchanged and formed the reproductive organs. The same distinction was emphasised by Haeckel and by Rauber, while Jäger expressed his views very explicitly as follows: 'Through a great series of generations the germinal protoplasm retains its specific properties, dividing in development into a portion out of which the individual is built up, and a portion which is reserved to form the reproductive material of the mature offspring.' This reservation, by which the germinal protoplasm is sheltered from external or corporeal influences, and retains its specific and embryonic characters unchanged from the parent ovum, Jäger called by a now famous phrase 'the continuity of the germ-protoplasm.' Brooks (1876, 1877, 1883) was not less clear: 'The ovum gives rise to the divergent cells of the organism, but also to cells like itself. The ovarian ova of the offspring are these latter cells, or their direct unmodified descendants. The ovarian ova of the offspring thus share by direct inheritance all the properties of the fertilised ova.' In the same way Galton (1872, 1875), using the term 'stirp' to express the sum total of germs, gemmules, or organic units of some kind in the fertilised ovum, maintained that a certain residue is kept apart from the development of the body, to form the reproductive elements of the offspring. The history must also include Nussbaum, who likewise called attention to the very early differentiation and isolation of the sex-elements to be observed in the development of some animals. The general notion independently suggested by the above naturalists is simple enough. At an early stage in the development of the embryo the future reproductive cells of the organism are distinguishable

from those which are forming the 'body.' The latter develop in manifold variety, and soon lose almost all likeness to the fertilised ovum. The former—the reproductive rudiments—are not implicated in the up-building of the 'body,' remain virtually unchanged, and continue the protoplasmic tradition unaltered so as to start a new organism on the same lines—i.e. with the same protoplasmic material. It is evident that a fertilised egg-cell with certain characters, *a*, *b*, *c*, will develop into an organism in which these characters *a*, *b*, *c* are variously expressed; but if at an early stage

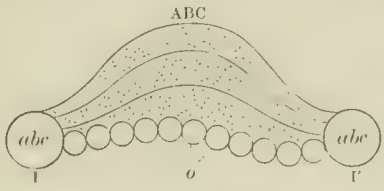


Fig. 1.

I, original ovum; ABC, body of organism to which it gives rise; *o*, chain of ovarian ova with properties *a*, *b*, *c* retained; I', liberated ovum of next generation, virtually equivalent to I.

certain cells are set apart, retaining the characters *a*, *b*, *c* in all their entirety, then these will be on the same footing as the original fertilised egg-cell, able like it to give rise to an organism, and necessarily to a similar organism. This explanation of heredity is at once so simple and so satisfactory that it becomes a most important question to determine how far the above facts are actually true among plants and animals. The answer is that they are as yet demonstrable only in a minority of cases. Thus, it is true that an early appearance or insulation of reproductive cells, materially continuous and presumably identical with the ovum itself, has been observed in some worm-types (leeches, Sagitta, thread-worms, Polyzoa), in some Arthropods (e.g. Moina among Crustaceans, Chironomus among Insects, Phalangidæ among Arachnids), and with less distinctness in a number of other organisms. But it must be distinctly allowed that in *most* cases it is only after development has progressed for some time that the future reproductive cells make their distinct appearance. Therefore, if distinct cellular continuity be only demonstrable in a minority, it becomes necessary to modify the generalisation. The required modification is due to Weismann, whose theory must be briefly stated. (1) A small portion of the effective substance of the fertilised egg-cell remains unchanged during the development, and serves as a foundation from which the germ-cells of the new organism are produced. (2) This important substance—the 'germ-plasma'—which keeps up continuity from one generation to another, is part of the nucleus, possesses an exceedingly complex minute structure, but has great stability, for it absorbs nourishment and grows enormously without the least change in its molecular constitution. (3) But while part of this special nuclear substance or germ-plasma of the egg-cell is reserved unchanged for the formation of the germ-cells of the resulting organism, part of it is changed into the nuclei of the ordinary body-cells, where, however, it sometimes retains enough of its original efficiency to be able to repair serious injuries or start the development of a new organism in *asexual* reproduction. Weismann has given a more complete expression to the fact of the continuity of generations than has hitherto been proposed, but it cannot be denied that there is much that is entirely hypothetical about the 'germ-plasma' and its history. For thorough exposition, reference must be made to his translated papers, and for detailed criticism to works cited in the bibliography.

We may further notice an important work by H. de Vries (1889), which seeks to combine the fact of continuity with part of the theory of pangenesis. He maintains that every characteristic of the organism is represented by a special 'pangene,' and that the germ-cells contain samples of all. This pangenetic accumulation in the germ-cells is not, however, the result of contributions travelling from the various parts of the body, but is the result of a definite, more or less direct continuity between the germ-cells and the fertilised ovum which started the organism to which they belong.

Theories of Continuity.—It can hardly be doubted that in the more or less direct continuity between the successive sets of reproductive products lies the solution of the main problem of heredity. The germ-cells which give rise to offspring are unique in their continuity with those which gave rise to the parents and it is this continuity or the involved sameness of material which explains the production of like by like. In the simplest animals or Protozoa, organism A buds and hands on a fraction of its living matter to A1, which, being so really part and parcel of A, must grow up into a similar adult Protozoon. With higher animals the same holds true, though the continuity, as expressed in

Fig. 2.—The Relation between Reproductive Cells and the Body:

The continuous chain of dotted cells at first represents a succession of Protozoa; further on, it represents the ova from which the 'bodies' (undotted) are produced. At each generation a spermatozoon fertilising the liberated ovum is also indicated.

the figure, is less direct. At various levels of analysis suggestions have been made which attempt to render the fact of continuity more luminous. Thus, Professor Hering and Samuel Butler suggested about the same time a psychical aspect of hereditary continuity, according to which memory is regarded as a general function of organised matter, and the reproduction of parental likeness as due to an unconscious recollection of the past. Haeckel also emphasised the luminous metaphor of 'organic memory,' but sought to express this in terms of molecular motion. The invisible activity of the organic molecules he compares to a complex wave-motion, harmonious and persistent from generation to generation, though capable of incorporating the results of fresh experience. The periodic wave-motion of the molecules he describes characteristically as 'the perigenesis of the plastidules.' In metaphorical language, the molecules remember or persist in the rhythmic dance which they have learned. Most naturalists, however, have been content to express the continuity in terms of the cells or of the nuclei, or of yet smaller elements. Galton and Jäger, Brooks and Nussbaum, Hertwig and Herdman, Nägeli and Weismann, and others have all contributed to making the fact of continuity more precise. Hopeful also are the suggestions of Jäger, Berthold, Gautier, and Geddes, which make towards a *chemical* expression of the continuity between germ and germ. Within present limits it is impossible to criticise any of the above elaborations. Behind all the suggestions, whether of 'organic memory,' 'persistent wave-motion,' 'stable germ-plasma,' or 'constancy of chemical processes,'

there stands the great fact of the real continuity of generations.

The Problem of Reconstruction.—How is it that the germ-cell divides and redivides as it does, and how does the development of the embryo retain its architectural constancy? Part of the answer has just been given—because the germ is virtually continuous with, and made of the same stuff as, the parent germ; therefore it must behave in precisely similar fashion. The rest of the answer involves difficulties which cannot fairly be laid on the shoulders of students of heredity, but belong to that most intricate of problems, the mechanics of development. Referring to the article EMBRYOLOGY for notice of some of the pioneer investigators of this problem, we can do little more than reiterate the caution of Professor His: 'To think that "heredity" will build up organic beings without mechanical means is a piece of unscientific mysticism.' We must also protest against the careless diction which makes 'heredity' now into a 'principle' and again into a 'power,' which calls it sometimes a 'law' and next time a 'cause.'

Inheritance of Acquired Characters.—Changes or variations in an organism may be roughly referred to three origins: (*a*) they may be the results of external or environmental influence; (*b*) they may be the outcome of use and disuse, or of functional increase or decrease; or (*c*) they may be due to internal, constitutional, or germinal conditions, of which one of the most important is the mingling of two different kinds of living matter in the fertilisation of the egg-cell. It is granted by all that an individual plant or animal may exhibit these three kinds of variation—environmental, functional, and organismal; and it is also true that the majority of naturalists have till recently believed that an individual gain or loss from any of the above origins might be transmitted from parent to offspring. Now, however, there is a widespread scepticism as to the inheritance or transmission of any but organismal, congenital, or germinal variations. This scepticism, mainly emphasised by Weismann, and now prevalent among naturalists, is by no means novel. The editor, whoever he was, of Aristotle's *Historia Animalium* seems to have differed from his master as to the inheritance of injuries and the like. Kant also maintained the non-inheritance of extrinsic variations, and Blumenbach cautiously inclines to the same negative position. In more recent times, His expressed a strong conviction against the inheritance of acquired characters, and Pflüger is also among the sceptics. A few sentences from Galton (1875), whose far-sightedness has been insufficiently acknowledged, may be quoted. The inheritance of characters acquired during the lifetime of the parents 'includes much questionable evidence, usually difficult of verification. We might almost reserve our belief that the structural cells can react on the sexual elements at all, and we may be confident that at the most they do so in a very faint degree—in other words, that acquired modifications are barely, if at all, *inherited* in the correct sense of that word.' Weismann, however, has brought the discussion to a climax. He goes even further than Galton in scepticism as to the inheritance of acquired characters, for he denies that any such transmission occurs. This denial is in part justified by the absence of experimental evidence to the contrary, but it is also suggested by Weismann's theory of continuity. For if a portion of the germ-plasma of a fertilised ovum is preserved unchanged during development to form the rudiments of the reproductive cells of the new organism, and if the germ-plasma is as stable as Weismann makes out, then there is a strong probability that no variations produced in the body by use or disuse or by outside influences can be transmitted. For they could only be transmitted by affecting the germ-cells, and this is a possibility which Weismann denies. He makes, however, two admissions: (*a*) that the germ-plasma may be slightly modified by changes of nutrition and growth in the body, and (*b*) that external conditions such as climate may influence the germ-cells *along with*, though not exactly *through*, the body-cells. These admissions are of course different from the once prevalent opinion that changes in the body were able to affect the germ-cells, and thus become transmissible, though it may be questioned whether the two saving clauses which Weismann allows are not sufficient to damage seriously the stringency of the conclusion on which he insists throughout—that no acquired characters are transmissible.

If this conclusion be true, then the influences of function and environment on the body of an organism *affect the individual only*, not the species. They have therefore no evolutionary value; the source of variation and the origin of adaptations must be sought elsewhere. To Weismann the sole source of evolutionary change is the intermingling of germ-plasma which occurs in fertilisation, and the condition of progress is found in the action of natural selection on the germinal variations which thus arise. There are, however, evolutionists who regard species as the necessary results of persistent variation in some definite direction, 'according to the laws of organic growth,' 'according to the conditions of protoplasmic change,' 'according to the opposition between nutrition and reproduction,' and so on. Those who take this view, even if they admit Weismann's conclusion about acquired characters, will not find it necessary to lay the entire burden of progress on the shoulders of natural selection.

As Weismann's conclusion that acquired characters are not transmitted is one of vast importance both theoretically and practically, it is necessary to notice some of the counter arguments. (*a*) There are very numerous cases on record where the effects of mutilation are said to be inherited, but it must frankly be allowed that no case is known which is not open to serious objection. Circumcision has a very ancient origin, but its effects on the Jewish race are imperceptible; while the same is true of mutilations inflicted for many generations on domesticated animals. And even the numerous cases of tailless kittens produced from artificially curtailed cats have little cogency in face of the fact that tailless sports may also arise from normal parents. (*b*) Various pathologists have brought forward instances of what appeared to them to be the transmission of acquired disease, but their arguments, as in the case of Virchow's, have evidenced misunderstanding as to Weismann's real position. There is no doubt that many malformations and weaknesses appear through numerous generations, but there is no evidence that such variations were not to start with germinal. If so, Weismann of course admits their transmissibility. Colour-blindness has been known to occur in the males only of six successive generations, deaf-mutism for three, finger-malformations for six, and so with harelip and cleft-palate, and with tendencies to consumption, cancer, gout, rheumatism, bleeding, &c. But none of these prove the transmission of characters acquired by use or disuse, or impressed by the action of surroundings. (*c*) Various naturalists have brought forward what appear to them to be examples of the genuine transmission of individually acquired characters. Thus, Detmer and Hoffmann among botanists, and Eimer among zoologists, may be quoted. Even the title of Eimer's recent work, *The Origin of Species, on the Basis of the Inheritance of acquired Characters, according to the Laws of Organic Growth*, shows how far he is from giving up the case. It

must be confessed, however, that, in default of fresh experiments, cogent evidence to negative Weismann's scepticism is still awanting, though some suggestive arguments in support of the old-fashioned belief in the inheritance of acquired characters are forthcoming, especially perhaps in connection with instinct and the growth of intelligence. (*d*) Another mode of argument often adopted against Weismann's conclusion is to shift the ground to the study of evolution, and there to demonstrate steps of progress which seem to many inexplicable on Weismann's sole formula of natural selection acting on variations produced by the intermingling of male and female germ-plasmas in fertilisation. (*e*) Finally, it may be urged that the unity of the organism, the connectedness of its elements, the common medium of the blood, and other facts make it difficult to believe that the germ-plasma can live on in the reproductive organs, unchanged by any of the deep environmental and functional variations which sometimes modify the structure of the body. Those who seek to maintain the transmission of some acquired characters have obviously to submit their cases to all the stern criticism which Weismann's valuable work involves. But if such cases be proved, it need not, of course, lead to any departure from some form of the doctrine of continuity, on which Weismann has so well insisted, nor to a return to the supposition of travelling 'pangenes.' It does not affect the theory of continuity to admit that decisive variations produced by environment or function may send their roots deep into the system, penetrating through the body to the reproductive cells themselves. Such cases are confessedly at present dubious, but there is no *a priori* reason why the sex-cells should not share in the results of altered nutriment and waste products, and even become saturated or infected by the characteristic chemical results of environmental and functional variations.

Social Aspects.—All the important biological conclusions, such as that of germinal continuity, or the fact that the two parents contribute almost equal shares to the starting of the offspring, and also the scepticism about the transmission of acquired characters, have an obvious human interest. The first result enables us to realise that the germ is virtually as old as the parent, and that

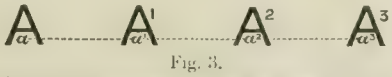

Fig. 3.

A A¹, the bodies of successive generations; *a*–*a*³, the germ-cells between which the real continuity obtains.

the main line of hereditary connection is not that between parent and child, but 'that between the sets of elements out of which the personal parents had been evolved, and the set out of which the personal child was evolved.' 'The main line,' Galton says, 'may be rudely likened to the chain of a necklace, and the personalities to pendants attached to the links.' To this fact social inertia is largely due, for the organic stability secured by germinal continuity hinders evolution by leaps and bounds, either forwards or backwards. That a good stock is pre-eminently valuable is an obvious truth. The fact that each parent contributes almost equally to the offspring emphasises the two-sided responsibility of parentage; but the fact has to be corrected by Galton's statistical conclusion that the offspring inherits a fourth from each parent, and a sixteenth from each grand-parent. Inherited capital is thus not merely dual, but multiple, like a mosaic. Again, if we believe with Weismann that no acquired characters are inherited, we are saved from the despair which the abnormal functions and environments of our civilisation are apt to suggest. But if the influences of function and environment do not readily become entailed or ingrained, we are all the more urged to practical action, which will secure improved conditions of life for each successive crop of individuals.

The fact that pathological conditions innate or congenital in an organism certainly tend to be transmitted suggests that popular opinion should be informed and educated as to undesirability of parentage on the part of abnormal members of the community. All congenital *malformations* and defects due to germinal faults tend to be transmitted, and the list includes not a few of evident practical importance, such as poverty of teeth, abnormal fingers, harelip and cleft-palate, and defective sense-organs. Still more important, however, are congenital or constitutional, as opposed to acquired, *diseases*. Certain forms of insanity and diseases of the nervous system and sense-organs, deaf-mutism, colour-blindness, gout, muscular weakness, unusual liability to certain contagious diseases, tendencies to consumption, cancer, and dipsomania, are illustrations from a long list of inheritable diseases or weaknesses. Some diseases are transmissible with greater probability than others—i.e. in a larger percentage of cases; some appear to take a firmer grip of the constitution, and may persist for many generations, while others are more readily counteracted or 'washed out' by hygienic régime or by intercrossing; some are transmitted along tolerably constant lines—e.g. father, daughter, grandson—i.e. in alternate sexes, or father, son, grandson—i.e. along similar sexes, while others are quite irregular in their occurrence. In reference to lines of transmission, Galton is inclined to conclude that 'the female influence is inferior to that of the male in conveying ability.' In the case of a disease like consumption, which decimates our British population, it ought to be noted that in about 50 per cent. of cases it is individually acquired, not inherited; that, as the disease is bacterial, only a consumptive *tendency* at most is transmitted; that, even when the phthisis 'runs in families,' its propagation is sometimes due to maternal or other infection; that environmental conditions, such as the nature of the soil, seriously affect its frequency; that, with care in regard to climate, surroundings, diet, exercise, &c., even children with a consumptive tendency may rejoin the healthy stock. None the less is it inadvisable that consumptives should be parents, least of all along with other consumptives. Allowing, again, for the undeniable influences of early nutrition, upbringing, and surroundings, all authorities admit that dipsomania or its results tend to be transmitted, often with the final consequence of extinguishing the family. Yet, in regard to the inheritance of pathological conditions, it ought to be noticed (*a*) that Virchow and others have hinted at an 'optimism of pathology,' since some of the less known abnormal variations may be associated with new beginnings not without promise of possible utility; (*b*) that, by the intercrossing of a tainted and a relatively pure stock, a recuperative or counteractive influence may act so as to produce comparatively healthy offspring, thus illustrating what may be called the 'forgiveness of nature.'

Social Inheritance.—The widest problems of heredity are raised when we substitute 'fraternities' for individuals, or make the transition to social inheritance. For lack of reliable statistics, and experts capable of wielding the statistical method, the complex problems of the relation between successive generations of a society have rarely been essayed. The most important pioneering is that of Galton, whose unique papers have been recently summed up in his *Natural Inheritance*

(1889), a work which, in its emphatic transition from the study of individuals to that of fraternities, well illustrates that science is indeed 'a social phenomenon.' Galton derived his data from his well-known *Records of Family Faculties*, especially concerning stature, eye-colour, and artistic powers; and his work has been in great part an application of the statistical law of Frequency of Error to the above-mentioned records. If we leave out of account the problem of estimating the share contributed to the offspring by each ancestor, and that of determining accurately the degrees of near kinship, the great problem of Galton's work relates to the curious regularity observed in the peculiarities of great populations during a long series of generations. 'The large do not always beget the large, nor the small the small; but yet the observed proportion between the large and the small, in each degree of size and in every quality, hardly varies from one generation to another.' In short, a specific average is sustained. This is not because each individual leaves his like behind him, for this is certainly not the case. It is rather due to the fact of a regular regression or deviation which brings the offspring of extraordinary parents in a definite ratio nearer the average of the stock. A few sentences must be quoted to explain this 'law of regression' which Galton has established. 'However paradoxical it may appear at first sight, it is theoretically a necessary fact, and one that is clearly confirmed by observation, that the stature of the adult offspring must on the whole be more mediocre than the stature of their parents—that is to say, more near to the median stature of the general population.' Or again, 'each peculiarity in a man is shared by his kinsmen, but *on the average* in a less degree. It is reduced to a definite fraction of its amount, quite independently of what its amount might be. The fraction differs in different orders of kinship, becoming smaller as they are more remote.' Yet it must not be supposed that the value of a good stock is denied or underestimated by Galton, for he shows how the offspring of two ordinary members of a gifted stock will not regress like the offspring of a couple equal in gifts to the former, but belonging to a poor stock, above the average of which they have risen. Yet it is true that the fact of regression tells against the full hereditary transmission of any signal talent. Children are not likely to differ from mediocrity so widely as their parents. 'The more bountifully a parent is gifted by nature, the more rare will be his good fortune if he begets a son who is as richly endowed as himself, and still more so if he has a son who is endowed more largely.' The other aspect of the case must not, however, be overlooked. 'The law,' Galton says, 'is even-handed; it levies an equal succession-tax on the transmission of badness as of goodness. If it discourages the extravagant hopes of a gifted parent that his children will inherit all his powers, it no less discountenances extravagant fears that they will inherit all his weakness and disease.'

The study of individual inheritance, as in Galton's *Hereditary Genius*, may tend to develop an aristocratic and justifiable pride of race when a gifted lineage is demonstrable for generations, or it may tend to absolute despair if the records of family disease be subjected to investigation. The study of social inheritance is at once more democratic and less pessimistic. The nation is a vast fraternity, with an average towards which the descendants of all nobles gradually tend, but to which the offspring of the under-average will also approximate. It seems a corollary that practical measures which beneficently affect large numbers are more hopeful than those which artificially select a few. It should be noticed also that, if Weismann's scepticism be thoroughly justified, it by no means leads us to depreciate the effect of work and surroundings, but emphatically increases the urgency of conserving healthful function and stimulating environments of every kind—all the more important if their influences must needs be repeated on each fresh generation. Nor should one forget how much a plastic physical and mental education (along with which M. Guyau includes hypnotic suggestion) may do to counteract disadvantageous inherited qualities, or augment those which are beneficial. Finally, it will be allowed that much requires to be done in educating public opinion, not only to recognise the results of the science of heredity, but also to admit the value and necessity of the corresponding art which Mr Galton calls 'eugenics.'

Hereford, the county town of Herefordshire, on the left bank of the Wye, 144 miles by rail WNW. of London, and 51 S. of Shrewsbury. Its noble cathedral was built between 1079 and 1535, and so exhibits every variety of style from Norman to Perpendicular. Measuring 342 feet by 146 across the transept, it has a central tower 165 feet high. It suffered much at Wyatt's hands after the fall of the western tower in 1786, but has been judiciously restored by Cottingham (1841–52) and Sir G. G. Scott (1856–63). Special features are the elaborate metal-work screen, the shrine of St Thomas de Cantilupe (1282), the organ (originally by Renatus Harris), and the 'Mappa Mundi,' or map of the world (*c.* 1314), a fac-simile of which was published in 1872. Hereford, with Gloucester and Worcester, is one of the meeting-places of the 'Three Choirs.' Other edifices are the Doric shire hall (1817), in front of it a statue (1864) of Sir G. C. Lewis; the corn exchange (1858), the episcopal palace (formed out of a Norman hall), the college of vicars choral (*c.* 1474), the 14th-century grammar-school, the half-timbered 'Old House,' the guildhall, the butchers' guildhall, the Coningsby Hospital (1610),

the free library (1876), &c. The Nelson column (1807) marks the site of the almost obliterated castle: and the White Cross, one mile out on the Hay road, commemorates the Black Death of 1347. Nell Gwynne and Garrick were natives. A large trade is done in agricultural produce; and the rose-gardens of Hereford are famous. The seat of a bishopric from 676, the city was chartered by Henry III., and returned two members to parliament—now only one—from Edward I.'s reign till 1885. It has stood many sieges from Stephen's time down to the Great Rebellion. Pop. (1851) 12,108; (1881) 19,822; (1891) 20,267. See works by Britton (1831) and Havergal (1869).

Herefordshire, an inland county in the west of England, is bounded on the N. by Shropshire, E. by Worcester, S. by Gloucester and Monmouth, and W. by South Wales. In length it measures 38 miles, in breadth 35, and its area is 833 sq. m. Pop. (1801) 89,191; (1871) 125,370; (1881) 121,062; (1891) 115,986. The surface is mostly hilly with occasional valleys opening into widespread plains, the chief hill-ranges being those of the Hatterell or Black Mountains (2631 feet) on the south-western, and the Malvern Hills (1395) on the eastern boundary of the county. It is watered by several streams, the principal of which are the Teme, and the Wye with its affluents the Lugg, the Arrow, and the Monnow, alike noted for their fishing, and the Wye in particular for its picturesque scenery. The climate of Herefordshire varies with the elevation and exposure, but, as attested by the general longevity of the inhabitants, is on the whole very healthy. The soil, which is for the most part a deep, heavy, red loam, with a substratum in many places of limestone, produces good crops of grain, principally wheat, and is favourable to the growth of timber. Hops are largely cultivated, and the area of the orchards with which the county abounds exceeds 27,000 acres. Herefordshire is celebrated for its cattle, and its horses and sheep are in a lesser degree well known. Cider-making is the principal manufacture, and malting is also carried on; whilst sandstone, limestone, and marble have been largely quarried. The county, divided into 11 hundreds and 258 parishes, returns three members to parliament, one for each of its two divisions (Leominster and Ross), and one for the city of Hereford. The county council numbers sixty-eight members. The principal towns are Hereford, Leominster, Ross, and Ledbury.

The historical events connected with the county are soon told. Its earliest inhabitants were the Silures, who for long withstood an invasion of the Romans, but, being at last (about 73 A.D.) overcome, they retired into the fastnesses of Wales. During the so-called Heptarchy it was incorporated with Mercia, and subsequently from its position on the Welsh border was—a portion of the county being included in the debateable land called 'the Marches'—the scene of prolonged contests between the rival claimants. In 793 A.D. Ethelbert, king of the East Angles, was treacherously murdered at Sutton, near Hereford; and in 1461 at Mortimer's Cross, 4 miles north-west of Leominster, the decisive battle took place between the houses of York and Lancaster which resulted in the defeat of the latter and the establishment of Edward IV. on the throne of England. Subsequently Herefordshire suffered much during the civil broils in the time of Charles II. Of places of interest in the county mention may be made of Offa's Dyke (q.v.); of Dorstone, where there is a large and curious cromlech known as 'Arthur's Stone;' of the ruins of Clifford Castle, the birthplace of 'Fair Rosamond,' Henry II.'s mistress; and of the Hereford Beacon on the Malvern Hills, on which is a camp, the construction of which is ascribed to Caractacus. Robert Devereux, Earl of Essex (Queen Elizabeth's favourite); Richard Whittington, 'thrice Lord Mayor of London;' David Garrick, the actor; John Kyrle ('The Man of Ross'); and Nell Gwynne, the favourite of Charles II., were all natives of Herefordshire; and Mrs Browning, the poetess, passed her childhood there. See the *Quarterly Review* for 1879, and works there cited. For the Earls of Hereford, see BOHUN.

Herencia, a town of Spain, 40 miles NE. of Ciudad Real, carries on manufactures of soap. Pop. 6000.

Hereros. See DAMARALAND.

Heresy (Gr. *hairesis*) primitively means a *choice* or *election,* and in its application to religious belief is used to designate as well the act of choosing for one's self, and maintaining opinions contrary to the authorised teaching of the religious community to which one's obedience is due, as also the heterodox opinions thus adopted and the party which may have adopted them. In the Acts of the Apostles (see v. 17, xv. 5, xxiv. 5, xxviii. 22) the word seems to be used of a sect or party, apart from the consideration of its character, whether good or bad; but in the Epistles and in the early Christian writers it is almost invariably used in a bad sense, which is the sense uniformly accepted in all subsequent theological literature. Roman Catholic writers, regarding the authority of their own church as supreme and final, apply the name of heresy to any formal denial of a doctrine proposed by the Roman Catholic Church as necessary to be believed. Protestant writers seldom use the word, except in relation to what each sect regards as the essentials of Christian faith.

Even in the apostolic times heresies had arisen in the church, and before the Council of Nice the catalogue of sects had already swelled to considerable dimensions. The chief early heresies are reducible to two classes: (1) those which attempted to associate the Christian doctrines with Judaism; (2) those which ingrafted Christianity upon the Gentile religions or the Gentile philosophies.

From the very date of the establishment of Christianity in the Roman empire heresy appears to have been regarded as a crime cognisable by the civil law; and Constantine enacted several severe laws for its repression, which were continued and extended by his successors, and were collected into a single title, *De Hæreticis,* in the Justinian code. The penalties of heresy ordained by these enactments are very severe, extending to corporal punishment, and even to death; and they all proceed on the distinct assumption that a crime against religion is a crime against the state. These enactments of the Roman law were embodied in the various codes of the European kingdoms; in English law heresy consisted in holding opinions contrary to Catholic faith and the determination of Holy Church. By common law the offender was to be tried in the provincial synod by the archbishop and his council, and, after conviction, was to be given up to the king to be dealt with at his pleasure. But the statute 2 Hen. IV. chap. 15 (*De hæretico comburendo*) empowered the diocesan to take cognisance of heresy, and, on conviction, to hand over the criminal directly, and without waiting for the king's writ, to the sheriff or other competent officer. This statute continued practically in force, with certain modifications, till the 29 Charles II. chap. 9, since which time heresy is left entirely to the cognisance of the ecclesiastical courts. The article BLASPHEMY deals with an important cognate subject.

In the case of clergy of the Church of England, under a statute of 1571 (now confined to its narrowest effect by a series of judgments) any distinct contradiction of the Articles, or obvious evasion of

them, subjects the offender to deprivation of his benefice. The supreme authority is the Judicial Committee of the Privy council, which construes the articles and formularies according to the legal rules for the interpretation of statutes (see ECCLESIASTICAL COURTS; and ENGLAND, CHURCH OF). In the Presbyterian churches a heretical minister is usually tried by his presbytery, and may be deposed from the ministry by the General Assembly.

For the history and literature of heretical sects, consult the very numerous articles in this work on the various bodies of heretics, as ALBIGENSES, ARIUS, ELIONITES, ESSENES, GNOSTICS, MANICHEANS, MONTANUS, MYSTICS, PELAGIUS, &c. See also the articles BAUR, CHURCH HISTORY, DOMINICANS, EXCOMMUNICATION, INQUISITION, PERSECUTION; the standard ecclesiastical historians; Arnold's *Kirchen- und Ketzer-Historie* (1699); Hahn's *Ketzer im Mittelalter* (1850); and Hilgenfeld's *Ketzergeschichte des Urchristenthums* (1884).

Hereward, commonly called HEREWARD THE WAKE, was an English yeoman or squire who held the Isle of Ely against William the Conqueror in 1070–71. When William had succeeded in encompassing the English patriots and penetrating to their camp of refuge, Hereward, scorning to yield, cut his way through to the fastnesses of the swampy fens northwards. It is probable that he subsequently became reconciled to William. He held property in Warwickshire and probably also in Worcestershire. The noble lineage assigned to Hereward in Charles Kingsley's romance of *Hereward the Wake* (1866) has been shown by Freeman (*Norman Conquest*, vol. iv.) to be destitute of historic foundation.

Herford, a town in the Prussian province of Westphalia, situated close to the frontier of Lippe-Detmold, 59 miles SW. of Hanover by rail. Flax and cotton spinning, linen weaving, and the manufacture of sugar and confections are carried on. Pop. (1875) 12,012; (1885) 15,902; (1895) 21,535.

Hergest, THE RED BOOK OF, the name usually given to a great manuscript, the chief repository of Welsh literature, now preserved in the library of Jesus College, Oxford. It owes its name to Hergest Court, a seat of the Vaughans, for whom most likely it was originally compiled. It is a folio volume of 360 vellum leaves written in double columns, from the beginning of the 14th to the middle of the 15th century. Its eleven prose tales were printed by Lady Charlotte Guest, together with the romance of the *Hanes Taliessin*, under the name of *Mabinogion*, although in the Red Book itself that name is applied to four only.

Heriot, in English law, is a kind of fine due to the lord of a manor on the death of a person holding land of the manor, and consists of the best beast, jewel, or chattel that belonged to the deceased. The lord can enforce this right by action, or seize it *brevi manu*. Heriots probably originated in the return of the horse and arms lent by a feudal lord to his tenant; they are now seldom paid in respect of freehold lands, and they are regarded as one of the most vexatious incidents of copyhold tenure. See COPYHOLD.

Heriot, GEORGE, founder of a magnificent school at Edinburgh, was a descendant of the Heriots of Trabroun, East Lothian, and was born at Edinburgh in June 1563. Commencing business as a goldsmith in that city in 1586, he was, after being eleven years in business, appointed goldsmith to Anne of Denmark, consort of James VI. of Scotland, and soon after to the king. On James's accession, in 1603, to the English throne, Heriot went to London, where, as court-jeweller and banker, he amassed considerable riches. He died at London, February 12, 1624, without issue, and bequeathed the residue of his property, amounting to £23,625, to found and endow a hospital (or school) in Edinburgh for the maintenance and education of the sons of poor deceased or decayed burgesses. Heriot's Hospital was completed from a design, it is believed, by Inigo Jones, in 1659. In 1837 an act of parliament was procured for expending surplus funds which had accumulated in the hands of the trustees in the erection of free schools for poor children (ultimately sixteen in all). The Act of 1885, at which time the annual revenue of the trust amounted to £26,502, reconstituted the hospital as a middle-class and technical school, and closed the free schools in the city. The Heriot-Watt College was also subsidised from the Heriot funds, to provide for older students thorough scientific and technical instruction at moderate fees. Besides, there are valuable bursaries awarded for the promotion of secondary and higher education, tenable at George Heriot's Hospital School, the High School, the Heriot-Watt College, and the university. And a sum is expended in providing free education, books, &c. for poor children attending public or state-aided schools. The revenue is now about £35,000, and it is estimated that it will ultimately increase to little short of £50,000. 'Jingling Geordie' figures in Scott's *Fortunes of Nigel*. See *History of Heriot's Hospital*, by W. Steven (new ed. 1859).

Herisau, the largest town of the Swiss canton of Appenzell, in the Ausser Roden division, stands 2549 feet above sea-level, 5½ miles SW. of St Gall by rail. It is a thriving seat of the cotton manufactures. Pop. 11,082.

Heristal, or HERSTAL, an industrial town of Belgium, on the Meuse, immediately NE. of Liége, of which it is virtually a suburb. It is mostly inhabited by workmen, who find employment in the coal-mines and the iron and steel works. Ruins still exist of the castle of Heristal, the birthplace of Pepin, the mayor of the palace; and his great-grandson Charlemagne frequently resided here. Pop. 11,918.

Heritable and Movable, a Scotch law-phrase denoting the distinction of things which go to the heir and to the executors respectively. Movables include such property as passes to the executor in succession, or is removable by the tenant on leaving his farm, or as comes under the operation of the law of the owner's domicile in bankruptcy and succession. Money and household furniture may be taken as examples. Heritable subjects are such as go to the heir in succession, or go with land to a buyer, and are regulated by the territorial law. The best examples are land and houses. The gearing of engines and all machinery fixed to the floor are also heritable. The distinction corresponds to a certain extent to the phrase 'Heir and Executor' in England.

HERITABLE BOND, in Scotch law, is a personal bond for a sum of money, with a real right of annual rent payable out of land, and accompanied by a conveyance of the lands themselves in security. The usual deed is now a bond and disposition in security, corresponding to the English Mortgage (q.v.).

HERITABLE SECURITIES, the name given in the law of Scotland to what are called mortgages and charges on land in England. These were formerly distinguished into wadset, infeftment of annual rent, heritable bond, bond and disposition in security, and absolute disposition with back-bond, and also reserved burdens on land. By the constitution of a heritable security the debt secured becomes a burden on the land, entitling the creditor to appropriate the rents until the debt is paid. This right of the creditor remains entire against the land, no matter into whose hands it passes,

and without affecting or being affected by the feudal titles, which confer and transmit the radical right to the land. In Scotland the principal heritable security is now called the bond and disposition in security, which consists of an obligation to pay the debt, and a disposition to the creditor, by way of security till the debt is paid. The bond must be registered in the Register of Sasines to complete the creditor's title, and it is assignable to a third party. A power is always given to the creditor to sell the estate if the principal or interest is not paid, in which case the creditor must account for the surplus after paying himself his debt.

Heritable Jurisdictions, a remarkable class of jurisdictions held hereditarily from the crown in Scotland, and abolished in 1748. These jurisdictions amounted to upwards of a hundred in number, and consisted of sheriffships, stewartries, constabularies, but principally of regalities and bailieries, with some offices of distinction. One of the more important was the office of Lord Justice-general and the lordship of Argyll and the Isles, both belonging to the family of Argyll. In virtue of their hereditary rights, the possessors of these jurisdictions exercised an arbitrary power over vassals and others within the limits of their domain, and could punish them by fines, scourging, imprisonment, and even in some cases put them to death, without interference of the common law. As repugnant to social policy, and more particularly with the view of extinguishing the authority of Highland chiefs over their clans, these heritable jurisdictions were abolished; the possessors receiving payment for the assumed value of their rights. Argyll alone received £21,000 as an indemnity, and altogether there was paid by government £152,037, 12s. 2d. The abolition of these odious jurisdictions being followed by the appointment of sheriffs on a proper footing, this great legislative act marks an important era in the history of Scotland. See the Duke of Argyll's *Scotland as it was and as it is* (1887).

Heritor, in the law of Scotland, is the owner of land in a parish liable to public burdens. The heritors, collectively, have vested in them the fee of the church and churchyard; they repair the parish church and manse, or rebuild them where necessary, and before the Education Act (1872) elected the parish schoolmaster.

Her'komer, HUBERT, artist, was born at Waal, in Bavaria, in 1849, the son of a woodcarver who came to England in 1857. At the age of thirteen he gained a medal at the Southampton art school, and afterwards studied for a few months at Munich and South Kensington. In 1870 he settled in London, where, besides painting, he employed himself in preparing designs for the *Graphic*. He has since exhibited a large number of works in water-colour and oil, including figure-subjects and portraits. His best picture is 'The Last Muster' (1875), a picture of Chelsea pensioners in chapel. In 1879 he was elected A.R.A., and in 1885 Slade professor at Oxford, being re-elected in 1889; he is also an honorary member of the academies of Vienna and Berlin, and an officer (1889) of the Legion of Honour. He became R.A. in 1890. An engraver, wood-carver, playwright, and musician, he founded an art-school at Bushey (q.v.).

Herkulesbad (or *Mehadia*), a Hungarian watering place, 20 miles north of Orsova by rail; its eighteen warm springs, 'the waters of Hercules,' have been used since Roman times.

Herma. See HERMES, ALCIBIADES.

Hermandad, THE (Sp., 'brotherhood'), had its rise in an association of the principal cities of Castile against the nobles who in 1282, under Prince Sancho, rose against Alfonso X. When Sancho succeeded to the throne (1295) the league was more firmly organised throughout Castile and Leon, with the express object of resisting the tyranny and exactions of the crown-vassals and nobles. Ferdinand and Isabella, in order to curb the power of their feudatories, first favoured the association and ultimately (in 1485) gave it a legal status under the name of the Hermandad. It now constituted a confederation of the entire burgher class for police and judicial purposes, with local courts and an annual meeting of deputies from all the cities; and the sovereigns, adopting its members as a standing force to counterbalance the followers of the feudal lords, put themselves at the head of the association, placed it at the service of the city magistrates, and employed it both in quelling disturbances and in seizing confiscated properties. The introduction of a regular standing army enabled the crown to free itself from this dependence on the towns; and with the decay of the Hermandad disappeared the last vestige of popular freedom.

Hermann. See ARMINIUS.

Hermann, JOHANN GOTTFRIED JAKOB, a German classical scholar, was born at Leipzig, 28th November 1772. He studied there and at Jena, and was made in 1798 extra-ordinary professor of Philosophy at Leipzig; in 1803, ordinary professor of Eloquence; and in addition, in 1809, professor of Poetry. He died as senior of the university, 31st December 1848. The first department which he began to cultivate on original principles was the science of classical metre, of which he attempted to develop a philosophical theory, based upon the categories of Kant; on this subject he wrote, besides his *Handbuch der Metrik* (1798), several Latin treatises, among which the *Epitome Doctrinæ Metricæ* (1818) reached a fourth edition in 1869. Of wider importance, however, was the new method which he introduced into the treatment of Greek grammar, and which has had its influence on the grammar of Latin and of German. The principles of this method are explicitly developed in *De Emendanda Ratione Græcæ Grammaticæ* (1801), and are practically illustrated in his numerous excellent editions of the ancient classics. Hermann's power of dealing with chronological, topographical, and personal questions is shown in his *Opuscula* (8 vols. 1827–77), which also contain some poems breathing the spirit of Roman poetry. See Memoirs by Jahn (1849) and Köchly (1874).

Hermannstadt (Lat. *Cibinium*, Hung. *Nagy Szeben*), a town of Hungary, formerly capital of Transylvania, is situated at the terminus of a branch-line (28 miles long), 370 miles SE. of Pesth. It consists of an upper and a lower town, the walls, towers, and bastions formerly surrounding which have only recently been demolished. Hermannstadt is the seat of a Greek archbishop and of a 'Saxon university. The fine Bruckenthal palace contains a picture-gallery, numismatic, antiquarian, and mineral collections, and a library of some 30,000 volumes. Tanning, wax-bleaching, and the making of cloth, paper, candles, sugar, and hats are carried on. Pop. (1891) 21,465, of whom 15,000 are Germans. Hermannstadt was originally the seat of a German colony, founded in the reign of Gesa II. (1141–61), and was at first called *Villa Hermanni*. It has endured several sieges from the Turks (1438 and 1442), as well as one from the followers of John Zapolya (1526). It also suffered at the hands of Gabriel Bathori in 1610, and again from both combatants during the Russo-Hungarian war of 1849.

Hermaphroditism, the combination of the essential male and female functions and structures

in one organism, as in most flowering plants, or in many lower animals, such as earthworm, leech, or snail. The name is derived from the fable of the union into one of the bodies of Hermaphroditus, son of Hermes and Aphrodite, and the nymph Salmacis—see Ovid's *Metamorphoses*, iv. 347. The combination of two sexes in one occurs, however, in various degrees, the bisexuality being sometimes very intimate, and in other cases only superficial. (*a*) It is probable that many animals—e.g. frogs, which are unisexual in adult life—pass through a period of *embryonic* hermaphroditism, early nutrition having much to do with the more or less complete predominance of one sex over the other. (*b*) Among fishes and amphibians and elsewhere, *casual or abnormal* hermaphroditism is not infrequent, the animal having for instance an ovary on one side and a testis on the other. (*c*) In other cases only one organ is developed, and one sex emphatically predominates in the organism, not, however, without hints of the other. This *partial* hermaphroditism is usually an exception, as when a butterfly has its wings coloured like those of the female on one side, like those of the male on the other. Frogs and toads also illustrate curious combinations, which do not, however, conflict with the predominance of the egg-producing or the sperm-producing function as the case may be. (*d*) An apparent, but in reality *false* hermaphroditism may result in the higher animals where, by malformation or rudimentary development of the external reproductive organs, a mammal in reality quite female may look like a male, or *vice versâ*.

(*a*) *Normal adult hermaphroditism*, where egg-producing and sperm-producing functions go on (usually at different times), is rare among higher animals—occurring in Chryophrys and Serranus among fishes, in the hagfish Myxine, and in all the Tunicata. It is, however, of frequent occurrence in the invertebrate series—among snails, bivalves, cirripedes, worm-types, cœlenterates, and sponges. It is most familiar in our common flowering plants, which are often called *monoclinous* or *perfect*.

Hermaphroditism may be more or less intimate. Thus, as an entire plant an Arum is hermaphrodite, with female flowers below and male flowers above; but the hermaphroditism is more intimate in a buttercup, where each flower bears male and female organs, or yet more intimate in an orchid, where stamens and carpels are united. So a leech, with ovaries quite distinct from the testes, is less intimately hermaphrodite than a snail, where within the same small organ both kinds of sex elements are produced.

The male and female elements, whether in phanerogam or invertebrate, are rarely, if ever, matured at the same time. Such a 'want of time-keeping' is called in botanical language dichogamy, and is one of the conditions which tend to prevent self-fertilisation. Protandrous dichogamy, where the stamens take the lead, is much commoner than protogynous dichogamy, where the carpels mature first. This is also true of animals, and is more marked when the hermaphroditism is intimate, as in snail or oyster. The hagfish seems to be predominantly male till it attains a certain size; and so in the curious thread-worm Angiostomum and in the crustacean Cymothoidæ the organs are first male and then after a while female. In the cirripeds and Myzostomata, the majority of which are bisexual, pigmy or complemental males are in some cases associated with the hermaphrodites, or in the case of the barnacles (in which separate sexes sometimes occur) even with some of the females.

Alike in plants and in animals, though hermaphroditism is common, self-fertilisation is rare. It does occur in not a few common flowers, and in tapeworms, some flukes, and a few other animals, but is without doubt exceptional.

Hermaphroditism is commonest in sluggish animals (e.g. flat-worms, tardigrades, snails), or in fixed animals (e.g. sponges, corals, Polyzoa, bivalves, Tunicates), or in parasitic animals with a plethora of nutrition and little exertion (e.g. flukes, tapeworms, leeches, Myzostomata).

As to its origin, hermaphroditism is probably the lower, more primitive condition from which that of unisexuality has been in the majority of cases evolved. In alternating rhythms eggs and sperms were produced, gradually the areas of their respective formation were restricted, by-and-by one tendency predominated in the organism, and separate males and females were established. If embryonic hermaphroditism be, as some believe, of general occurrence, then most organisms recapitulate this evolution of separate sex in their individual life-history. If it be allowed that hermaphroditism was the primitive condition, then the cases now existing indicate either persistence or reversion. See EMBRYOLOGY, REPRODUCTION, SEX; and Geddes and Thomson, *The Evolution of Sex* (Lond. 1889). For aberrant hermaphroditism in human adults, see Todd and Bowman's *Cyclop. of Anat. and Physiol.*, vol. ii.

Hermas, as the author of the well-known early treatise called *The Shepherd*, is usually reckoned one of the Apostolic Fathers (q.v.). The work is quoted as inspired by Irenæus and Clement of Alexandria. To the Montanist Tertullian it is 'that apocryphal Shepherd of the adulterers;' but Eusebius, while he places it in his list of spurious or rejected books, witnesses that it had been read publicly in the churches. And indeed the 'commandments' were read here and there in the Eastern Church from the 4th to the 15th century, though nowhere with the honour of Scripture. The date and the authorship are both in dispute. The suggestion first advanced by Origen, in the 3d century, that the Hermas mentioned in Romans might be the author, may be dismissed in company with the assertion of the Ethiopic scribe that Hermas was none other than St Paul. The statement of the writer of the Muratorian Fragment has been generally accepted, that Hermas was the brother of Pius I., Bishop of Rome about the middle of the 2d century, and that he wrote during his brother's episcopate; but the form of church government that appears in *The Shepherd* is against this tradition, as perhaps is also the jealousy the writer displays of those who are ecclesiastically his superiors; and moreover the treatise was already in general use considerably before the end of the century. From these and other considerations there has been in recent years a tendency to throw the date back to the beginning of the 2d century, and to identify a certain Clement who is mentioned with Clement (q.v.) of Rome. This last point is a mere assumption, but in favour of the earlier date is most of the internal evidence, as well as the fact that the book was read in public—an honour restricted in every other instance to writings accepted as those of the Apostles or their immediate disciples; against it are the allusions to the persecutions suffered by the Christians, the condition of the Roman Church, and the absence of all reference to Judaising Christians. Finally, Donaldson's theory that the name Hermas is fictitious, and the whole work an allegory, appears to be based on a misconception. The treatise, which is divided into three parts—visions, commandments, and similitudes—contains little of positive dogmatic teaching, but is an interesting monument of early Christian thought; it was intended primarily

to rebuke the worldliness that had come upon the church, and to turn sinners to repentance.

Latin translations were in use before the end of the 2d century, and for long the work was known only through a score of MS. copies of one of these versions. A second Latin version has been discovered, however, as well as an Ethiopic version, found by D'Abbadie in 1847, and edited by him with a Latin translation (Leip. 1860). Of the Greek text the Codex Sinaiticus supplies about one-fourth, to nearly the end of the fourth commandment; the rest, except about seven short chapters, is in the Athos MS. Considerable portions are found in Pseudo-Athanasius and Antiochus Palæstinensis, who have borrowed extensively from Hermas without acknowledgment. In 1890 the discovery of a new Greek codex, contemporary with the Sinaiticus, and containing the whole of Hermas, was announced. There is a 'complete' Greek text by Hilgenfeld (1888), who has also edited the Latin form (1873); and a *Collation of the Athos Codex* has been made by Dr Spyr. P. Lambros (trans. with preface, &c., by F. A. Robinson, Camb. 1888). There is a good edition of Latin and Greek by Gebhardt and Harnack (1877). See also Zahn, *Der Hirt des Hermas* (1868); Donaldson, *The Apostolical Fathers* (1874); Salmon's *Introduction to the New Testament* (4th ed. 1889); and *Johns Hopkins University Circulars*, iii. 75 and iv. 23.

Hermeneutics. See EXEGESIS.

Hermes, on the testimony of art and literature alike, was more intimately connected with the everyday life of the Greeks than was any other of their gods. In the country his images were erected on mountains, in caves, by the side of streams, by the roadside, where they served as finger-posts, and on the marches, where they served to delimit the frontier. In towns the gate by which one entered the city and the door by which one entered a house were under the protection of an image of this deity. The streets of the city, like the roads of the country, were marked by statues of Hermes (Lat. *Hermæ*). Inside the house as well as outside its doors the likeness of Hermes was to be found. The agora or market-place of every city was especially under the protection of this deity, and possessed a statue of him. The gymnasium and palæstra also were decorated with likenesses of their patron god Hermes. Finally, in the very grave the Greek was accompanied by Hermes, the conductor of souls.

From what has been said it is obvious that the functions ascribed to Hermes, the son of Zeus and Maia, must have been very considerable in number and range. In the first place, he was regarded unanimously and from the beginning as the herald and messenger of Zeus, and in virtue of this character he is represented in art with the herald's staff, with wings on his feet or shoulders, and a traveller's hat of felt, low in the crown and broad in the brim, on his head. It seems natural in the next place to attribute Hermes' function as god of the training ground to the speed of foot which he as the herald of the gods was credited with. Again, Hermes was the patron of thieves, and he himself, according to the 'Hymn to Hermes,' commenced a thief's career by stealing the oxen of Apollo when he was but a few hours old. At the same early age, according to the same authority, Hermes invented the lyre, which he constructed out of the shell of a tortoise. The invention of the flute and the syrinx also was ascribed to this deity. The function of conducting the spirits of the departed to the next world, and the closely-related function of bringing dreams to mortals, probably were part of his duties as the messenger of the gods, but are of so much importance that they need separate mention. A function apparently quite unconnected with any already mentioned is that of securing fertility to flocks and herds, and generally of preserving health. We have already noticed that roads and streets in Greece were under the especial care of Hermes; we must then connect this fact with the circumstance that Hermes was the patron of travellers, merchants, and commerce generally. Finally, Hermes was the god of unexpected good-luck; what we call a godsend the Greeks called a Hermaion.

As to the origin of Hermes comparative mythologists are disagreed, though perhaps not more so in his case than in the case of other gods. He has been regarded as the god of fertilising rain, as the evening twilight or the light of dawn, as a cloud-god, as a nether-world god, and of course as a solar god. It is objected to these explanations that they only account for some and not for all of his functions. Thus, the fertilising rain would explain his function of causing fertility (were it not for the fact that it is the fertility of flocks and herds that Hermes is concerned with), and the pleasant sound of the falling rain might explain his connection with music. But the other functions find no explanation or but a forced one in this theory. It has been therefore argued (by Roscher, *Hermes der Windgott*) that Hermes is a wind-god. The wind is the divine messenger sent from Zeus (the sky) to man. The wind sweeps down from the mountain-tops, where again the images of Hermes were placed. The swiftness of the wind is indicated by the wings on the heels or the shoulders of the god. The winds carry things away, even as the thief Hermes. The wind, like Hermes the inventor of the flute and the lyre, makes sweet music. Ghosts that are but thin air, belong to the domain of the air, and are under the dominion of the wind-god. The gentle zephyrs not only favour the growth of plants, but, according to ancient notions, conduced to the fertility of flocks and herds. The winds also blow away foul air and miasma, and the wind-god is therefore properly the god of health. The changing wind has ever been the symbol of fickle fortune and unexpected luck, and Hermes is the god of unexpected good-fortune. Travellers are especially dependent on wind and weather, and hence on Hermes. Again, various epithets which are applied to this god and have caused much trouble to scholars can be explained on this theory. *Argeiphontes* is the god who makes the sky clear, as does the wind. *Diaktoros* is the chaser. The name Hermes itself, or rather the older form *Hermeias*, corresponds phonetically to the Sanskrit *Sarameyas*, and is derived from the root *sar*, 'to hasten,' whence comes the epithet *Saranju*, applied to the Hindu Maruts, gods of the storm-wind.

That this explanation of the origin and functions of Hermes explains everything cannot be denied. Whether it is the right explanation is another matter. Apart from the fact that there are not many things for which an analogy could not be found in the action of the wind, it may be doubted, as a matter of general principle, whether we ought to look for one idea from which to deduce all the functions of a god. We may borrow an illustration from comparative syntax: no one would now think of trying to deduce all the meanings of the Greek genitive from one single central idea. In the first place, the Greek genitive conceals beneath it several cases (just as the Greek Heracles conceals several different local heroes), such as the ablative, the instrumental, &c.; and, in the next place, even the uses of the genitive proper were not as a matter of history all evolved out of one nebulous use equidistant from all subsequent uses. The extension of the meaning of a case, like the extension of the meaning of a word, is due to analogy, to its application to expressions new but analogous to those in which it was first employed. The same principle of extension by 'contiguity,' as logicians call it, in all probability explains the heterogeneous functions ascribed to any one particular god.

To seek for some notion common to them all may be as mistaken a proceeding as it would be to seek to derive the idea of the grave and the idea of horse-racing from some idea equidistant between the two, because 'the turf' bears both meanings.

Finally, the beauty which characterises the statue of Hermes in the zenith of Greek art (the so-called Antinous of the Belvedere) is a Hermes) naturally belongs to the patron god of the gymnasium and the palæstra, while the celebrated statue of Hermes by Praxiteles portrays the god of the principle of fertility, in whose care all young things were, and to whom therefore it fell to tend his young brother Dionysus. For Hermes Trismegistus, see HERMETIC BOOKS.

Hermes, GEORG, a Roman Catholic philosopher and divine, was born at Dreyerwalde, in Westphalia, April 22, 1775. He studied at Munster, became theological professor there in 1807, and in 1819 at Bonn. At Bonn he died, May 26, 1831. In his chief works, *Die Innere Wahrheit des Christenthums* (1805), *Philosophische Einleitung in die Christ-Katholische Theologie* (1819), and *Christ-Katholische Dogmatik*, he sought to base the Catholic faith and doctrines on a critical theory of knowledge like Kant's. The Hermesian method of investigation in like manner discards, in the first stages, and so far as investigation is permitted to extend, all principle of authority; and in the details of metaphysical inquiry, in the selection of the arguments of the existence of God, and of the nature of divine attributes, he departed widely from the old text-books of the schools; although in the general sum of the doctrines of the Roman Catholic Church his orthodoxy does not appear to have been in any degree called into question. Soon many theological and philosophical chairs were filled by *Hermesians;* and it was not till after the death of Hermes that his doctrines were condemned by the pope (1835), and some professors deprived of their chairs. The controversy was continued, as well in Rome as in Germany, for a considerable time; by degrees, however, the Hermesian party fell away. See works on Hermes and his movement by Esser (1832), Elvenich (1836), Niedner (1839), and Stupp (1845).

Hermetic Books, the sacred canon of the ancient Egyptians, consisted of forty-two books, divided into six sections. They constitute what is virtually an encyclopædia of Egyptian wisdom, in that they treat of religion, the arts, and science—the nature of the gods, laws, liturgical rites and ceremonies, hymns, hieroglyphics, geometry, astronomy, medicine, and cosmography. The name 'hermetic' comes from Hermes Trismegistus ('Hermes Thrice-greatest'), the Greek name of the Egyptian god Thoth, who was regarded as the originator of Egyptian culture, the god of writing, of religion, and of the arts and sciences. Neither the time at which these books were actually written, nor the author or authors who wrote them, can now be determined. They are evidently based upon the Egyptian mythology, but at a time when it was beginning to feel the influence of Hellenistic culture, since traces of Neoplatonist ideas can be discerned in them, as also indications of the influence of the Jewish philosopher Philo. The Greek and Latin texts of the hermetic books exist, but only fragmentarily, in the writings of such writers as Stobæus, Cyrillus, Suidas, and Lactantius. The greater part of these pieces have been published by Parthey (*Hermetis Trismegisti Pœmander*, 1854), and again by Ménard (*Hermès Trismégiste*, 1866). The *Papyrus Ebers* (1875) is generally accepted as being one of the medical books of the series. The teachings of Thoth were at first regarded as esoteric doctrines, and as such jealously guarded by the sages and from them transmitted to their pupils, these depositions of the sacred lore making what was called the *hermetic chain*. Thoth was also the inventor of magic and alchemy, whence the latter was sometimes called the *hermetic art*, and whence are derived the terms *hermetic medicine*, *hermetic freemasonry*, and *hermetically sealed*, this last to signify the closing of a box or jar or other receptacle in such a way as to exclude absolutely the atmosphere.

Hermit (Gr. *eremitēs*), a name given in the early ages, and still more in the later church, to a solitary ascetic, who, with a view to more complete freedom from the cares, temptations, and business of the world, took up his abode in a natural cavern or a rudely formed hut in a desert, forest, mountain, or other solitary place. In the first centuries the names of eremite and anchorite (Gr. *anachōrētēs* = 'one who retires'—i.e. from the world) were indiscriminately applied to these solitaries; but, the word *eremita* having been adopted into Latin, 'hermit' is more commonly used in the modern languages which are derived from that tongue. Hermits began to appear in the Christian church in the 3d century. The advocates of Asceticism (q.v.) were the first to set the example of retiring from cities to rural districts and villages. But the hermits went further, and sought to withdraw altogether from mankind, that they might give themselves up to a life of solitary but holy contemplation. The earliest hermit is said to have been Paul of the Thebaid (Egypt), who during the Decian persecution fled for safety to the desert (250); there he lived for the rest of his life, dying, 113 years old, about 342. The fame of his sanctity quickly incited others to imitate his mode of life. The most famous amongst these successors was St Anthony (q.v.). At the time of his death (365) hermit cells existed in considerable numbers in the deserts of Egypt, Syria, and Palestine. But the hermits were not always able to preserve their solitude unbroken. The fame of their sanctity drew many to visit them, partly out of curiosity, partly to enjoy pious converse with them, or to get religious advice from them, partly also in the belief that diseases, particularly mental diseases, were cured by their blessing. Sometimes they returned for a short time to the midst of their fellow-men to deliver warnings, instruction, or encouragement, and were received as if they had been inspired prophets or angels from heaven. The Stylites (q.v.) or pillar-hermits, who spent their lives on the tops of columns, and similar eccentric beings, were a base caricature of the true hermit, men in whom the good spirit of asceticism had become perverted by exaggerated fancy or pride or passion. But the number of hermits gradually diminished as the cœnobite life of convents grew into fashion. Indeed the institution at no time secured the same footing in the Western Church that it did in the Eastern; and perhaps the reason may in part be found in the difference of climate, which renders a manner of life impossible in most parts of Europe that could be pursued for many years in Egypt or Syria. Partial revivals of the practice continued to be made, however, during some centuries, St Cuthbert (q.v.) being a case in point. The name hermit was in still later ages applied to those eccentric individuals who separated themselves from their fellow-men to live in caves or solitary huts, not from any religious motives, but from a morbid aversion to human society or an inordinate love of solitude. See MONACHISM, and Charles Kingsley's *Hermits* (1869).

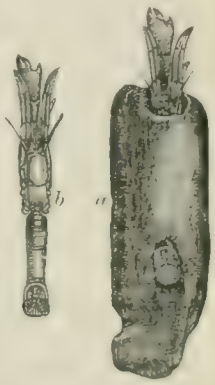
Hermitage. See WINE.

Hermit-crab, a name applied to the members of a family of crustaceans (Paguridæ), notable for their habit of sheltering themselves in gasteropod shells, and for the soft skinned and generally unsymmetrical tail, probably in part the cause and in part the consequence of this curious custom. The eyes are borne on long stalks; the great claws are very large and generally unequal, one being used to close the entrance of the shell into which the hermit can wholly retract himself; the abdominal appendages are practically aborted, with the exception of those at the tip of the tail, which hold so firmly on to the spire of the inhabited shell that it is difficult to pull out the crab unbroken. There are a great many different kinds of hermit-crabs, and these utilise many forms of gasteropod shell, not always keeping constant to one type of house. The commonest species (*Pagurus* or *Eupagurus bernhardus*) is usually found tenanting the shells of the whelk (Buccinum); while

Common Hermit-crab shifting from one whelk shell to another.

another very common species (*P.* or *E. prideauxii*) may be found inside shells of Fusus, Murex, Cancellaria, Turbo, Buccinum, &c., and is also very interesting as an illustration of partnership or Commensalism (q.v.) with a species of sea-anemone which forms a cloak round the shell. It masks the hermit-crab, and may also be useful on account of its stinging-cells, while the hermit-crab repays the anemone by carrying it about, and doubtless also with debris of food (for illustration, see Anemone). This habit of helpful partnership has been observed even in *Pagurus abyssorum* from a depth of 3000 fathoms. As hermit-crabs grow they have not only to cast their own armature in the usual crustacean fashion, but they must periodically shift to a successively larger and larger house. In looking out for a new shell to tenant hermit-crabs are naturally in a hurry, being then in a position of defencelessness unusual for them; and it has been observed that they do not always seek for an empty mollusc shell, but may evict the rightful owner of one which strikes their fancy. The common hermit-crabs feed on molluscs and animal debris. They are most interesting inmates of aquaria, but their voracity is very apt to reduce the population.

Some of the deep-sea hermit-crabs, brought up by the *Challenger*, *Blake*, and other explorations, are of much interest, especially perhaps inasmuch as several retain the symmetry which the more familiar forms tenanting spiral shells have lost. As such shells are rarities at the bottom of the deep sea, some of the hermits retain the doubtless original free life. Such is *Tylaspis anomala*, from the south Pacific at a depth of 2375 fathoms, which has a very much shortened abdomen, with distinct segments, however, and well-developed symmetrical appendages. From the West Indies the *Blake* obtained *Pylocheles agassizii*, living in straight tubes of compacted sand, and quite symmetrical. Even more interesting is the symmetrical *Xylopagurus rectus*, living at depths of 300 to 400 fathoms, in open tubes of wood or bamboo-stem, into which the animal retreats head foremost, and guards the opening with firm plates on the end of the tail.



Xylopagurus rectus in its case (*a*) and free (*b*).

The members of the genus Cœnobita, from the shores of the Indian Ocean and other warm seas, live in all sorts of houses, including the shells of marine gasteropods (Murex, Purpura, &c.), of landsnails, of sea-urchins, or even nuts. One species, *C. rugosa*, is famous for its fondness for cocoa-nuts, and for its excursions ashore. In another genus, the robber hermit-crab (*Birgus latro*), from the West Indies, lives in holes in the earth under trees, has an almost lung-like modification of the gill-cavity for breathing air directly, yet visits the sea periodically by night. It feeds on cocoa-nuts, though it does not climb for them, and is itself eaten in Amboyna and elsewhere. Darwin has graphically described how it tears the husk from the cocoa-nuts, and hammers on the round depressions at one end until entrance is effected. Out of a biscuit-box, the lid of which was fastened down with wire, a robber-crab made its escape, actually punching holes in the tin and turning down the edges.

See Commensalism, Crab, Crustacea; J. R. Henderson, *Challenger Report on Anomura*; Agassiz, *Voyage of the Blake*; Marshall, *Das Tierleben der Ostsee* (Leip. 1888); and Darwin, *Voyage of the Beagle* (Lond. 1845).

Hermodactyl. See Colchicum.

Hermon, Mount (now *Jebel es Sheikh*), 9150 feet high, is the culminating point of the Anti-Libanus range. See Lebanon.

Hermopolis Magna, an ancient town of Egypt, situated on the Nile, on the border of the Thebaid, and near the frontier line of upper and middle Egypt. Thanks to its position, Hermopolis grew to be a place of great importance, ranking next after Thebes. It had a celebrated temple sacred to Thoth, the ibis-headed god of letters, of which the portico alone is all that now remains. On the opposite or right bank of the Nile was Antinoöpolis, where the dead of Hermopolis were taken for burial. The modern name of Hermopolis is Ashmun or Eshmoon.

Hermosillo, capital of the Mexican state of Sonora, stands in a fertile plain on the Rio Sonora, 50 miles by rail N. of the port of Guaymas. It has a mint and other government buildings, a bank of issue, sawmills, distilleries, and shoe and furniture factories, and a large export trade in wheat and wine. Pop. 15,000.

Hermoupolis. See Syra.

Hermus, a river of Asia Minor, flowing through the plain of Sardis, and falling into the Gulf of Smyrna.

Herne Bay, a watering-place of Kent, 12 miles W. of Margate. Founded in 1830, it has a pier 1213 yards long, an esplanade 1 mile long, and a handsome clock-tower. Bishop Ridley was vicar of Herne in 1538–40. Pop. 2816.

Herne the Hunter, a figure in popular tradition, long supposed to range at midnight around an ancient oak in Windsor Forest. He is referred to in Shakespeare's *Merry Wives of Windsor*, and Herne's Oak continued to be an object of interest until it was blown down on 31st August 1863. The Queen planted a young oak on the spot where the patriarch had stood, as was supposed, for 650 years.

Hernia (Lat.; probably from Gr. *ernos*, 'a sprout'), in its widest sense, signifies a protrusion, through an abnormal or accidental opening, of any organ from its natural cavity. Although hernia may occur in many parts of the body, the word, used by itself, is restricted to signify protrusion of the abdominal viscera, the condition popularly called *rupture*.

The way in which hernia may arise will be readily understood if we bear in mind that the abdominal viscera are subject to constant pressure from the diaphragm and other surrounding muscles. If at any point the walls of the belly are not sufficiently strong to resist this pressure some portion of the viscera is driven through them, and a hernial tumour is formed. Certain parts of the abdominal walls, especially the inguinal and crural rings, and the umbilicus, being weaker than others, hernia most frequently occurs at these points. In some instances hernia is congenital, from abnormal deficiency of the walls; in other cases it may arise at any period of life as a result of violent bodily exertion. Sex, age, and occupation seem to have a marked influence in predisposing to hernia. Men are far more liable (in about the proportion of four to one) to this disease than women; though they are less so to those forms of the affection known as femoral and umbilical hernia. According to Malgaigne, in France one man in thirteen, and one woman in fifty-two, are the subjects of hernia. In respect of age he found that the liability is least about the age of thirteen (one in seventy-seven), after which it progressively increases until the close of life, rising at seventy to seventy-five to one out of every three.

A hernia is almost always composed of *a sac* and *its contents*. The sac is a portion of the Peritoneum (q.v.) corresponding to the aperture at which the hernia protrudes. It is pushed forward by the protruding viscera, and forms a pouch. The contents vary greatly, but generally consist of a portion of the small intestine (particularly of the ileum), forming the variety of hernia known as *enterocele*. Omentum is often found in hernial sacs, either with or without intestine. Besides the viscera, the sac always contains a certain quantity of fluid secreted by its interior. Hernia is divisible (1) into *reducible*, or returnable into the abdomen, *irreducible*, and *strangulated;* and (2), according to its situation, into *inguinal*, *femoral*, &c.

The treatment of reducible hernia may be palliative or radical. The palliative treatment consists in the application of a truss (see below) to retain the protrusion within the cavity of the abdomen. Each particular kind of hernia (femoral, umbilical, &c.) requires its special form of truss; and before applying it the hernia must be reduced by placing the patient on his back, relaxing the muscles by bending the thigh upon the abdomen, and pressing the tumour back in the proper direction. The truss should then be put on, and should be worn during the whole of the day; and if the patient will submit to wear it (or a lighter one) during the night, so much the better. The means that have been contrived to effect a radical cure are too purely surgical for description in these pages. Below the age of puberty, and if the hernia is recent, a radical cure is sometimes effected by wearing the truss for two or three years.

In irreducible hernia the protruded viscera cannot be returned into the abdomen, but there is no impediment to the passage of their contents or to their circulation. In these cases the patient is often liable to dragging pains in the abdomen, and to attacks of vomiting, in consequence of the movements of the abdominal organs being checked by the omentum or intestines being fixed. There is also constant danger of this hernia passing into the strangulated form. The treatment may be either palliative or radical. The palliative treatment consists in the employment of a truss with a hollow pad that shall embrace the hernia, and prevent any additional protrusion. An irreducible hernia may *sometimes* be converted into a reducible one by keeping the patient in the recumbent position, and on very low diet, for two or three months; at the same time keeping the bowels open by laxatives and injections, and maintaining equable pressure over the tumour. Radical cure is, as in the case of reducible hernia, by operation.

Hernia is said to be strangulated when a portion of intestine or omentum that is protruded is so tightly constricted that it not only cannot be returned into the abdomen, but has its circulation arrested. This form is highly dangerous, because, if relief is not speedily afforded, the strangulated part becomes gangrenous. The causes of strangulation are various, but this condition most commonly arises from a sudden violent effort, by which a fresh portion of intestine is driven into a pre-existing hernia, which it distends to such a degree as to produce this complication. The most prominent early symptoms are flatulence, colic pains, &c. They are succeeded by vomiting first of the contents of the stomach, then of mucus and bile, and lastly of fæcal matters, owing to inverted peristaltic action. If relief is not obtained the inflammation that commences in the sac extends to the peritoneum, and the ordinary signs of peritonitis appear. After a variable time comes gangrene or mortification of the part, and the patient speedily sinks.

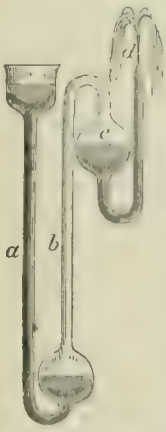
The surgeon first tries to return the intestine, as in the preceding cases. This manipulation, termed the taxis, may be assisted by the internal use of chloroform, inhaled till it produces complete relaxation of the muscles, by the hot bath, &c. If this fails he must have recourse to the knife to divide the constriction.

The necessity of having recourse to a suitable truss the moment that the slightest protrusion shows itself in any of the parts liable to hernia cannot be too strongly urged as a matter of necessary general knowledge. At whatever period of life a hernia occurs, if properly attended to and judiciously supported, it usually gives little trouble, and if it occurs in early life, it may often be cured; whereas, if it be neglected, increase of bulk, and, subsequently, diseased states of the parts, often terminating in death, will almost certainly occur. A *truss* consists essentially of a pad or cushion attached to a metallic spring, with straps so arranged that its position may be retained during the varied postures of the body. A surgeon should always be consulted in the choice of the instrument. 'The practice,' says Mr Birkett, 'of leaving cases of rupture in the hands of mere tradesmen cannot be too strongly censured. Amongst the poor we constantly observe the lamentable effects of this proceeding.' Many varieties of trusses have been invented. There are occasional

cases in which the common truss fails to support a rupture comfortably, and in these cases various instruments, for the most part the property of special instrument-makers, are often serviceable. The patient must expect to find the truss somewhat uncomfortable for a week or two, but will soon get used to it. The skin of the part upon which it presses should be regularly washed and bathed with eau de Cologne or spirit, as, without this precaution, boils are apt to form on it.

Hero, a priestess of Aphrodite, who loved and was beloved by a beautiful youth named Leander, whose home was at Abydos, on the opposite shore of the Hellespont. Hero's position as a priestess, and the will of her parents, were obstacles to their union, but Leander every night swam across the Hellespont to visit his beloved, directing his course by a lamp that burned on the top of a tower on the seashore. But one tempestuous night the light was extinguished, and Leander was drowned. Hero, when she saw his dead body washed ashore at daybreak, threw herself down from the tower into the sea and perished. A poem on this theme has come down to us under the name of Musæus; the romantic story is alluded to by Ovid, Virgil, and Statius; and in modern times Marlowe, Schiller, and Leigh Hunt have retold it in verse, whilst Grillparzer has made it the subject of a drama.

Hero OF ALEXANDRIA (Gr. *Herōn*), a great mathematician and natural philosopher, was a pupil of Ctesibius, and flourished about 100 or 150 B.C. He seems to have invented a great number of machines and automata, among which are Hero's fountain; a steam-engine on the same principle as Barker's mill; a double forcing-pump used for a fire-engine, and various other similar applications of air and steam. Among his works which have come down to us the most notable is on Pneumatics; Hultsch edited the remaining fragments of his geometrical works in 1864.—Another Hero, called Hero the Younger, who wrote on mechanics and astronomy, long had the credit of writing some of his namesake's books. According to some authorities he flourished at Alexandria in the 7th century A.D.; according to others, at Constantinople in the 10th.—HERO'S FOUNTAIN is a pneumatic apparatus, through which a jet of water is supported by condensed air. A simple mode of constructing it by means of glass tubes and a glass-blower's lamp is shown in the annexed figure. The column of water in the tube *a* compresses the air in *b*; this presses on the surface of the water in *c*, and causes it to gush out at *d*.



Hero's Fountain.

Herod, the name of a family which rose to power in Judæa during the period which immediately preceded the complete destruction of the Jewish nationality. The family was of Idumean descent; but, though alien in blood, was Jewish in religion, the Idumeans having been conquered and converted to Judaism by John Hyrcanus, 130 B.C. (1) HEROD THE GREAT was the second son of Antipater, who was appointed procurator of Judæa by Julius Cæsar, 47 B.C. At the time of his father's elevation Herod, though only fifteen years of age, was made governor of Galilee, and afterwards of Cœle-Syria; and ultimately he and his elder brother were made joint-tetrarchs of Judæa. But he was soon displaced by Antigonus, the representative of the Hasmonean dynasty, and forced to flee to Rome, where he obtained, through the patronage of Antony, a full recognition of his claims, and became tetrarch of Judæa, 40 B.C. Several years elapsed, however, before he succeeded in establishing himself in Jerusalem. On the fall of Antony he managed to secure a continuance of favour from Augustus, from whom he not only obtained the title of king of Judæa, but also a considerable accession of territory, 31 B.C. From this time till his death his reign was undisturbed by foreign war; but it was stained with cruelties and atrocities of a character almost without parallel in history. Every member of the Hasmonean family, and even those of his own blood, fell in succession a sacrifice to his jealous fears; and in the later years of his life the lightest shade of suspicion sufficed as the ground for wholesale butcheries, which are related in detail by Josephus. The slaughter of the innocents at Bethlehem is quite in keeping with his character; as was also his ordering the death of his wife Mariamne and his two sons by her. The one eminent quality by which Herod was distinguished, his love of magnificence in architecture, was evinced by the grandeur of the public works executed under his direction. Samaria rebuilt and Cæsarea were monuments of his zeal in building. Herod married no fewer than ten wives, by whom he had fourteen children. He died of a painful disease at the age of seventy, the year of Christ's birth—i.e. in the year 4 before the Christian era, as fixed by Dionysius Exiguus (see CHRONOLOGY, Vol. III. p. 227)—after a reign of thirty-seven years.—(2) HEROD ANTIPAS, son of Herod the Great by his wife Malthace, a Samaritan, was originally designed by his father as his successor; but by the final arrangements of the will of Herod the Great, Antipas was named tetrarch of Galilee and Perea. He divorced his first wife, the daughter of Aretas, king of Arabia Petræa, in order to marry Herodias, the wife of his half-brother Philip—an incestuous connection, against which John the Baptist remonstrated, and was in consequence put to death. It was during a visit of Herod Antipas to Jerusalem for the purpose of celebrating the passover that Jesus was sent before him by Pilate for examination. At a later time he made a journey to Rome in the hope of obtaining the title of king; but he not only failed in this design, but, through the intrigues of Herod Agrippa, was banished to Lugdunum (Lyons), where he died in exile.—(3) HEROD AGRIPPA I., son of Aristobulus and Berenice, and grandson of Herod the Great, was educated at Rome. He lived there in a very extravagant style until his debts compelled him to take refuge in Idumea. From this period almost to the death of Tiberius he suffered a variety of misfortunes, but, having formed a friendship with Caligula, he received from him, on his accession to the throne, the tetrarchies of Abilene, Batanæa, Trachonitis, and Auranitis. After the banishment of Herod Antipas he received his tetrarchy also—viz. Galilee and Perea. Claudius added to his dominions Judæa and Samaria, and he was thus the ruler of a more extensive territory than even was Herod the Great. He died at Cæsarea of a painful and incurable malady, 'eaten of worms' (Acts, xii. 23), in the fifty-fifth year of his age, and the 44th of the Christian era.—(4) HEROD AGRIPPA II., son of Agrippa I., was at Rome when his father died, and only seventeen years of age. Claudius therefore resolved to detain him for some time, and in the meanwhile re-transformed the kingdom into a Roman province. In 53 A.D. he left Rome,

and received from the emperor nearly the whole of his paternal possessions, which were subsequently enlarged by Nero. Like his ancestor Herod the Great, Agrippa was fond of building, and spent great sums in adorning Jerusalem and other cities; but he failed to secure the good will of the Jews. He did all in his power to dissuade them from rebelling against the Romans. When Jerusalem was taken he went with his sister to live at Rome, where he was made prætor, and where he died in the seventieth year of his age. It was before him Paul made his memorable defence.

Herodas, or HERONDAS, a Greek poet of the 3d century B.C., probably from the island of Cos, of whose *Mimiambi* (mainly scenes of Greek life in dialogue) only small fragments were known till some 700 verses from eight different poems were recovered from an Egyptian MS. in the British Museum and published by Kenyon (1891). They have since been edited by Bücheler, Crusius, and Meister.

Herodian, a Greek historian, who lived in Rome. His *History*, in eight books, extends from the death of Marcus Aurelius (180) to Gordian III. (238), and is fairly trustworthy. See editions by Bekker (1855) and Mendelssohn (1883).

Herodotus, 'the father of history,' was born between 490 and 480 B.C., between the first and the second of those two Persian invasions of Greece of which he was hereafter to write the history. He was born at Halicarnassus, one of those Greek colonies on the coast of Asia Minor which were conquered by the Persians, and whose efforts to recover liberty were the cause of the Persian wars. Halicarnassus, originally founded by Dorian settlers, had in course of time become an Ionic city, and consequently Herodotus wrote in the Ionic dialect. When the colonies were freed from the Persian yoke the citizens of Halicarnassus differed as to the form of government to adopt, and Herodotus left his native town. His travels were of remarkable extent: he travelled not only over Asia Minor and the islands of the Ægean Sea, but over Greece proper. He spent much time at Athens and at Delphi, and paid visits also to Sparta, Corinth, Thebes, Olympia, and Dodona. He also journeyed to Macedonia, Thrace, and the coasts of the Black Sea. Above all he penetrated to the interior of the Persian empire, to Susa, Ecbatana, and Babylon; and he 'did' Egypt. On the journey thither he visited Tyre, and from Egypt he reached Cyrene. In 443 B.C. the colony of Thurii was founded by Athens, and Herodotus joined it, whether in that year or not is uncertain. From Thurii he visited Sicily and Lower Italy. He lived to the beginning of the Peloponnesian war, 432 B.C., and perhaps not later than 425 B.C., but when, where, or how he died we do not know. Cuneiform inscriptions prove that the revolt of the Medes referred to in book i. 30 took place under Darius I., and not Darius II., so that we cannot infer from the passage that Herodotus was alive at the latter date (409 B.C.).

Herodotus, then, spent a large part of his life in travelling. These travels he undertook for the purposes of his history, and his activity, mental as well as physical, in collecting information and making inquiries, historical, geographical, ethnological, mythological, and archæological, was extraordinary. His history was designed to record not only the wars but the causes of the wars between Greece and the barbarians: thus, as to the Greek the whole world was either Greek or barbarian, he could have no difficulty in finding a place for all his information. The way in which he actually weaves it together is as follows. Beginning with the conquest of the Greek colonies in Asia Minor by the Lydian king Crœsus, he has an opportunity for giving a history of the kings of Lydia and a description of the country. The Lydians were conquered by the Persians, whose history and empire have now to be described. Amongst the conquests of Cyrus were Babylon and the Massagetæ; of Cambyses, Egypt, the account of which fills book ii. In book iii. the organisation of the Persian empire by its great statesman-king, Darius, enables Herodotus to emphasise the contrast between the might and magnitude of Persia on the one hand and the inferiority of Greece on the other. The invasion of the Scyths by Darius in book iv. allows Herodotus to place the remarkably interesting ethnological information he had gathered from the emporiums on the coast of the Black Sea. And the statement that Darius intended to invade the north coast of Africa brings in what Herodotus had learned at Cyrene and on the journey to it. In books v. to ix. we have the history of the two Persian wars.

Herodotus has been called 'the father of history,' but, as we have seen, he has an equal right to be called 'the father of geography.' This combination of history and geography is not a feature which distinguishes him from his predecessors, the 'logographers.' They not only composed chronological lists, containing probably a brief account of the events recorded, but they also composed topographical works, which, however, contained in many cases a history of the places described. Thus history and geography (scarcely discriminated) existed before Herodotus' time, nor did he divide them. But the work of Herodotus is to the bald, brief, disconnected notes of his predecessors what the work of Homer was to the poems of his predecessors. It is the beginning of Greek prose, as is Homer's of Greek verse; but whereas we have no fragment of any of the poets who lived before Homer, we have of the prose-writers before Herodotus, and the advance in point of form is remarkable. In reading Herodotus we feel very strongly that the style is the man, possibly because we know so little of the man; but in any case the character revealed by the style is sympathetic in a high degree, and probably few writers of any age or country have so many devoted personal friends as Herodotus counts amongst his readers. He is so simple, so frank, so talkative, amiable, and respectworthy. He wrote indeed not to be read, but to be heard, like all other classical Greek authors, and he read his history in public at Athens and other places. Thus we may account partly for the fact that we seem to hear him talk rather than to be reading an author. But, beyond the charm of style, Herodotus had the knack of taking interest in the right things—i.e. things which have continued to interest people for 2300 years. On the one hand, he could write in a spirit worthy of the glorious fight for liberty fought by the Greeks at Marathon, Thermopylæ, and elsewhere. On the other, he delighted in the manners and customs of strange peoples, and in things ancient and mysterious. As to his honesty as a historian there is practically no doubt—the author of the *De Malignitate* and Professor Sayce notwithstanding: he never says what he does not believe. He does not apparently suppress alternative versions, and he distinguishes between what he saw and what he was told. He did not believe all that he was told, though he did believe occasionally things which were not true. He is not a scientific historian: what he tells is frequently not history: it is something better—legend. Very possibly he wholly misconceives the strategy of Mardonius, but he preserves the *ēthos* of the Greeks who fought—which is of much more moral importance. His story about Rhampsinitus is altogether unhistorical, but it is not only more interesting but more valuable for the history of the people than hieroglyphic inscriptions recording

the number of captives taken or killed by some king.

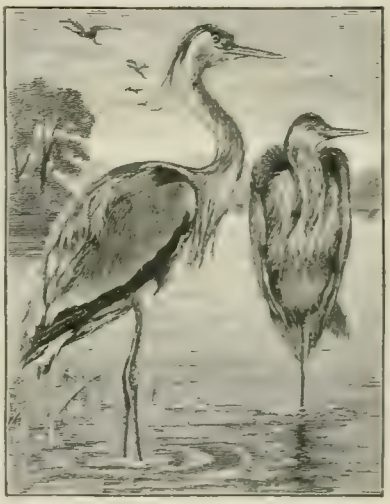
The *editio princeps* is by Aldus (1502). The best critical editions are those by Gaisford and Stein (Berlin, 1869). The best Latin commentary is that of Baehr (Leip. 1856); the best German, Stein (Berlin, 1877); the best English, Rawlinson (4 vols. 1858). The last contains a translation. Another English translation is by G. C. Macaulay (2 vols. 1890). The appendices to Professor Sayce's edition of books i.–iii. are valuable.

Heroes were, in the Homeric period, the kings, princes, generals, leaders, all brave warriors, and men who excelled in strength, courage, wisdom, and experience. Many of these had, on account of such qualities, a fabled origin, half human, half divine, and were honoured after their death with a kind of adoration or inferior worship. These heroes and demigods were recognised as the special patrons or protectors of particular countries, cities, or families, as the Pelopidæ, Atridæ, &c., and temples and altars were raised to them. Poetry exalted the heroic sentiment to sublimity; and poems which celebrate the deeds of heroes are themselves termed heroic. The imaginary time when heroes and other semi-divine beings lived on earth was called the Heroic Age.

Heroic Verse. See METRE.

Hérold, LOUIS JOSEPH FERDINAND, French musical composer, was born at Paris on 28th January 1791, and studied at the conservatoire of music in that city. His earliest successes were achieved with *Mdlle. de la Vallière* (1812), a cantata, which gained him a travelling scholarship; the opera, *La Gioventù di Enrico Quinto* (1815); and the comic opera, *Les Rosières* (1816). None of his succeeding pieces met with success, until the opera *Marie* appeared in 1826. *Zampa* (1831) and *Le Pré aux Clercs* (1832), which followed next, were both decidedly successful; the former is still put on the stage from time to time. Hérold died on 19th January 1833 at Thernes near Paris. See Jouvin's *Hérold, sa Vie et ses Œuvres* (1868).

Heron, a genus (Ardea) and family (Ardeidæ) of birds of the order Herodiones. The Herodiones (which includes also the families of storks, spoonbills, and flamingoes) are large birds covered with long loose down, with large wings, and a hard horny bill longer than the head, compressed from side to side, and united to the skull by firm broad bones. The Ardeidæ are distinguished from the other families by their large hind-toe, which rests on the ground and has a large claw equal in size to the claw of the middle toe, and by the inner margin of the middle toe having a pectinated or comb-like structure. The family comprises five genera—the Herons (Ardea), the Night Herons (Nycticorax), the Bitterns (Botaurus), the Boatbills (Cancroma), and the Tiger-bitterns (Tigrisoma). In the Heron genus—which includes the species commonly known as Egrets—the plumage is beautiful, but seldom exhibits very gay colours, white, brown, black, and slate, finely blended, generally predominating. The body is small in proportion to the length of the neck and the limbs. The neck is usually curved. See the article FLYING (with illustration) for the position of the neck, wings, &c. in flight—when the long legs are carried straight out, projecting like a tail. Herons are very voracious, feeding mostly on fish and other aquatic animals; but they also often prey on snakes, frogs, rats, and mice, and the young of other birds. They are usually shy, solitary birds, going about singly, but at nesting-time congregating in numbers, possibly more from community of purpose than from the true gregarious instinct. The Common Heron (*Ardea cinerea*) measures about three feet from the point of the bill to the tip of the tail. It is of a delicate gray colour on the upper parts, the quill-feathers are black, the tail of a deep slate colour, and the long plume is glossy dark. It generally builds its nest on a high tree; and as many as eighty nests have been counted on a single oak. Though in the days of falconry, when it was the chief game pursued, it was highly prized for the table, the common heron is now the object of almost universal hostility. Its geographical distribution is wide, extending from Britain to the countries of northern and southern Europe, being most plentiful in Holland, extending into northern Africa, Caucasus, India, Japan, and Java.—The Purple Heron (*A. purpurea*) is a somewhat rare British species.—The Great White Heron or Great Egret (*A. alba*), an extremely beautiful bird with perfectly white plumage, much of it loose and flowing, is an accidental



Common Heron (*Ardea cinerea*).

visitor to Britain. It is more common in Turkey and Greece and in some parts of Asia, where its upper tail coverts are much worn as plumes.—The Little Egret (*A. garzetta*), a smaller copy of the great egret, and frequenting the same localities, is about two feet long, and rather quicker in flight than the larger species.—The Buff-backed Heron (*A. æquinoctialis*) of southern Europe is an insect feeder, and by no means so shy as other species.—America has many species of herons, most numerous in its warmer parts. A common species of the temperate parts is the Green Heron (*A. virescens*), whose flesh is much esteemed. Other important species are the Great Blue Heron (*A. herodias*), the Great White or Florida Heron (*A. occidentalis*), the Great White Egret (*A. egretta*), and the Little White Egret (*A. candidissima*).—The Peacock Heron (*A. helias*) of South America, a small heron of exquisitely graceful shape and mien, with plumage variegated with coloured spots and bars, is a favourite pet-bird of the Brazilians.

Herondas. See HERODAS.

Herophilus, one of the greatest physicians of antiquity, and co-founder of the celebrated medical school of Alexandria, was born at Chalcedon, in Bithynia, and flourished in the 4th and 3d centuries B.C. He distinguished himself in particular by his devotion to anatomy, especially of the brain and those parts which were less known. He was a skilful dissector, and is said to have even dissected criminals alive; moreover, he was a bold and dexterous surgeon. The few fragments of his writings which remain were published at Göttingen in 1840.

Herostratus. See EPHESUS.

Herpes (Gr., from *herpo*, 'I creep'), the name of a group of diseases of the skin, characterised by the presence of clusters of vesicles on an inflamed base. There are two well-defined classes included under the name.

(1) *Catarrhal herpes* occurs most commonly at the edge of the lip, and often attends some febrile disease, especially acute inflammation of the lungs; but may also follow some local irritation, or be without assignable cause. It is attended sometimes by burning or itching sensations, but rarely by pain. The vesicles dry up into a scab, which falls off in the course of a few days. No treatment is generally necessary; but it is very apt to recur. It appears less commonly on other parts of the face, on the mucous membrane of the mouth, and on the genital organs.

(2) *Herpes zoster* (Gr.; Lat. *zona*; Eng. *shingles*, plural of Old Eng. *sengle*, 'a girth,' through Fr. from Lat. *cingulum*, words all meaning 'a girdle') is most commonly met with along the course of one of the intercostal nerves, whence the name. It is now known that the inflammation of the skin depends upon an inflammation of the nerve supplying the area affected, though many forms of inflammation of the nerves occur without producing herpes. Its occurrence can sometimes be traced to a blow, to diseased tissues in the neighbourhood, or to the prolonged administration of arsenic; but more often no cause can be assigned for it. The appearance of the characteristic eruption is generally preceded for some days by neuralgic pain in the affected part; inflammation of the skin in patches, development of vesicles, formation of scabs and their subsequent detachment generally run a pretty uniform course, occupying about a fortnight. In young people nothing is left but slight scarring of the skin; but in those beyond middle life an extremely intractable form of neuralgia often remains, and may persist for months. The disease may occur at any age, but a second attack is quite exceptional. More than one intercostal nerve may be affected at once; but very seldom two on the opposite sides, so that the popular superstition 'that shingles which meet round the body always prove fatal' is not likely to be often practically refuted. Though commonest in connection with the intercostal nerves, herpes zoster may occur on almost any region of the body. The brow is a frequent situation; and if the eye is affected, as sometimes happens, it may be seriously damaged. No treatment seems to be effective in arresting the course of the disease; but painting with flexile collodion, or application of zinc ointment over the inflamed patches, diminishes their irritability.

Herpetology (Gr. *herpĕton*, 'a reptile,' and *logos*, 'a discourse'), that branch of natural history which treats of reptiles. See REPTILES.

Herrera, FERNANDO DE, a Spanish lyric poet, of whom we only know that he was born at Seville in 1534, took orders, and died in 1597. As a poet he ranked so high in the opinion of his contemporaries that they bestowed upon him the appellation of the *divine*. Many of his love-poems are remarkable for tender feeling, while his odes, such as that on the 'Battle of Lepanto,' frequently display a lofty enthusiasm; but his language is very artificial, being full of words, inflections, and inversions in imitation of Greek, Latin, and Italian authors. Many of his poems were accidentally burned shortly after his death; most of what survived were published by Pacheco, the painter, in 1619, and all were printed in the *Coleccion* of Ramon Fernandez (1786; new ed. 1808). Herrera wrote in prose a good *Account of the War in Cyprus* (1572), and translated from the Latin of Stapleton a life of Sir T. More (1592).

Herrera, FRANCISCO, surnamed EL VIEJO (the Elder), Spanish painter, was born in Seville in 1576. His drawing was correct, and his pictorial style is marked by energy, freedom, and boldness, and he became the founder of a school. Herrera's masterpiece was the 'Last Judgment,' in a church at Seville. Besides historical pieces, he also painted such subjects as wine-houses, fairs, carnivals, and the like; he was a clever worker also in bronze. In 1650 he removed to Madrid, and died there in 1656. Some of his best works are in the Louvre at Paris.

His youngest son, FRANCISCO HERRERA, surnamed EL MOZO (the Younger), was born at Seville in 1622. He studied under his father, but to escape his roughness and cruelty ran away to Rome, where he became celebrated for pictures of still life, especially for fish-pieces. Returning to Spain after his father's death, he at first settled in Seville, and was in 1660 appointed sub-director of the academy there; but he soon betook himself to Madrid, where he became painter to the king. His best works are a fresco, 'The Ascension,' in the Atocha church in Madrid, and 'San Francisco,' in Seville cathedral. Herrera died at Madrid in 1685.

Herrera y Tordesillas, ANTONIO, Spanish historian, was born at Cuellar, in Segovia, in 1549, was appointed by Philip II. historiographer of the Indies and of Castile, and died at Madrid, 29th March 1625. His principal work is a *General History of Castilian Exploits in the Pacific* (1601–15), that is, a history of the Spanish-American colonies from 1492 to 1554 (Eng. trans. by John Stevens, 1725). His *Descripcion de las Indias Occidentales* (1601 and 1615) forms an introduction to the above work. He also wrote on the history of England and Scotland in the time of Mary Stuart; histories of Portugal, of the world in the time of Philip II., of the League, and of the Spanish, French, and Venetians in Italy.

Herrick, ROBERT, a great English poet, was born in London, the fourth son and seventh child of a prosperous Cheapside goldsmith of good Leicestershire descent, and was baptised 24th August 1591. His father died the year after, not without suspicion of suicide, and the boy was bound apprentice for ten years to his uncle, afterwards Sir William Herrick, also a well-to-do Cheapside goldsmith. By September 1613, however, we find him a fellow-commoner at St John's College, Cambridge, whence he sent fourteen letters, still extant, to his guardian-uncle, who appears to have been stingy in his allowances of money. The last letter is dated from Trinity Hall, whither he writes he had migrated for economy. Herrick took his M.A. in 1620, and apparently came next to London, where, no doubt, he plunged lightheartedly into the gaieties of the town, as well as 'those lyric feasts made at the Sun, the Dog, the Triple Tun.' He was already a poet, and his 'wild, unbaptisèd rhymes' quickly earned him the friendship of Ben Jonson and his ring of hilarious spirits. In 1629 his mother died, and in the same year he took orders, and was presented to the sequestered living of Dean Prior, near Totnes, in Devonshire. He bemoans his lonely banishment in 'loathèd country life' among 'currish' natives in 'dull Devonshire,' but from his poems we cannot doubt that his keen eye and kindly heart found him a consolation in the observation of the honest country-folk around him whose old-world customs are mirrored so charmingly in his verse. Of his clerical life we know but little, although Wood speaks of his 'florid and witty discourses,' and tells us he was 'beloved by the neighbouring gentry.' He has immortalised his housekeeper, 'Prue' or Prudence

Baldwin, as well as his spaniel 'Tracy,' and a tradition long survived of a 'favourite pig, which he amused himself by teaching to drink out of a tankard.' His 'Julia' is more visionary than these, but no doubt had her existence also. In 1647 the Puritan supremacy ejected him from his vicarage and drove him to London, whence he returned to reassume his duties in August 1662. Here twelve years later he died, being buried 15th October 1674. A monument was placed in the church in 1857.

Herrick's one volume of verse contained the *Hesperides*, dated 1648, and *Noble Numbers*, dated 1647. The last is a collection of professedly religious poetry; the former, an ill-arranged group of lyrical poems addressed to friends and eminent contemporaries, amatory poems, epithalamia, epigrams, fairy poems, and short occasional odes and poems on all kinds of subjects, of which sixty-two had already seen the light in *Wit's Recreations* (1640). The whole embrace more than 1200 poems of lengths varying from five or six pages to a single couplet, many of which are among the most exquisite examples of lyrical art in English. Of these it is enough to name 'Corinna's going a Maying,' 'The Mad Maid's Song,' 'The Night Piece to Julia' ('Her eyes the glow-worm lend thee'), 'To the Virgins' ('Gather ye rose-buds while ye may'), 'To Daffodils,' 'Cherry Ripe,' 'To Anthea' ('Bid me to live'); and, among religious poems, such masterpieces as 'The Litany,' 'The Dirge of Jephthah's Daughter,' and 'A Thanksgiving to God' ('Lord, thou hast given me a cell'). Much of his religious poetry is weak, but these are immortal. Yet the reader turns most often to his secular poems, in almost every line of which he will find a charm of a quite peculiar nature, save only in the epigrams, which are often poor and sometimes gross. The last laureate of fairyland, his 'Fairie Temple,' 'Oberon's Feast,' and 'Oberon's Palace' were not unworthy to follow Shakespeare's *Midsummer Night's Dream* and Drayton's *Nymphidia*.

The *Hesperides* is one of the sunniest books in English literature, consummate in finish, exquisite in fancy, fresh and natural throughout, and rich in sweet and delightful pictures of the homely English country and the quaint, kindly, old-world customs of her folk. His love-poems are stamped with a real *abandon* that is not Horatian and not Anacreontic, but all his own, and ever throughout his joyousness the ear detects an undertone of melancholy. In unforced sweetness of melody and perfect harmony of sound and sense Herrick rises above all his brethren among the Caroline lyrists, and, indeed, follows closely in the steps of Shakespeare. Like the master he is thoroughly natural, unaffected, and English. We do not look for depth and intensity of passion in his work, but within his limits he attains perfection. The fresh fragrance of English meadows lives in his verse, and will beget perpetual delight as long as English literature is read. He sleeps secure of the eternity of fame for which he longed, and which he half-promised to himself.

After being neglected for more than a hundred years Herrick's poems were revived by Mr Nichols (Sylvanus Urban) in the *Gentleman's Magazine* of 1796 and 1797. Editions followed by Dr Nott (1810), T. Maitland (Lord Dundrennan, 1823), W. C. Hazlitt (1869), and Dr Grosart (3 vols. 1876, with an exhaustive memorial-introduction). See F. T. Palgrave's *Chrysomela* (1877), a selection by a fine critic, with a suggestive introduction; and Edmund W. Gosse's essay in *Seventeenth-Century Studies* (1883).

Herring (*Clupea harengus*) belongs to the order of bony fishes (Teleostei) called Physostomi, and characterised by the existence of an open communication between the air-bladder and the gut. The family Clupeidæ is distinguished by the following characters: There is a single short dorsal fin near the middle of the dorsal edge of the body, also a single anal fin. The pelvic fins are abdominal in position, as in all Physostomi. Body covered with thin cycloid scales, head naked, barbels absent. Maxillary bones composed of at least three movable pieces. Branchial apertures very wide. The stomach has a posterior prolongation, which communicates with the air-bladder at its extremity; pyloric appendages numerous. Lateral line usually absent. The genus Clupea, which includes the herring, sprat, pilchard, and shad, is thus defined: Body compressed, with the scales of the ventral edge keeled, each keel projecting posteriorly into a point, so that the edge is serrated. Upper jaw not projecting beyond the lower. Cleft of the mouth of moderate width. Teeth, when present, rudimentary and deciduous. Caudal forked. *C. harengus* is distinguished by having an ovate patch of minute teeth on the vomer; the serrations of the ventral edge are weak; the pelvic fins arise behind the front end of the base of the dorsal. These characters distinguish the herring from the sprat. From the pilchard it is easily distinguished, as that species has much larger scales, and has radiating ridges on the operculum which are absent in the herring. The shad, of which there are two kinds, are much larger, and have opercular ridges like the pilchard. The air-bladder in the herring has an opening to the exterior behind the anus. The herring is a pelagic and gregarious fish, living on the small pelagic organisms, especially Crustacea, which swarm in the sea. The species occurs throughout the German Ocean and the North Atlantic, both on the American and European sides, and also the seas to the north of Asia. Enormous shoals of herring approach the coast every summer in order to spawn, and it is then that the great fisheries are carried on. There are in most places two spawning periods, but the number of those which spawn in winter or spring is always much smaller. The summer spawning season varies in different latitudes. On the east coast of Britain it occurs in June and July at Wick, July and August at Peterhead and Aberdeen, August and September at Yarmouth, September and October off Kent, while on the south coast of England only one spawning period has been observed, namely in January. This corresponds to the winter spawning in the north, which at the mouth of the Firth of Forth takes place in January and February.

The eggs of the herring are small and numerous, and are heavy and adhesive, so that when shed they adhere to the stones, shells, and hydroids, or other material of the sea-bottom. The spawning-ground chosen is always hard, rough, and often rocky, so that it is usually ground which trawls cannot be worked over. The same spawning-grounds are annually visited by the winter-spawning herring. Two such grounds are accurately known—one to the west of the isle of May at the mouth of the Firth of Forth, and one off Ballantrae on the west coast of Scotland, in Ayrshire. None of the summer spawning-beds have been actually discovered, though it is certain that there are acres of them along the east coast of Britain. It is probable that herring remain in Loch Fyne all the year round, and young and half-grown herring are often found in estuaries at various times of the year, ascending as far as the tides extend.

The artificial fertilisation of the herring's ova and their hatching in aquaria are easily effected, and have been carried out several times by various experimenters. But the artificial propagation has never been carried out on a large scale for the sake

of artificially maintaining or increasing the supply of herrings, because it has never yet been proved that the supply has anywhere continuously diminished in consequence of the enormous captures which are annually made. The abundance of the fish at a particular place varies capriciously from year to year, and at different periods of time. On the coast of Bohuslän, in the south of Sweden, multitudes of herring have appeared within the last few years after they had deserted that coast for about seventy years.

Herring-eggs were first hatched under observation by Prof. Allman, in Scotland, in 1862; the eggs in this case were dredged from the bottom off the isle of May. In 1874–78 the eggs were both fertilised and hatched artificially by the German Fishery Commission at Kiel. The development has been described by Kupffer, in 1878, in the annual report of the Kiel Commission. Artificial hatching has also been carried out by the United States Fish Commission. The eggs, when pressed from the fish, are received on glass plates, to which they adhere, and are then developed in a current of pure sea-water. The larva, when hatched, is very slender and elongated: it is perfectly transparent, and at once commences to lead a pelagic existence in the surface waters of the sea. Herring-spawn at the bottom of the sea is largely devoured by flat-fish and haddocks, which are extremely fond of it.

Meyer, of the Kiel Commission, noted the growth of the herring in captivity: when first hatched it is $\frac{1}{4}$th to $\frac{1}{3}$d of an inch long; one month after hatching it is $\frac{2}{3}$ds of an inch; at two months it is $1\frac{1}{4}$ inch; at three months about 2 inches. Then it grows at the rate of about half an inch per month, so that at six months it is about $3\frac{1}{2}$ inches, and at one year $6\frac{1}{2}$ inches. Thus the herring is mature at two years old, but not full-sized. The so-called 'maties,' which are mature fish, and shed spawn and milt, are probably the two-year-old fish spawning for the first time, while the full-grown herring are three or four years old.

For detailed information on the natural history of the herring, see *Nature* (vol. xxvi. p. 607, and vol. xxix. p. 539) and the 'Jahresberichte' of the *Commission zur Untersuchung der Deutschen Meere*, which contain numerous elaborate memoirs on the subject. See FISHERIES.

Herrings, BATTLE OF. See FASTOLF.

Herrnhut, a small town in the kingdom of Saxony, 18 miles SE. of Bautzen, celebrated as a chief seat of the Moravian Brethren (q.v.) or Herrnhuters, who settled here in 1722. Pop. 1125.

Herschel, SIR WILLIAM, born at Hanover, November 15, 1738, was the son of a band-master, and was educated as a professional musician. He first visited England as a member of the band of the Hanoverian Guards; but in 1757 he established himself in England, becoming a teacher of music in the town of Leeds, whence he went to Halifax as organist, and subsequently (1766) in the same capacity to Bath. Here he would seem to have first turned his attention to astronomy. Wanting a superior telescope, and unable to afford to buy a good reflector, he made one for himself—a Newtonian, of 5 feet focal length, and with this applied himself to study the heavens. In 1781 he made his first discovery, being a new planet, which at first he took for a comet. It was detected by an exhaustive process of surveying the heavens, which Herschel was the first to follow, taking the stars in regular series, and examining them all in their groups through the same instrument. The result of his discovery was his appointment to be private astronomer to George III., with a salary of £200 (afterwards £250) a year. He then went to live at Slough, near Windsor, where, assisted by his sister Caroline, he continued his researches. Herschel married a Mrs Mary Pitt, and left one son, John. He was knighted by George III., and made a D.C.L. by the university of Oxford; he became rich partly through his wife's jointure, and partly through selling mirrors for reflecting telescopes. He died at Slough, 25th August 1822.

Herschel contributed sixty-nine papers to the *Philos. Trans.* between the years 1780 and 1815; and to the first vol. of *Mem. of the Astron. Society* he contributed a paper 'On the Places of 145 New Double Stars.' He greatly added to our knowledge of the solar system: he discovered Uranus (called by him Georgium Sidus) and what he took for its six satellites, and two satellites of Saturn. Besides this he detected the rotation of Saturn's ring, the period of rotation of Saturn itself and that of Venus, the existence of the motions of binary stars, the first revelation of systems besides our own. He extended our knowledge of the Milky Way and the constitution of nebulæ, and, in fact, was the first to give the human mind any conception of the immensity of the universe. His catalogue of double stars, nebulæ, &c., and tables of the comparative brightness of stars, and his researches in regard to light and heat would of themselves entitle him to the first rank as an astronomer and natural philosopher. He erected a famous monster telescope of 40 feet length. It was begun 1785, and finished 1789, in which year he by means of it detected the sixth satellite of Saturn. See Herschel's *Life and Works*, by E. S. Holden (New York, 1881).

His sister, CAROLINE LUCRETIA, was born 16th March 1750, and lived in Hanover till 1772, when she came to England to live with her brother at Bath. When William turned astronomer she became his constant helper; and on his being appointed private astronomer to George III. she acted as his assistant, doing all the duties of an assistant-astronomer, and in that character receiving a small salary from the king. While discharging her duties in this position she found time for a series of independent observations with a small Newtonian telescope, made for her by her brother. Her special business was to sweep the heavens for comets, eight of which she discovered, in regard to five of which she has the credit of priority of discovery; and several remarkable nebulæ and clusters of stars included in William's catalogues were described from her original observations. In 1798 she published, at the expense of the Royal Society, *A Catalogue of Stars taken from Mr Flamsteed's Observations*, which contained 561 stars omitted in the British catalogue. She lived with her brother during the whole of his career, sharing his labours and distinctions, and on his death returned to her native country. She was then seventy-two years of age, but she lived to be ninety-eight, retaining all her faculties to the last. In 1828 the Astronomical Society conferred on her their gold medal, and she was an honorary member of the society. She died 9th January 1848. See her *Memoir and Correspondence*, edited by Mrs Herschel (1876).

SIR JOHN FREDERICK WILLIAM HERSCHEL, the only son of Sir William, was born at Slough, 7th March 1792, and educated at Eton and St John's, Cambridge, where, in 1813, he was senior wrangler and first Smith's prizeman. His first publication was *A Collection of Examples of the Application of the Calculus of Finite Differences* (1820). In 1822 he applied himself especially to astronomy, using his father's methods and instruments in observing the heavens. For a time he worked with Sir James South in re-examining the nebulæ and clusters of stars described in his father's catalogues. The results of the re-examination were given in

1833 to the Royal Society in the form of a catalogue of stars in order of their right ascension. The catalogue contained observations on 525 nebulæ and clusters of stars not noticed by his father, and on a great number of double stars—in all between 3000 and 4000. This important contribution to science led to his being acknowledged as the worthy successor of his father; so early, indeed, as 1826 the Royal Society had voted to him and South a gold medal apiece for their observations on double stars; but by 1833 his pre-eminence was beyond the necessity of being marked by acknowledgments. His treatises on Sound and on the Theory of Light had appeared in the *Encyclopædia Metropolitana* (1830–31); his treatise on Astronomy (1831) and the 'Preliminary Discourse on the Study of Natural Philosophy' in Lardner's *Cyclopædia*; not to mention his papers in the *Transactions of the Astronomical Society*. In January 1834 Herschel arrived at the Cape of Good Hope, with the intention of completing the survey of the sidereal heavens, by examining the southern hemisphere as he had done the northern. Here he established his observatory at Feldhausen, six miles from Table Bay; and in four years, working all the time at his own expense, he completed his observations. The public interest taken in his labours was, as might be supposed, very great; but though now and then gratified by partial statements of his results, it was not till 1847, nine years after his return from the Cape, that it received full gratification in the publication of a volume of *Astronomical Observations made at the Cape; being the Completion of a Telescopic Survey of the whole Surface of the Visible Heavens commenced in 1825*. It need not be said that the results of these labours are invaluable. They are now incorporated into all books on astronomy. Herschel, when at the Cape, gave an impulse to the science of meteorology, having the merit of having suggested the scheme for taking meteorological observations simultaneously at different places.

On his return to England honours were showered on him—he was made D.C.L. of Oxford, and, on the Queen's coronation, a baronet. He was president of the Astronomical Society, and in 1849 became Master of the Mint. His articles on Meteorology, Physical Geography, and Telescope, contributed to the *Encyclopædia Britannica*, were published separately; and his *Popular Lectures on Scientific Subjects* (new ed. 1880) and *Collected Addresses* are well-known works. Herschel was also a distinguished chemist, and attained important results in photography independent of Fox Talbot. His researches on the undulatory theory of light were very valuable. He had also a profound interest in poetry, and made translations from Schiller and from the *Iliad*. He died at Collingwood, in Kent, on 12th (not 11th) May 1871, and was buried in Westminster Abbey near Sir Isaac Newton. See Agnes M. Clerke, *The Herschels and Modern Astronomy* (1896).

Herschel, or URANUS. See PLANET.

Hersfeld, an old town of Hesse-Nassau, on the river Fulda, which here becomes navigable, 27 miles N. of Fulda by rail. Here are a fine Gothic church, built in 1320; the ruins of the cathedral, destroyed by the French in 1761; and the formerly-celebrated Benedictine abbey, founded in 769. Pop. 7271.

Hership, an old Scotch law term, denoting the offence of carrying off cattle by force.

Hertford, the county town of Hertfordshire, 26 miles N. of London by rail, is situated on the Lea, which is navigable for barges up to this point. It contains few buildings of any architectural importance, save one ancient church; but there are also a town or shire hall (1768), an infirmary, and a corn exchange and free library (1859). Hertford has a grammar-school and several charity schools, whilst at the entrance into the town on the London Road is a preparatory school in connection with Christ's Hospital (q.v.) in London. A considerable trade is carried on in corn, malt, and flour. Hertford returned two members to parliament till 1867, and in 1885 ceased to be a parliamentary borough. Pop. (1851) 6605; (1881) 7747; (1891) 7232. The New River (q.v.) has its source a mile east of the town, and 2 miles westward is Panshanger, the seat of Earl Cowper, with its valuable collection of pictures. Of the old castle of Hertford, commenced by Edward the Elder about 905 to protect the inhabitants from the incursions of the Danes, and strengthened by William the Conqueror, but a small portion now remains; the present castle was built by William Cecil, Earl of Salisbury, or Sir William Harrington, in the reign of James I., and in 1805–9 was occupied by the East India Company as a temporary college during the erection of Haileybury (q.v.). See Turner's *History of Hertford* (1830).

Hertfordshire, or HERTS, an inland county of England, extending 35 miles in a north-easterly direction and 20 miles in mean breadth, is bounded N. by Cambridge, E. by Essex, S. by Middlesex, and W. by Buckingham. It contains 611 sq. m., of which more than one-half is under tillage, one-fourth pasture, and one-seventeenth in wood; is divided into 8 hundreds, 2 municipal boroughs—viz. Hertford and St Albans—138 parishes, and has 11 market-towns, the chief of which are Hertford (the county town), St Albans, Watford, Hitchin, Hemel Hempstead, and Bishop-Stortford. Pop. (1801) 97,577; (1841) 156,660; (1881) 203,140; (1891) 220,125. The surface is mostly level, except in the north, where a branch of the Chiltern Hills skirts the county, Kensworth Hill (904 feet) being the highest elevation. The principal rivers are the Lea, the Stort, and the Colne, all affluents of the Thames, and the artificial stream called the New River (q.v.): the Grand Junction Canal, too, passes through the south-western extremity of the county. Chalk, at a greater or less depth below the surface, forms the basis of the soil, which is various, but principally loam and clay, the former being met with in nearly all its gradations, more or less intermingled with flint or sand. The climate is mild and healthy. As a manufacturing county Herts does not stand high. Straw-plaiting is, however, largely carried on in the north and west portions, where the land is least adapted for agriculture; in the neighbourhood of Watford and Rickmansworth are several paper and silk factories, and at Great Berkhampstead are extensive chemical works. The agriculture of the county has improved very much of late years, the quantity of barley and wheat grown being very considerable; immense quantities of hay, too, are sold off the land, and sent to London. Ware is the chief seat of the malting trade in the kingdom; Cheshunt, Waltham Cross, and Bishop-Stortford are famous for their rose-gardens, and in some districts watercress is extensively cultivated for the London market. Herts is almost entirely in the diocese of St Albans and in the South-eastern Circuit, and since 1885 has returned one member to parliament for each of its four divisions—North or Hitchin, East or Hertford, Mid or St Albans, and West or Watford. Many historical events are connected with the county: it was the scene, at Verulam near the present town of St Albans (q.v.), of contests with the Romans, and of the martyrdom of St Alban; in it, too, were fought three of the most important battles in England's history—the first in 1455,

when Henry VI. was wounded and taken prisoner at St Albans by the Yorkists; again at St Albans six years later, when victory decided for the opposite party; and lastly in 1471, at Barnet, when the decisive battle was fought, in which the Lancastrians were utterly routed by the Yorkists. Rye House was the residence of Rumbold, one of the persons engaged in the alleged plot against the life of Charles II. Kings Langley, Hunsdon House, and Hatfield were royal residences, and at Theobalds James I. ended his days. Amongst the worthies of Herts mention may be made of Nicholas Brakespeare, afterwards Pope Adrian IV.; Francis Bacon, afterwards created Lord Verulam; Richard Gough, the antiquary; the poet Cowper; Bulwer Lytton; Charles Lamb; and John Leech. Hertford gave a title to a branch of the family of Seymour (q.v.; and see EDWARD VI.). See Cussan's *History of Herts* (1880).

Hertha (true reading in Tacitus, *Nerthus*), the North German deity identified with 'Mother Earth,' to whom the Hertha Lake in Rugen was sacred.

Hertogenbosch. See BOIS-LE-DUC.

Hertz, HEINRICH, physicist, was born 22d February 1857, at Hamburg, and studied at Berlin, where in 1880 he became assistant to Helmholtz. In 1883 he began to lecture in Kiel, in 1885 was called to the technical school at Karlsruhe, and in 1889 succeeded Clausius at Bonn. He greatly advanced the science of electricity, was the continuator of the work of Faraday and Clerk-Maxwell, and was a singularly ingenious experimenter. He died 1st January 1894. In the three volumes of his collected works (1894) the most important discussions are those on the relation of light and electricity, on the diffusion of electric force, and on the principles of mechanics. See the *éloge* by Planck (1894), and Lodge in *Nature* for June 1894.

Hertz, HENRIK, Danish poet, was born of Jewish parents in Copenhagen, 25th August 1798, and studied for the bar. *Gjengangerbrevene* ('Letters of a Ghost'), a rhymed satirical poem, created a sensation in 1830. His finest dramatic writings are *Svend Dyring's Huus* (1837), a romantic drama; and *Kong René's Datter* (1845), a lyric drama (translated four times into English—in 1850 by Sir Theodore Martin). He also wrote many lyrics (4 vols. 1857–62), a lyrical comedy, and a humorous novel. He died 25th February 1870.

Hervé, whose proper name was FLORIMOND RONGER, a musical composer, was born on 30th June 1825, at Houdain, near Arras. In 1848 he made his first appearance in an operetta composed by himself, *Don Quichotte et Sancho Panza*. Then, after officiating for three years as director of the orchestra at the theatre of the Palais Royal, he worked as singer, composer, director, and actor in various theatres. Some of his light operas have had very successful runs, such as *L'Œil Crevé*, *Chilpéric*, and *Le Petit Faust*. He died November 4, 1892.

Hervey, JAMES, author of *Meditations among the Tombs*, was born at Hardingstone, near Northampton, on 26th February 1714. The facts of his life are few. He was educated at Northampton and Lincoln College, Oxford, and was first curate and afterwards incumbent of Weston-Favel and Collingtree, both near Northampton. He died on Christmas-day 1758. Hervey adopted a Calvinistic creed, and in the 18th century his works, though not distinguished by any extraordinary qualities, enjoyed great favour with the people. The best of them are *Meditations and Contemplations* (1746), including his most famous production, 'Meditations among the Tombs,' and also 'Reflections on a Flower Garden' and 'A Descant on Creation;' *Contemplations on the Night and Starry Heavens* (1747); and *Theron and Aspasio, or a Series of Dialogues and Letters on the Most Important Subjects* (3 vols. 1755). This last gave rise to the Sandemanian controversy as to the nature of saving faith. A complete edition of his works, with a memoir, appeared in 1797. See also his Life and Letters (2 vols. 1760).

Hervey Islands. See COOK ISLANDS.

Herwarth von Bittenfeld, KARL EBERHARD, Prussian general, was born in 1796, and gained his first laurels in the war of liberation, especially in the battle of Leipzig. In 1864, raised to the rank of general, he acquired great fame through his daring capture of the isle of Alsen. In the campaign of 1866 he was entrusted with the occupation of Saxony, and then with the command of the army which advanced from Saxony into Bohemia. He contributed largely to the brilliant victories of Hühnerwasser, Münchengrätz, and Königgrätz. In 1870, on the outbreak of the Franco-German war, he was made governor of the Rhine provinces, in 1871 a general field-marshal; and he died at Bonn, 2d September 1884. In the war of 1866 one of his sons fell; in that of 1870 two were killed.

Herz, HENRI, a pianist and composer for the pianoforte, was born of Jewish parentage at Vienna in 1806, and educated principally in Paris, where his talent was early recognised. His compositions became popular over Europe, and he was received with great applause on visiting England in 1834, and America in 1846. In 1837 he received the decoration of the Legion of Honour; and from 1842 till 1874 he was professor of Music at the Conservatoire of Paris. At the same time he managed a pianoforte factory, and in 1855 gained with his pianofortes the first prize at the Paris exhibition. His compositions, more than 200 in number, are mostly for the piano, and are characterised by melodic charm and a certain originality. He died 5th January 1888.

Herz, HENRIETTE, a lady of great beauty, high intelligence, and wide culture, and a Jewess, who, in the beginning of the 19th century, made her home at Berlin a gathering-place for the intellectual life of the city. Amongst those who either met in her salon or were in correspondence with her were the Humboldts, Fr. Schlegel, Gentz, Varnhagen von Ense, Rahel, Schleiermacher, and Börne. She was born at Berlin, on 5th September 1764, the daughter of a Jewish doctor of Portuguese origin, Benjamin de Lemos, and was married in 1779 to another doctor, Markus Herz. In 1817 she went over to Protestantism. She died on 22d October 1847. See her Life by Fürst (2d ed. 1858), and her correspondence with Börne (1861).

Herzegovina. See BOSNIA.

Herzen, ALEXANDER, a Russian author, was born at Moscow, 25th March 1812. In 1834, while yet a student, he was imprisoned for his political opinions. From 1842 he published much, principally novels and political works. In 1846 he left Russia, and eventually established himself in 1851 in London. At this time his voice had great weight in influencing public opinion in Russia, chiefly by means of his paper *Kolokol*, of which thousands of copies were smuggled into Russia, in spite of the government prohibition. But Herzen gradually lost his influence as he became more and more a party-man, and especially by his advocacy of the cause of the Poles at the outbreak of their rebellion in 1863. He died at Paris, 21st January 1870. Of his numerous works may be mentioned the novels *Who is to Blame?* and *Dr Krupoff*, and *From the Other Shore*, *Letters*

from Italy and France, Development of Revolutionary Ideas in Russia, Baptised Property (Serfdom), and *The Social Condition of Russia*. Many of these appeared under the pseudonym of Iskander. He also edited *Memoires de l'Impératrice Cathérine* (1859), and the works of Pushkin, Lermontoff, &c. His collected works appeared in Russian in 11 vols. at Basel, 1875 *et seq.*

Herzog, JOHANN JAKOB, a theologian of the Reformed creed, was born at Basel, 12th September 1805, and, after studying at Berlin, became professor at Lausanne (1830), Halle (1847), and Erlangen (1854). He died 30th September 1882. Amongst his works are a book on the Plymouth Brethren (Lausanne, 1845), lives of Calvin and Œcolampadius, a work on the Waldenses, and a church-history; but his name is best known for the great theological encyclopædia edited by him, *Realencyklopadie fur Protestantische Theologie und Kirche* (22 vols. Gotha, 1854-68); new ed. by Herzog, Plitt, and Hauck (18 vols. 1877-88); English abridged ed. by Schaff (3 vols. 1882-84).

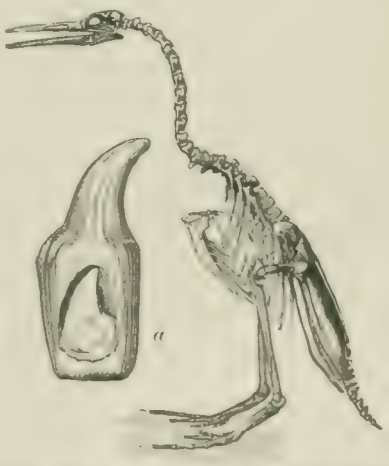
Hesiod, the earliest didactic poet of Greece of whom we have any knowledge, was born in Ascra, a small village at the foot of Mount Helicon. As he himself informs us, in his boyhood he tended flocks on the mountain. On the death of his father he became engaged with his brother, Perses, in a lawsuit as to the division of their patrimony. His brother bribed the 'kings' or judges, and thus gained unjust possession of the property, which, however, he soon dissipated. But Hesiod prospered, and when Perses in his poverty applied to him for aid Hesiod gave him the good advice which forms the larger part of his *Works and Days*. According to a passage (if genuine, 646-662) in the same poem, Hesiod attended the funeral games of Amphidamas at Chalcis, in Eubœa, and there recited a hymn of his composition which gained him the prize. It was probably for some such festival that he composed the *Theogony*. Where or how Hesiod died we do not know. The only data we possess for fixing the time at which Hesiod lived are those contained in his works, for although Herodotus makes Hesiod contemporary with Homer, he can have had no sufficient evidence to go upon. The poems of Hesiod show acquaintance with a wider geographical horizon, especially westwards, than do those of Homer; the language is in a later stage, the digamma more frequently neglected; and, finally, in Hesiod there are unmistakable imitations of Homer. We may therefore safely conclude that Hesiod was later than Homer —possibly belongs to the end of the 8th century B.C.

The *Works and Days* is generally considered to consist of two originally distinct poems, one containing the good advice to his brother, preaching up honest labour and denouncing corrupt and unjust judges; the other, the real *Works and Days*, containing advice as to the days lucky or unlucky, proper or improper, for the farmer's work. The *Theogony* teaches the origin of the universe out of Chaos, the creation of earth and hell, of night and day, sea and sky, sun and moon, and the history of the gods. Bœotian tradition denied that the *Theogony* was the work of Hesiod, but Herodotus affirms it (ii. 53), and the internal testimony and the similarity of the language of the *Theogony* and the *Works and Days* confirms Herodotus. On the other hand, the *Shield of Heracles*, which has been preserved, and the *Catalogue of Women* and the *Eoœ*, which have not, were not genuine. The corrosive criticism which has been poured on the Homeric poems has also been applied to the Hesiodic; and here too the critics are not agreed whether the unity of the poems is the work of the original composer, and has been disturbed by interpolations, or is the work of some late editor harmonising lays originally unconnected. The dialect (Old Ionic) in which the Hesiodic poems are composed has also been attacked. Fick maintains that the *Theogony* was composed in the Delphic dialect, the *Works and Days* in ancient Æolic, and that they were subsequently rewritten in artificial Ionic.

Hesiod wrote not to please the imagination, but to improve the mind. Homer told tales, the tale of Troy, of Achilles, of Odysseus, 'lies like unto the truth,' as Hesiod would say. Hesiod's object was to tell the truth. His poetry is not very poetical, but it has its interest. In the first place, it is what the Greeks learned by heart as children and quoted as men for their moral guidance. In the next place, the *Works and Days* gives us an invaluable picture of the village-community as it existed in Greece in the 8th century B.C., and of the 'kings' of Homer as they appeared to the villagers. Finally, the *Theogony* is of the utmost importance to the comparative mythologist. The first edition of Hesiod appeared at Milan, 1493; other editions, Schömann (1869), Fick (1887). See also Gruppe, *Die griech. Kulte u. Mythen*, i. 567-612.

Hesperides, the name of the sisters who, assisted by the dragon Ladon, guarded the golden apples which Hera had received, on her marriage with Zeus, from Gæa. Their genealogy and their number are variously given by mythologists. The gardens of the Hesperides were placed far in the west, on the verge of the ocean, or in the land of the Hyperboreans. The apples were stolen by Hercules (q.v.), but were afterwards restored by Athena. See ATLANTIS.

Hesperornis, a remarkable extinct form of bird, the remains of which have been met with in the American Cretaceous deposits. As described by Professor Marsh, it possessed small pointed reptilian teeth, which were implanted in a deep



Restoration of Skeleton of *Hesperornis regalis*: *a*, tooth of do. with germ of second teeth (magnified).

continuous groove, somewhat like those of Ichthyosaurus. Its brain was small and more reptilian in type than that of any adult bird as yet examined. It appears to have been a large diving-bird, measuring over 5 feet from the point of the bill to the end of the toes. Its wings were rudimentary, its legs powerful, and its feet well adapted for rapid progression in water. The tail was broad, could move up and down, and was probably used as a rudder or swimming-paddle. The long slender jaws were united in front only by cartilage, as in serpents, and had on each side a joint which admitted of

some motion, so that 'the power of swallowing was doubtless equal to almost any emergency.' See ODONTORNITHES.

Hesperus, the Greek name (Lat. *Vesper*) for Venus as the evening star (see PLANET). Hence the Alexandrian grammarians called Italy, and sometimes all western Europe, *Hesperia*, 'the western land.'

Hesse (Ger. *Hessen*), or HESSE DARMSTADT, a grand-duchy of the German empire, lying between 7° 51′ and 9° 39′ E. long., and 49° 24′ and 50° 50′ N. lat. A strip of Hesse-Nassau divides it into a northern part, Oberhessen, completely enclosed by Prussia, and a southern part, comprising the two provinces of Starkenburg, east of the Rhine, and Rheinhessen, west of the Rhine. Besides these two main parts there are eleven enclaves in Baden and Prussia, the largest Wimpfen and Hohenstadt. Oberhessen is partly occupied in the east by the Vogelsberg, culminating in Taufstein (2532 feet), in the south-west by a ramification of the Taunus, the fertile and undulating valley of Wetterau lying between them. Starkenburg, in the south-east, is covered by the larger part of the Odenwald. The Bergstrasse divides the uplands of Starkenburg on the east from the plain of the Rhine on the west. This plain merges in the north into the plain of the Main. Rheinhessen, fertile and populous uplands, laid out largely in vineyards, the principal industry of the province, lies between the three points, Kreuznach, Mainz, and Worms. With the exception of the streams to the east of Vogelsberg draining into the Fulda, the waters of Hesse belong to the Rhine system. Rhine, Main, Neckar, and Lahn Of the total surface, comprising 3000 sq. m., 50 per cent. is tilled land and garden, and 31 forest. The most important products are corn—particularly in the Rhine and Main plains, and in Wetterau—pulse, potatoes, rape, poppy, tobacco, flax, fruit, and vines. Hesse yields iron, manganese ore, and peat. The industries—mainly in Mainz, Offenbach, and Worms—include the making of leather, boots, upholstery, tobacco, cigars, chemicals, &c. For an old Hessian trade, see MERCENARIES.

The total population amounted in 1875 to 882,349, in 1885 to 956,611, in 1890 to 992,883. Of these 419,642 belonged to Starkenburg, and 666,118 were Protestants, 293,632 Catholics, and 25,331 Jews. Mainz (q.v.) is the largest town; Darmstadt is the capital. Hesse has a university at Giessen, with 550 students, and a technical university at Darmstadt, with 300 students.—The government is constitutional, the legislative power consisting of two chambers. The annual revenue for the period 1894–97 was estimated at £1,721,000, and the expenditure at £1,570,000.

The Hessen were an ancient German tribe, and their territory came to be included in the principality of Thuringia. We first hear of the landgrave of Hesse in the 13th century. On the death of Philip the Magnanimous in 1567 the landgraviate of Hesse was quartered among his four sons, into Cassel, Marburg, Rheinfels, and Darmstadt. The House of Rheinfels becoming extinct in 1583, and that of Marburg in 1604, Hesse was reconstituted in two divisions—Hesse-Cassel and Hesse-Darmstadt. After the French Revolution Louis X., under pressure of France, signed a treaty of neutrality, and (1805–13) supplied Napoleon with a contingent of troops against the other Germans. In 1806 Louis assumed the title of grand-duke. In 1813, after the battle of Leipzig, Louis joined the allies, and in 1815 had to acknowledge the independence of Hesse-Homburg. In 1866 Hesse, having sided with Austria, had to yield up certain territories, including Hesse-Homburg, recently acquired, to Prussia. In 1820 was founded a new constitution of government, modified in 1856, 1862, and 1872.

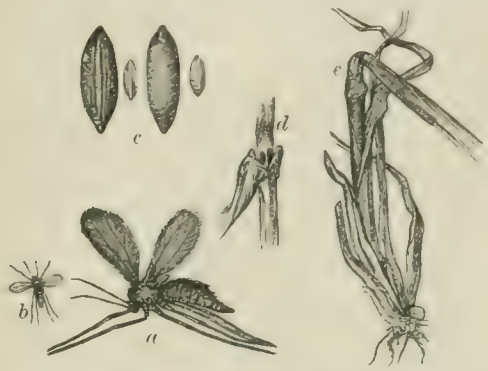
Hesse-Cassel, till 1866 a German electorate, now forming the government district of Cassel in the Prussian province of Hesse-Nassau (q.v.). Area, 3700 sq. m.; pop. (1864) 745,063. The landgraviate of Hesse-Cassel was formed by William IV., eldest son of Philip the Magnanimous, who died in 1567. Constituted an electorate in 1803, it was occupied by the French in 1806, incorporated with Westphalia in 1807, and reconstituted an electorate in 1813. The elector having joined Austria in 1866, Hesse-Cassel was incorporated with Prussia, as part of the province of Hesse-Nassau.

Hesse-Homburg, till 1866 a landgraviate of Germany, consisting of the lordship of Homburg vor der Höhe, on the right bank of the Rhine, and the lordship of Meisenheim, on the left bank. Area, 106 sq. m.; pop. (1864) 27,374. Since 1866 Hesse-Homburg has been incorporated with Prussia, Homburg now forming part of the district of Hesse-Cassel, and Meisenheim of that of Coblenz. Hesse-Homburg was constituted a landgraviate in 1596. In 1806 Hesse-Homburg became again incorporated with Hesse-Darmstadt, but in 1815 was decreed independent, while it was enlarged by the addition of the district of Meisenheim. In 1866 Hesse-Homburg reverted to Hesse-Darmstadt; but the grand-duke, having espoused the cause of Austria in the seven weeks' war, was forced to surrender Hesse-Homburg to Prussia.

Hesse-Nassau, a province of Prussia, between Bavaria and Saxony on the east and the Rhine on the west, was formed (1867–68) out of parts of the former electorate of Hesse-Cassel, of the former Duchy of Nassau, of the lordship of Homburg forming part of the former countship of Hesse Homburg, of the larger part of the former free town of Frankfort-on-the-Main, and small parts of Bavaria. It comprises 5943 sq. m. The surface consists mostly of uplands, contrasting with the Main plain and part of Wetterau in the south, and with the narrow valleys of the Werra and Fulda, and the fertile basin of the Schwalm in the north. The hills covering its surface include the Taunus and the Westerwald, rising to 2886 feet; the Hohe Rhön, rising in Grosse Wasserkuppe to 3096 feet; the Lahn Mountains, &c. The Thüringerwald traversing Schmalkalden culminates in the Inselsberg (3001). Among the minerals are iron, copper, lead, manganese, and building-stone. It is rich in mineral waters, such as at Wiesbaden, Ems, Kronthal, Homburg, &c. The manufactures include gold and silver wares at Cassel, leather at Eschwege, damasks and other stuffs at Fulda, iron-foundries at Hanau, &c. The population in 1875 was 1,467,898; in 1890, 1,664,426; 1,156,457 being Protestants, 455,332 Catholics, and 44,543 Jews. Of its 108 towns only seven (Frankfort, Cassel, Wiesbaden, Hanau, Bockenheim, Marburg, and Fulda) have more than 10,000 inhabitants each. Hesse-Nassau has a university at Marburg, twelve gymnasiums, thirty-eight 'Real-,' commercial, and higher schools, seven teachers' seminaries, three deaf and dumb and two blind institutes. The principal occupations are agriculture, cattle-rearing, the usual industries, and mining.

Hessian Fly (*Cecidomyia destructor*), a dipterous insect, which in its larval state is one of the most important crop-pests, attacking stems of barley, wheat, and rye. The eggs are usually laid on the leaves twice a year, in May and September, and the larvæ, which hatch in a fortnight, bore into the stem, suck the juices, and destroy the plant. The larvæ turn to pupæ in the end of July,

or in spring, and thence the flies develop in about ten days. The egg is very minute, about $\frac{1}{50}$th of an inch, and pale red towards hatching. The larva or maggot has a shining, oval body, white or yellowish, with a soft fleshy head and twelve segments.



Hessian Fly (*Cecidomyia destructor*):
a, magnified; *b*, natural size; *c*, pupa cases ('flax-seeds') in different stages, natural size and magnified; *d*, barley stem, showing 'flax-seeds' *in situ*; *e*, stem elbowed down. (From Miss Ormerod.)

The mouth parts are very delicate, but near the hind end is a chitinous 'anchor process,' which is probably used as a digger or scraper. The pupa-cases, which are called 'flax-seeds,' are about $\frac{1}{8}$th of an inch in length, of a long oval shape, and of a brownish or chestnut colour. The fly itself is a little stout-made black and brown gnat, about $\frac{1}{4}$th of an inch in length.

The fly was first known as a scourge in North America during the years 1786 and 1789, and owes its name to the erroneous supposition that it was imported by the Hessian troops, mercenaries of Great Britain. In England it appeared in 1788, and was described by Sir Joseph Banks. 'It is now known to exist in the south of France, Austria, Hungary, and southern Russia, and its original habitat is considered most probably to have been southern Europe and western Asia.' In 1886 it occurred in Britain, and in some districts is said to have caused a loss of several bushels per acre. In some years the loss in America has been enormous; as in the years 1790, 1821, 1844–45, 1871–72, 1876–78. Late sowing, 'ploughing in' infested stubble, the use of 'bait' patches of corn, rotation of crops, the selection of strong-stemmed corn, and the like are suggested preventions of the scourge.

See CECIDOMYIA, CORN INSECTS; E. A. Ormerod, *The Hessian Fly* (Lond. 1886); A. S. Packard, 'The Hessian Fly, its ravages, &c.' in *U.S.A. Third Rep. of Entomolog. Comm.* (Washington, 1883); H. A. Hagen, 'The Hessian Fly not imported from Europe,' in *Canad. Entomologist* (1880); B. Wagner, *Die neue Getreide Gall-Mucke* (1861).

Hesychasts (Gr. *hēsychazein*, 'to be quiet'), a mystic and contemplative sect of the Greek Church in the 14th century, who may be described as the Quietists of the East. A Basilian monk, named Barlaam, a native of Calabria, in the course of a visit to the monasteries of Greece, observed among the monks of Mount Athos several practices and doctrines which he considered grievously reprehensible, but one in especial. Believing that in the soul lay hidden a certain divine light, which it was the office of contemplation to evoke, the monks withdrew at stated times to a retired place, seated themselves on the earth, and fixed their eyes steadfastly on the centre of the stomach (whence the soubriquet by which they were known, *omphalopsychoi*, 'navel souls'); and they averred that, after the allotted time of contemplation, a kind of heavenly light beamed forth upon them from the soul (whose seat, they held, was in that region), and filled them with ecstasy and supernatural delight. The monks were defended by Gregory Palamas, the Archbishop of Thessalonica; and councils in 1341 and 1351 pronounced in their favour. But the public voice was hostile to the sect, and they soon fell into obscurity. See Stein's monograph (Vienna, 1874).

Hesychius, a Greek grammarian of Alexandria, flourished probably towards the end of the 4th century A.D. He was the author of a Greek lexicon, containing words and phrases, obscure, rare, and dialectical, which, in spite of the corruption of the text, is one of the most useful books we have for understanding the works of the great classic writers of Greece. The best edition is that published by Alberti and Ruhnken (1746–66; with additions by Schow, 1792).—HESYCHIUS of Miletus wrote a work on eminent Greek writers, and a universal history (mostly lost) down to 518 A.D. See Orelli's edition (1820).

Hetairai, or HETÆRÆ (Gr., 'female companions'), the courtesans of Athens, who enjoyed a social standing not elsewhere accorded to them, were often women of high culture, and exercised great influence. See ASPASIA, LAIS, PHRYNE.

Hetairists. See YPSILANTI.

Heterocercal (Gr. *hetĕros*, 'unequal,' and *kerkos*, 'tail'), Agassiz' term for the tail of Elasmobranch and most Ganoid fishes, in which the vertebral axis is bent upwards in the tail, making the upper lobe much the larger (see the article STURGEON). In bony fishes also the axis is somewhat bent upwards in its termination, but the asymmetry is disguised, and the tail looks equal-lobed or *homocercal*. In some Teleosteans and Ganoids, in a few Elasmobranchs, and in Dipnoi, the tail is genuinely symmetrical or *diphycercal*.

Heteropoda, pelagic Gasteropods, in which the 'foot' has become a swimming organ. In association with their active life on the surface of the ocean must be noted not only the locomotor foot, but the protective transparency, the highly-developed nervous system and sensory structures, eyes, ears, and smelling organ. The toothed ribbon in the mouth is also very elaborate. Technically the Heteropods are included among the Azygobranchs. Atlanta, with a large visceral dome and shell; Carinaria, with a reduced hump and small cap-like shell; and Pterotrachea, without a hump or shell, are the three types. See GASTEROPODA, MOLLUSCS.

Heteroptera. See HEMIPTERA, WATER-BUG.

Hetman, or ATAMAN, the title of the head or general of the Cossacks (q.v.).

Hevelius (whose real name was HOVEL or HOVELKE), JOHANN, German astronomer, was born at Danzig, 28th January 1611, and died in that city, 28th January 1687. He was wealthy, and in 1641 he erected an observatory in his own house, and for forty years carried on astronomical observations therefrom. He wrote descriptions of the phases and spots of the moon, conducted numerous researches on comets, and prepared charts of the moon and of the heavens. He laid down the results of his observations in *Selenographia* (1647), *Cometographia* (1668), and *Machina Cœlestis* (1673; reprinted, with an English trans. by Prince, in 1882), besides minor works.

Heves, a town of Hungary, 60 miles ENE. of Pesth. Pop. 6698.

Hexachord, in modern music, denotes the six diatonic degrees of which Guido formed his scale. See GUIDO, and SCALE.

Hexagon (Gr. *hex*, 'six,' and *gonia*, 'angle'), a figure of six sides and six angles; when the sides and angles are equal it is called a *regular hexagon*. Of the three figures which can completely occupy space (the equilateral triangle, square, and hexagon) the hexagon contains the greatest area within a given perimeter, the proportions between the three different figures being nearly as the numbers 4, 5, 6. It is thus that bees, by making their cells of a hexagonal form, enclose the greatest space with the least expenditure of wax. See BEES.

Hexahedron, a solid figure bounded by six faces—the cube being one inch.

Hexameter, the name applied to the most important form of classical verse. It is the heroic or epic verse of the Greeks and Romans, the grandest examples of which are the *Iliad* and *Odyssey* in Greek, and the *Æneid* in Latin. It consists, as its name implies, of six feet or measures, the last of which must be a spondee (a measure composed of two long syllables), and the penultimate a dactyl (one long syllable and two short). If the penultimate is also a spondee, the verse is said to be spondaic. Klopstock, Goethe, and Voss have produced admirable specimens of hexameter verse in German; and it has become familiar in English through Longfellow's *Evangeline*, Kingsley's *Andromeda*, and Clough's *Bothie of Tober-na-Vuolich*. The following lines from the last show the only varieties of the hexameter which are endurable to the ear i.e. those in which the accent on each foot falls on its first syllable:

Fell he in myrtle | sprigs her | scarves | far in the meadows.
Stunned she | heeding, | leaving | reaps, | full cut | flowing.

It will be observed that on whatever syllable here the metrical accent falls, that syllable is precisely the same which the voice naturally accentuates. Whether this was the case in ancient Greek and Latin hexameters we do not know, but, if the present system of Greek accentuation represents the natural accent of Homeric words, it is certain that Homer disregarded the natural accents, or did not observe our rule of always placing the metrical accent on the first syllable of each foot; and we still pronounce Latin hexameters by preserving what we take to be the natural accent of each word, whether that corresponds to the metrical accent or not. Thus in the line

Ítaliam fáto profugús Lavíniaque | vénit

we disregard the metrical accent, which should fall on the first syllable of each foot (and actually does so in the fifth and sixth), and in reading the line give effect to the natural accents only, as we conceive them, of the words *Italiam, fato, profugus*. Professor T. Arnold, in the appendix on metres in his *Manual of English Literature*, points out that when English hexameters were first written they were constructed in the same manner; they were to be read in the same way as Latin hexameters. The natural accent, except in the last two feet, overruled the metrical. In the following lines from Stanihurst's translation of the *Æneid* it will at once be seen that the effect is absurd if we read the lines as modern English hexameters are read:

Either lets | are couch | ing some | troops of Grecklish as | sembly,
Or to crush | our hul | works this | work is | forged, all | houses
For to pry, | surmount | ing the | town, some | practice or | other.
Here lurks | of evn more; | trust | not this | treacherous | ensign.

If we read by the natural accent the effect is rough and harsh to the ear; if by the modern metrical, ridiculous and absurd. Such are the limitations of the hexameter in English.

Hexapla (Gr. *hexapla*, 'the sixfold'), a celebrated edition by Origen of the Old Testament Scriptures, consisting of the Hebrew text, with a transcript in Greek letters, the Septuagint, and the versions of Aquila, Symmachus, and Theodotion. It is no longer extant. See ORIGEN, SEPTUAGINT.

Hexham, an ancient town of Northumberland, beautifully situated on the right bank of the Tyne, 24 miles W. of Newcastle by rail. A stone bridge of nine arches spans the river, and the town is intersected from east to west by one long street, called in its different parts by the names of Priestpopple, Battle-hill, and Hencotes. Two narrow streets connect with the market-place, one of the most interesting and picturesque in England, from which again other narrow streets diverge irregularly. The great point of interest is the Abbey Church of St Andrew, a noble monument of 13th-century architecture, of which the greater part of the choir, except the eastern chapels, and both the transepts alone remain, the building having been subjected to shameful restoration in 1858, and again in 1869. The monastery was originally founded by St Wilfrid in 674, and his church was long celebrated by the chroniclers as the finest on this side the Alps. Here in 681 a bishopric was established which lasted till 821, when Tidferth, the last bishop, died on a voyage to Rome, having been driven off by the Danes. The ruined church was rebuilt in 1112, and a priory of Austin canons founded, but the monastery was suppressed under Henry VIII., and its last prior hanged at Tyburn for taking part in the Pilgrimage of Grace. The nave of the church was destroyed by the Scots in 1296, and was never rebuilt. Under its ruins was discovered the Saxon crypt of St Wilfrid, a wonderful survival of our earliest architecture, with strange barrel vaults, lamp niches, and funnel-shaped apertures, only to be matched at Ripon. It has been discovered that it was built of Roman stones, most likely carried from the old Roman station of *Corstopitum*, but 3½ miles distant. The central tower is 100 feet high, and of its eight ancient bells one is still called the 'Fray Bell,' from having been rung to give warning in Border alarms. The stone Frith-stool is supposed to have been Wilfrid's chair. The best remains of the monastery are the refectory and the abbey gateway of Norman architecture. To the west of the churchyard is the Seal, once the park of the monks, now a public promenade. Near Hexham the Lancastrians were severely defeated, May 15, 1464. The chief manufactures of the town are gloves and hats. Pop. (1871) 5331; (1881) 5919; (1891) 5945.

See Wright's *History of Hexham* (1823); *The Priory of Hexham, its Chroniclers, Endowments, and Annals*, edited for the Surtees Society by James Raine (1864–65); Hewitt's *Handbook to Hexham and its Antiquities* (1879); and especially the admirable and sumptuous work by Charles Clement Hodges, *The Abbey of St Andrew, Hexham* (privately printed, 1888).

Heylin, PETER, an English divine of considerable note in his own day, was descended from an ancient Welsh family belonging to Montgomeryshire, and was born at Burford, in Oxfordshire, November 29, 1599. He studied at Oxford, where he took the degree of D.D. Through the interest of Laud (q.v.), Heylin was appointed chaplain-in-ordinary to King Charles in 1629. He was deprived of his livings under the Commonwealth; but after the Restoration was made sub-dean of Westminster. He died May 8, 1662. Heylin was a very voluminous controversial writer on the anti-Puritan side, and wrote cosmographies, histories of England, of the Reformation, and of the Presbyterians. See FULLER, THOMAS.

Heyne, Christian Gottlob, a German classical scholar, was born at Chemnitz, in Upper Saxony, 25th September 1729, the son of a poor weaver. In spite of extreme poverty and often absolute hunger, Heyne struggled perseveringly at Leipzig; and in 1753 he obtained the situation of under-clerk in the Brühl library at Dresden. An edition of *Tibullus* and one of the *Enchiridion* of Epictetus, which he published about this time, gained for him the patronage of the celebrated scholar, Ruhnken of Leyden. But the outbreak of the Seven Years' War threw Heyne out of employment, and for some time he led a precarious life, being often without bread, and supporting himself as best he could by writing for booksellers. But in 1763, on the recommendation of Ruhnken, he was appointed professor of Eloquence at Göttingen, and the rest of his long life was spent in comfort and professorial activity. By his lectures and the thorough knowledge he displayed of all departments of ancient Greek and Roman life, he was chiefly instrumental in raising Göttingen to its pre-eminent position as a school of classical study. He is said to have trained more than 130 professors. Heyne died 14th July 1812. His principal works, besides those mentioned, are his editions of Virgil (1767; new ed. 1830–44), Pindar (1773), Apollodorus (1782), and Homer's *Iliad* (8 vols. 1802); numerous translations; six volumes of *Opuscula Academica* (1785–1812); and about 7500 reviews of books in the *Gottinger Gelehrte Anzeigen*, of which he was editor from 1770. Compare the Life of Heyne by his son-in-law, Ludwig Heeren (1813), and Carlyle's essay in vol. ii. of the *Miscellanies*.

Heyse, Paul Johann, German poet, dramatist, and novelist, was born in Berlin on 15th March 1830, and educated at Berlin and Bonn. He was one of the band of writers whom King Max of Bavaria gathered around him in Munich in 1854. Freed from the necessities of earning a livelihood, Heyse has developed an astonishing productiveness. As a writer of novelettes he is an acknowledged master, his work in this department being mostly of the nature of genre-pictures in words. He is not wanting in sly humour, exhibits considerable executive skill and fertility of invention, shows artistic attention to details, and writes in a graceful style; but his work is frequently marred by sensuousness and immoral feeling. He has published more than a score of collections of novelettes under various titles, good specimens of which are contained in *Das Buch der Freundschaft* (1883–84). His poetic works include narrative poems, such as *Urica* (1852), and epics, such as *Die Braut von Cypern* (1856) and *Thekla* (1858). As a dramatist he has been almost as voluminous a writer as in the domain of novels; but few if any of his dramatic pieces have been unequivocally successful. He has also written a couple of more ambitious novels, *Die Kinder der Welt* (1873; 7th ed. 1880) and *Im Paradiese* (1875; 5th ed. 1880), which have been very warmly praised. Nor is his industry yet exhausted; he has translated the poetical works of Giusti (1875), of Leopardi (1874), and of Parini, Monti, and Manzini (1889).

Heywood, a municipal town of Lancashire, 3 miles E. of Bury and 9 N. of Manchester. It is connected with the Rochdale Canal by a branch canal, and is on the Lancashire and Yorkshire Railway. Incorporated in 1881, Heywood has increased with great rapidity, both in population and wealth, since the beginning of the 19th century, partly in consequence of extensive coal-mines in the neighbourhood and partly in consequence of the enterprise of the Peel family, who introduced there the cotton manufacture. Iron and brass founding, boiler-making, and the manufacture of cotton, woollens, machinery, railway plant, and chemicals are carried on. The Free Libraries Act was adopted in 1873; and the Queen's Park, 20 acres in extent, was opened in 1879. Pop. (1851) 12,194; (1881) 22,979; (1891) 23,286.

Heywood, John, the epigrammatist, was born near St Albans about 1497. After his studies at Oxford he was introduced at court by Sir Thomas More, and soon made himself by his merry wit and his skill in music a favourite with Henry VIII., and later with Mary. He was a devout Catholic, and on the accession of Elizabeth betook himself to Malines, where he died in 1580. He wrote several short plays which he called interludes. The name had hitherto meant short dramatic pieces performed in the intervals of a banquet or court-pageant, in which the characters were merely personified qualities, but Heywood introduced the novelty of making these individual persons represent classes, as the Pedlar, the Pardoner, and the like, instead of Youth, Felicity, &c. His interludes thus form an important stage between the old moralities and the modern drama. Among them are *Johan, Tyb his wife, and Sir Johan the preste; A Mery Play betwene the Pardoner and the Frere, the Curate and Neighbour Pratte;* and *The Play called the four P's, a new and very Merry Interlude of a Palmer, a Pardoner, a Poticary, and a Pedlar.* His three collections of *Epigrams* reach the number of six hundred. His longest work is the wearisome allegorical poem, *The Spider and the Fly*, in which the relative merits of Catholics and Protestants are contrasted.

Heywood, Thomas, dramatist and actor, a Lincolnshire man, was educated at Cambridge. He seems to have been writing plays as early as October 1596; and on 25th March 1598 he was regularly engaged by Philip Henslowe as an actor. Of all the old dramatists he was the most prolific. We learn from the preface to *The English Traveller* that down to 1633 he had 'had either an entire hand, or at the least a main finger,' in the composition of 220 plays; and he continued for some years after that date to write for the stage. He was also the author of an historical poem, *Troja Britannica* (1609, folio); an *Apology for Actors* (1612); *Nine Bookes of Various History concerninge Women* (1624); a folio of nearly five hundred pages, which was planned, written, and printed within the space of seventeen weeks; a long poem, with learned and curious annotations, *The Hierarchie of the Blessed Angells* (1635, folio); a volume of rhymed translations from Lucian's *Dialogues*, Erasmus, Ovid, &c.; various mayoralty pageants, and divers tracts and treatises. His projected *Lives of all the Poets, Modern and Foreign*, was unfortunately never published. In 1624, and again in 1635, he refers to this work; and we know from Richard Brathwait's *Scholar's Medley* that he was engaged upon it as early as 1614. The last of Heywood's publications was *The Life of Ambrosius Merlin* (1641). It is usually supposed, but without sufficient evidence, that he was alive in 1648, when he was mentioned in the *Satire against Separatists*.

Twenty-four of Heywood's plays have come down. The best is *A Woman kilde with Kindnesse* (1607), a pathetic tragedy of domestic life; and with this may be coupled *The English Traveller* (1633), which contains some admirable scenes, but ends somewhat abruptly. Heywood was particularly successful in depicting blameless English gentlemen, such characters as Master Frankford in the earlier play and young Geraldine in the later. His work is usually distinguished by naturalness and simplicity; but he wrote at the beginning of his career one absurdly grandiose play, *The*

Foure Prentices of London, printed in 1615, which was parodied in Beaumont and Fletcher's *Knight of the Burning Pestle*. In the two parts of *The Fair Maid of the West* (1631), and in *Fortune by Land and Sea*, partly written by William Rowley and first printed in 1655, he gives us some spirited descriptions of sea fights. *The Four Maids of the Exchange* (1607), a sentimental comedy, has a very improbable plot; *The Rape of Lucrece* (1608) is chiefly noticeable for its songs; *Love's Mistresse* (1636), dealing with the story of Cupid and Psyche, is fanciful and ingenious; and there is much tenderness in *A Challenge for Beautie* (1636). In the Four Ages—*The Golden Age* (1611), *The Silver Age* (1613), *The Brazen Age* (1613), and the two parts of *The Iron Age* (1632)—Heywood dramatised classical mythology, 'from Jupiter and Saturn to the utter subversion of Troy. These plays are undeniably tedious, but contain some charming poetry. *The Late Lancashire Witches* (1634), written in conjunction with Richard Brome, is largely of a farcical character; and *The Wise Woman of Hogsdon* (1638) exposes the trickeries of fortune tellers. In *The Royall King and Loyall Subject* (1637) the doctrine of passive obedience to kingly authority is carried to extreme lengths. The early plays, *Edward IV.* (2 parts, 1600) and *If You know not Me You know No Bodie; or, the Troubles of Queen Elizabeth* (1605–32), are of small account; nor can much be said in favour of *A Maydenhead Well Lost* (1634). *The Captives, or the Lost Recovered*, an interesting play acted in 1624, was first published in 1885 from Egerton MS. 1994 (Bullen's 'Old Plays,' 1st series, vol. iv.). A collection of Heywood's plays, in six volumes, was issued in 1874 (London, John Pearson). In tragic power he was deficient, but his gentleness and sincerity endear him to students.

Hezekiah (Heb. *Hizkiah*, *Yehiskiyahu*, 'May Jehovah strengthen him'), a reforming king of Judah, son and successor of Ahaz, reigned from 728 to 697 B.C. His reign is remarkable for the invasions by the Assyrians under Sargon, and again under Sennacherib. When Sennacherib appeared before Jerusalem 'an Angel of the Lord' (explained variously to mean the plague, an earthquake, a sudden attack by Tirhaka, or the simoom) slew during one single night 180,000 men in the Assyrian camp, and Sennacherib was obliged to retreat. (See 2 Kings, xviii.–xx., and 2 Chron. xxix.–xxxii.) The events of this period as recorded in Assyrian records are treated at Assyria (q.v.). After the war he collected great treasures and executed many highly useful works, among which the aqueducts of Jerusalem take a foremost place. His was also the golden age of prophetic poetry. He was succeeded by his son Manasseh.

Hiawatha, the name by which the Iroquois call a personage of miraculous birth (elsewhere amongst the North American Indians known as Michabou, Chiabo, &c.) sent amongst them to clear the rivers and forests, and teach the arts of peace. Longfellow's poem (1842) is based on Schoolcraft's version of the tradition ('Algic Researches,' 1839; republished as *The Myth of Hiawatha*, 1856).

Hibbert Lectures, a foundation instituted by the trustees of Robert Hibbert (1770–1849), a West India merchant. For many years the trustees applied the funds mainly to the higher culture of students for the Unitarian ministry, but in 1878 resolved to institute Hibbert Lectures, with a view to capable and really honest treatment of unsettled problems in theology, apart from the interest of any particular church or system. Amongst the lecturers have been Max Müller, Page Renouf, Renan, Rhys Davids, Kuenen, Beard, Reville, Pfleiderer, Rhys, Sayce, and Hatch.

Hibernation (Lat. *hibernare*, 'to pass the winter'), a physiological term employed to describe the habit which certain northern, and most probably some Antarctic mammals, reptiles, fishes, insects, and molluscs have of passing part of the year, almost invariably the coldest winter months, in a more or less continuously torpid condition, from which they revive either at irregular intervals, or altogether on the return of warm weather. Hence the Germans express this condition by the word *winterschlaf* ('winter sleep') in contradistinction to *sommerschlaf*, 'summer sleep' or æstivation, an analogous, though not identical, trait of some southern animals during the summer months.

As far as mammals are concerned, the following are the principal facts established: (1) All northern species, even those which find food scarce during winter, do not hibernate, nor do all the species of the same family, order, or genus. Even both sexes of the same species do not always agree in this respect. The bear, the badger, the dormouse, the hamster, the bat, the marmot, the zizel, and the hedgehog are among the best known and most pronounced hibernators. But while all the burrowing marmots, whistlers, woodchucks, ground-hogs, &c. are more or less complete hibernators, the alpine marmots (*Arctomys marmotta*) indulge in this habit by fits and starts. The sloth bear (*Melursus labiatus*) and other Indian Ursidæ differ from the other members of their family in remaining awake during winter, though they are sluggish during this season, moving about very little, and then only occasionally when they require food; and both the black and brown bear of the Rocky Mountains and the polar bear are strict hibernators only as regards their females, the male being often seen at large between November and May. Most of the American squirrels differ from the European species in being non-hibernating. (2) The same animal may vary in this respect in different portions of its range. Thus, though the American skunks are in the northern part of the region over which they roam more or less complete hibernators, they get more and more wakeful as their range extends equatorially, until in the most southern part of it they move about freely at all seasons of the year. In like manner, the prairie 'dog,' or marmot (*Cynomys ludovicianus*), in the northern plains retires to sleep during severe weather, as do also the woodchucks of the same region, but in open winters and on pleasant days they display no such tendency; while in the extreme southern limits of their range they are not hibernators at all. (3) They do not all retire at the same time. Most of the true hibernators take to their 'hibernaculum,' or winter hole—a burrow, a hollow tree, a cave, the eaves of a house, or similar situation—in late autumn, varying the date slightly according to weather. But the great bat (*Scotophilus noctula*) is rarely seen after September, and often retires as early as the end of July, when its insect food is abundant. (4) All of them do not sleep the same length of time, or with the same torpidity, and several indulge in hibernation and waking alternately during the winter. The squirrel, in Britain, lies dormant most of the cold season; but on sunshiny days it often wakes, visits its hoards of food, eats freely, and then retires to rest again. The hedgehog is sometimes seen during the winter; and on sunshiny days the common bat often emerges from its hibernaculum, and flits about even when snow is on the ground. The dormouse also at intervals wakes up, eats, and goes to sleep. Other animals, like the long-tailed field-mouse, pass the winter in a drowsy state not far removed from dormancy. There are thus all gradations between continuous winter dormancy

and the ordinary daily sleep of a few hours in which every animal indulges. There is also every degree of torpidity exhibited. The hedgehog and the dormouse may be rolled over and over like a ball, without waking, and the black bear of America is extremely difficult to arouse out of its winter sleep. On the other hand, the brown bear of Siberia hibernates lightly, and is very dangerous when awakened. The hedgehog, if disturbed, takes a 'deep sonorous inspiration, followed by a few feeble respirations, and then by total quiescence.' This differs from the stirring and then coiling itself up again which is the animal's way when awakened out of an ordinary sleep. But, though sensation and volition are dormant, the reflex and excito-motory actions are keen, the slightest touch applied to the spines of a hedgehog or to the wings of a bat inducing one or two inspiratory movements. But the hibernating badger is not difficult to reawake, and in its torpor, like all hibernating animals, is not rigid. (5) Continuous hibernators do not lay in stores of food. Intermittent winter-sleepers generally do, while some animals which are not true hibernators, but remain only drowsy during the winter, retire to their burrows to pass the days of famine above ground in the midst of their abundant nuts and other provender. All of these food-storers are vegetable-eaters. The arctic fox is indeed the only exception to this rule, for though it is not any more than the beaver a hibernator, it hoards up dead lemmings, ermines, geese, hares, &c. against the evil days of winter. An exception to intermittent hibernators being thus provident is afforded by the porcupine (*Hystrix cristata*) and the alpine marmot.

In its most pronounced forms hibernation differs physiologically in several important steps from ordinary sleep, though it is undoubtedly linked with this function by a regular chain of links. Cold we know produces drowsiness, which ends in a fatal torpor, and on warm days a sleep steals over the eyes which might, in kind if not in degree, be compared with the æstival torpor of some animals. In other respects, hibernation is more akin to trance. Yet what is most puzzling about it is that it affects only some animals which differ little in habit from others which keep awake all winter, and in the same region find food in abundance. The polar bear sleeps while seals are plentiful on the ice-floes, and the Noctule bat retires while the cockchafers, in which it delights, are numerous. Still, as it enables animals to live within their area which might otherwise require to migrate, we cannot refuse to admit that hibernation plays an important part in the struggle for existence, the survival of the fittest, and the means whereby animals are confined within certain zoo-geographical regions. But how it originated, or whether it is a survival, like migration, from a former condition of things, are problems which in the present state of our knowledge cannot be satisfactorily solved.

Hibernators, when they retire for the winter, are unusually fat: when they emerge from their hibernaculum they are unwontedly lean. They all try to keep warm, the heat of their body being nearly that of their hibernaculum. Yet if exposed to greater cold they revive, and, if the temperature is still further lowered, like other animals they freeze to death. Reviviscence is probably due to the calls of nature, the observations of Horvath on a zizel (*Spermophilus citillus*) showing that the heat of the circumambient air does not rise while the animal is awaking, though the temperature of its body does. During dormancy the animal functions are all but suspended. Excretions in the bat are reduced to almost nothing, and the bears close the lower end of their alimentary canal by a resinous plug, known in Sweden as 'tappen.' Respiration and circulation are reduced to a minimum. The air of a closed jar containing a hibernating dormouse is unaltered. Others can survive long in an atmosphere deprived of oxygen. A bat in a lethargic condition has remained sixteen minutes under the water; and though three or four minutes' immersion will, under other circumstances, suffice to drown a hedgehog, in a state of winter torpidity it can bear twenty-two and a half with impunity (Marshall Hall). Carbon dioxide has so little effect on a torpid marmot that one lived after being four hours in this poisonous gas. Simon and Friedleben noticed that in some hibernators the thymus gland gets laden with fat just before they retire for the winter, and Barkow has described a portion of this as the 'hibernating gland.' In this special organ, he claims, the fat is transformed into a store of animal starch and sugar, by which the heart and muscles are fed during the period of torpidity. But his observations have not been confirmed, this gland not existing in all hibernators; nor is it at all certain that such is its use. Moreover, contrary to his assertion, hibernators do lose weight, often to the extent of 30 and 40 per cent., in this respect resembling starving animals.

Hibernation in other animals has not been so closely studied. All reptiles and batrachia become torpid during cold weather, snakes passing the winter in tangled knots as if for warmth: if the viper is aroused at this season its venom is said to be inert. Alligators creep into holes in the river-banks, and frogs lie dormant in the mud at the bottom of ponds. Many fishes (carp, roach, chub, minnows, eels, the Mediterranean muræna, &c.) also retire into some deep recess, or into the mud, though their condition at this period is not that of the true hibernators. Their vitality only is lowered. In winter all land-snails hibernate by closing the mouths of their shells with a plate (the epiphragm), leaving only a little hole in the middle of it for breathing. Slugs also become torpid in holes in the ground, and the fresh-water mussels (Unio, Anodonta, Dreissena) bury themselves in the pond and river mud until the cold months are over. The torpidity of insects in the pupa and other stages is well known. Individuals belonging to the Vanessa group of butterflies which hibernate in the *imago* stage occasionally emerge during mild winter days. But hive-bees do not hibernate, food being necessary for their subsistence during the flowerless season.

Hibernia. See IRELAND. For the Hibernian School, see ROYAL MILITARY ASYLUM.

Hibiscus, a genus of plants of the natural order Malvaceæ, the type of a tribe or sub-order distinguished by a double calyx and fruit of three or more many-seeded carpels united into a many-celled capsule. The species are numerous, natives of warm climates, some of them trees or shrubs, but most of them large herbaceous plants, annual or perennial. The flowers of many are very beautiful; in the South Sea Islands they are much used for personal adornment. *H. syriacus*, sometimes

but erroneously called *Althæa frutex*, a native of Syria and Carniola, has long been in cultivation as an ornamental shrub, and proves sufficiently hardy in many parts of Britain. Many are favourite hothouse plants. The characteristic mucilaginous and fibrous properties of the Malvaceæ are very strongly developed in this tribe. The fruit of *H. esculentus*, or *Abelmoschus esculentus*, is in general use both in the East and West Indies as an article of food; its name in the West Indies is Gobbo. It is an annual plant, with a soft herbaceous stem, 3 to 5 feet high, crenate leaves, axillary sulphur-coloured flowers, and pyramidal, somewhat podlike capsules. It is cultivated in some parts of the south of Europe.

Hibiscus esculentus, upper part of a flowering plant:
a, unripe fruit; *b*, section of do.
(Bentley and Trimen.)

The fruit is used in an unripe state. It is generally much esteemed, but is disliked by some on account of its viscidity. It enters, as an important ingredient, into the *pepper pot* of the West Indies. The ripe seeds are sometimes used in soups as barley. The bark of *H. tiliaceus*—a tree 20 feet high, with a very thick hole—abounds in mucilage that by chewing it the natives of the South Sea Islands obtain nourishment in times of scarcity. This tree is one of the most abundant trees of the South Sea Islands; and the wood, being light, tough, and durable, is much used for many purposes. From its fibre the Tahitians manufacture matting fine and coarse, the latter for sleeping upon, the former for protection from wet during the rainy season, and they also make ropes and twine of the same. The bark is very fibrous, and cordage and matting are made of the fibre in various tropical countries. Many other species yield fibres, some of them coarse, some of them fine and beautiful, which are used in different countries; but the most important in this respect is *H. cannabinus*, the Deccan Hemp of western India (see FIBROUS SUBSTANCES). *H. sabdariffa* is very generally cultivated in warm countries, on account of its calyx, which, as the fruit ripens, becomes fleshy, and acquires a very pleasant acidity. It is much used for making tarts and jelly, and a decoction of it, sweetened and fermented, affords a refreshing beverage, well known in the West Indies as *Sorrel Cool Drink*, the plant being called Red Sorrel; and in the Madras territories it is used for similar purposes, and is named *Rozelle* or *Rousselle*. *H. Abelmoschus* (or *Abelmoschus moschatus*), sometimes called Musk Seed, another plant common in widely separated tropical countries, is cultivated for its seeds, which have a fragrance between that of musk and that of amber. They are much used by perfumers, and are called *Ambrette* or *Graines d'Ambrette*. In Egypt and Arabia they are mixed with coffee, and stimulant and stomachic qualities are ascribed to them. The petals of *H. Rosa-Sinensis* possess astringent properties, and they are also used by the Chinese to stain their eyebrows and their shoes black.

Hiccup, or HICCOUGH, is caused by an involuntary contraction of the Diaphragm (q.v.), while the glottis is spasmodically closed. The inward current of air through the narrowed aperture, and its sudden arrest when the glottis closes, cause the characteristic sound. Usually the paroxysm only lasts for a few minutes, but it may sometimes extend to hours or days. The most common cause of hiccup is some disordered condition of the stomach. Very obstinate hiccup sometimes occurs in various diseases, especially fevers and diseases of the lungs and liver; and may be a very serious complication in consequence of the exhaustion it produces. Sometimes it has a nervous origin.

When the attack is slight it may often be stopped by making a very full inspiration, and then holding the breath as long as possible, the diaphragm being thus kept in a state of voluntary contraction. A draught of cold water, a start or blow, or strong pressure round the waist will sometimes give relief. In more obstinate cases a combination of camphor or of opium with chloroform, and the frequent swallowing of small rounded pieces of ice, are perhaps the most efficient remedies. Bismuth, nux vomica, bromide of potassium, and many other drugs have also been recommended.

Hickes, GEORGE, nonjuror and philologist, was born at Newsham, Yorkshire, June 20, 1642. He studied at Oxford, in 1664 was elected Fellow of Lincoln College, and in 1666 took holy orders. In 1676 he became chaplain to the Duke of Lauderdale, whom he accompanied to Edinburgh. In 1678 he received the degree of D.D. from the university of Glasgow, and next year from Oxford. In 1682 he was appointed one of the king's chaplains, and the following year made Dean of Worcester. Refusing at the Revolution to take the oaths to King William III., he was deprived of all his benefices. In 1693 he was sent with a list of the nonjuring clergy to the exiled king at St Germains, and in 1694 was consecrated by a prelate of his own party Suffragan Bishop of Thetford. His publications in controversial and practical divinity are numerous. His greatest work, entitled *Thesaurus Grammatico-Criticus et Archæologicus Linguarum Veterum Septentrionalium*, appeared at Oxford in 1705, 3 vols. fol., and in 1689 he had published a grammar of Anglo-Saxon and Mœso-Gothic. He died December 15, 1715.

Hickory (*Carya*), a genus of trees formerly included among Walnuts (Juglans). The hickories are exclusively North American. They are large and beautiful trees, attaining a height of 70 or 80 or even 100 feet, with pinnate compound leaves. The timber of all of them is very heavy, strong, and tenacious, but decays speedily when exposed to heat and moisture, and is said to be peculiarly liable to injury from worms. Great quantities of hickory are used to make hoops for casks. It is much used for handspikes, and shafts of carriages, handles of axes and golf-clubs, large screws, &c. are made of it. It is greatly esteemed for fuel. The nuts of some of the species are excellent eating, and in flavour resemble walnuts. They are enclosed in husks which split up into four equal valves; the surface of the nut is smooth, with four or more ridges running lengthwise, and meeting, especially in *C. sulcata*, in sharp points at either end.—*C. alba*, the Shell-bark or Shag-bark Hickory, so called from its shaggy outer bark, which peels off in long narrow plates, yields the common *hickory-nut* of the northern parts of the United States. The trunk is slender, and the tree occasionally reaches a height of from 80 to 100

feet. Its compound leaves are often 20 inches long. The nuts have a delicious flavour, and are in considerable request. The shell is thin but hard, the kernel sweet. –*C. sulcata*, the Shell-bark Hickory of the West, is a very similar tree, found from Pennsylvania to Wisconsin.—*C. olivæformis*, a western and southern species, yields the well-known Pecan Nut -in which the internal partitions common to the other hickories with the walnut are lacking. It is a handsome tree of 60 or 70 feet high –in some cases reaching 90 feet. –*C. tomentosa* yields the Mocker Nut, and *C. amara* the Bitter Nut; while the Pig-nut Hickory, also with a bitter nut, is *C. porcina*.

Hicks, Elias, a celebrated American preacher of the Society of Friends, was born at Hempstead, Long Island, March 19, 1748. At the age of twenty-seven he was already a well-known preacher, and for many years he travelled through the States and Canada, receiving no compensation for his labours, and when not preaching labouring on his own farm. He was one of the first in his body to agitate against slavery. An able preacher, he exercised great influence among his co-religionists until his unitarianism, or denial of the divinity of Christ and a vicarious atonement, brought him into disfavour with orthodox Friends; but he published his own views with perseverance, and at the age of eighty still travelled and preached. The result of his labours was a schism of the society into two divisions, popularly known as Orthodox and Hicksite Friends (see Friends). He died at Jericho, Long Island, February 27, 1830. See his *Journal* (Phila. 1828) and *Letters* (1834).

Hidalgo, a word explained as being originally *hijo de algo*, 'son of something,' is the title of a member of the lowest class of Spanish nobility.

Hide, in old English law, denoted a certain area of land, the exact quantity of which is variously given as 60, 80, and 100 acres. According to R. W. Eyton (*Key to Domesday*, 1877), the Domesday hide of land denoted fiscal value, not superficial quantity.

Hides. See Leather.

Hieracium. See Hawkweed.

Hierapolis, two ancient cities of the Orient. (1) Hierapolis, or on coins Hieropolis, was a city of Syria Cyrrhestica, and stood on the high-road from Antioch to Mesopotamia, 14 miles W. of the Euphrates. Under the Seleucid kings this city was an important centre of trade, particularly in cotton and silk. The great temple of Astarte (locally known as *Bambyke* or *Mambog*) was plundered by Crassus in 53 B.C. With the growth and spread of Christianity, Hierapolis gradually lost its importance. Passing into the hands of the califs, it was refortified by Haroun al-Raschid about the beginning of the 9th century. It was captured by Romanus Diogenes in 1068, and was again stormed by Saladin in 1175. Its decay dates from the time of the Mongol invasion.—(2) Hierapolis was the name given to a city of Phrygia, situated between the rivers Lycus and Meander, 5 miles N. of Laodicea. It was celebrated for its hot springs, and for a cave, called Plutonium, whence issued mephitic vapours that proved fatal to life. At Hierapolis, the birthplace of Epictetus, Cybele was much worshipped; and there St Paul founded a Christian church. See *Harper's Magazine*, October 1889.

Hierarchy (Gr. *hieros*, 'sacred,' and *archō*, 'I govern'), the name used to designate the whole sacred governing and ministering body in the church, distributed according to its several gradations. See Orders (Holy), Bishop, Priest, Deacon; also Pope.

Hieratic Writing. See Hieroglyphics.

Hiero I., king of Syracuse, succeeded his brother Gelon in 478 B.C. The most important event of his reign was the naval victory gained by his fleet and that of the Cumani over the Etruscans in 474, which deprived the latter of their supremacy in the Tyrrhenian Sea. Though violent and rapacious, he was a lover of poetry, and the patron of Simonides, Æschylus, Bacchylides, and Pindar. Hiero died at Catana in 467 B.C.

Hiero II., king of Syracuse (270–215 B.C.), was the son of a noble Syracusan named Hierocles. During the troubles which prevailed in Sicily after the retreat of Pyrrhus (275 B.C.) Hiero greatly distinguished himself, and was first appointed commander-in-chief and then elected king of the Syracusans. He joined the Carthaginians in besieging Messana, which had surrendered to the Romans; but he was beaten by Appius Claudius, the Roman consul, and compelled to return to Syracuse. In 263, however, he concluded a peace with the Romans for fifteen years, during which he proved so faithful to his engagements that in 248 peace was permanently established. In the second Punic war Hiero likewise proved himself the faithful ally of the Romans, and supported them with money and troops, especially after their defeat at the lake of Thrasymene. He died in 215, and was succeeded by his grandson Hieronymus. Hiero, by his clemency, wisdom, and simplicity, quite gained the affections of the Syracusans, and his financial arrangements were adopted by the Romans when they subsequently conquered Syracuse. He devoted great attention to the improvement of agriculture, and his laws respecting the tithe of corn, &c. (*Leges Hieronicæ*) were still in force in the country in Cicero's time. He was likewise a patron of the arts, particularly architecture; and Archimedes was his relative and friend.

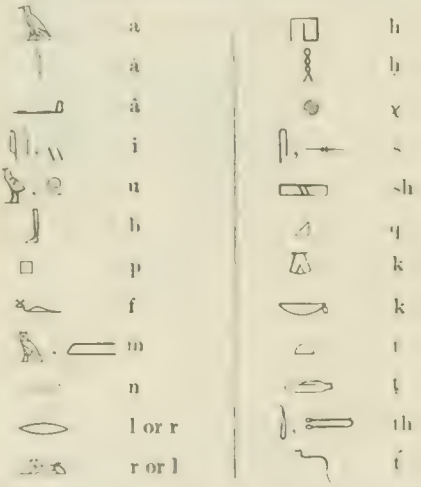
Hierocles, the Neoplatonist, lived at Alexandria about the middle of the 5th century, and enjoyed a great reputation. He is usually reckoned the author of a commentary on the golden verses of Pythagoras (edited by Mullach, 1853). A collection of jests (*Asteia*) used also erroneously to be fathered on him.

Hieroglyphics (literally 'sacred sculptures,' from *hieros* and *glyphō*), a term applied to the representations of objects used to express language, especially those which the ancient Egyptians, Mexicans, and other nations employed for that purpose. The term *hieroglyphs* would, however, be more correctly applied to these figures. The number of those used by the ancient Egyptians was probably about 1700, and by means of them they were enabled to express all their ideas with correctness, clearness, and facility. They consist of representations of figures of men and women and their limbs; quadrupeds, birds, fishes, and reptiles; plants, trees, and flowers; celestial bodies; mountains, islands, stones, water; towns, buildings, rooms and parts of a house; fighting implements and sceptres; articles of furniture; musical instruments; mathematical figures; crowns and baskets; ships and their various parts, &c. Hieroglyphics were inscribed upon granite, basalt, porphyry, and sandstone; they were cut or painted upon wood and plaster; and they were written upon papyri, slabs of calcareous stone, and leather. A reed pen,

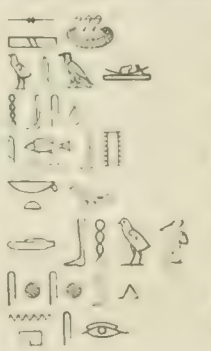
qush, was used for writing upon papyri. The palette used for holding the ink was usually a flat, rectangular piece of wood or ivory measuring about 2½ inches by 12. At one end of this two or more holes were hollowed out for holding ink. The colours most commonly used were black, red, and green; the first was made from vegetable, the second and third from mineral substances.

Inscriptions on Egyptian monuments are sometimes inlaid with colours, an attempt being made to imitate the natural colours of the animals and objects, representations of which are employed to form the inscription. The painted inscriptions which are found upon the inner coffins in the tombs of the 18th and 19th dynasty usually follow a conventional design; the number of colours used upon them being comparatively few, six at the most. But on the Ani papyrus in the British Museum as many as thirteen colours are used. On papyri they are usually drawn in outline in black. The rubrics and initial words are usually written in red. Hieroglyphics are written in horizontal lines or perpendicular columns, which are separated by lines drawn in black ink. Usually they are to be read in the direction in which they face, and are so arranged as to cover completely all the parts of the papyrus which were to be written on. Egyptian hieroglyphics are read in the order in which they are written; this order is sometimes broken for the sake of symmetrical arrangement.

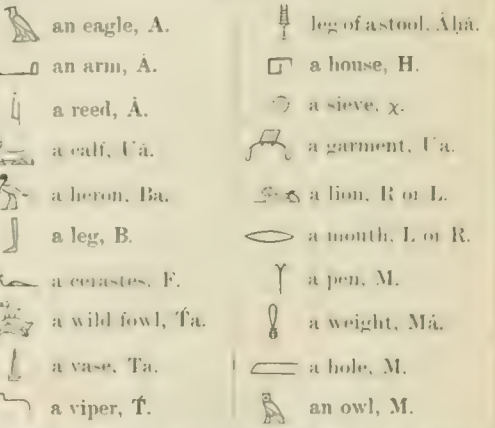
Hieroglyphics are either phonetic or ideographic: the former class comprises signs which represent sounds, and the latter those which represent ideas. Phonetic signs are either alphabetic or syllabic. The hieroglyphic alphabet is as follows:



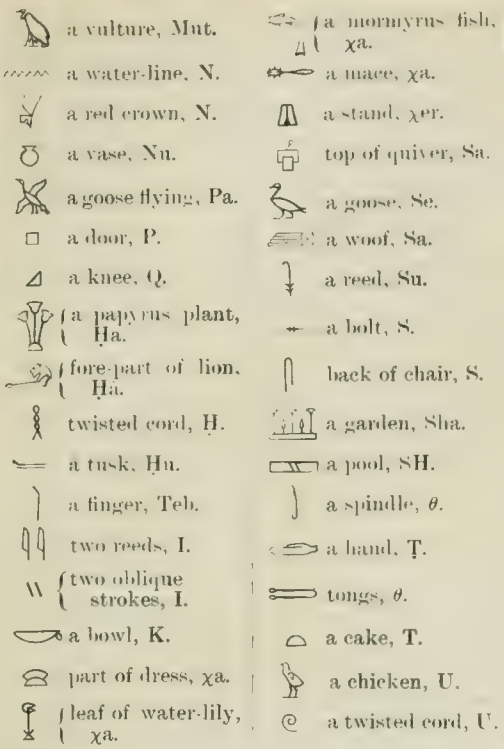
The earliest Egyptian hieroglyphic inscriptions known to us are filled with the alphabetic signs here given; this fact shows that so far back as 3800 B.C. the use of phonetic signs was well known and used. The other phonetic signs have syllabic values. A large number of the hieroglyphics are employed as *ideographs*, or representations of ideas. Every word in Egyptian has one *determinative* or more at the end of it. Thus, after the word for tree we have the picture of a tree, ; and after the word for dog we have the picture of a dog, . An abstract idea, such as joy or gladness, was expressed by the figure of a woman beating a tambourine, or a man dancing, or by the figure of some object possessing it, as , a jackal, to express the idea of cunning or craft; , a seated man, signifying man, was applied to all relationships, functions, and offices of men, as *âtf*, 'father;' *sen*, 'brother;' *mer*, 'governor;' *hen*, 'priest;' *bak*, 'labourer:' the special meaning which it conveyed being shown by the phonetic groups which preceded it. In the same way all beasts, or objects made of leather, were expressed by a skin, ; all precious stones or objects made of the same, by ○; all actions of moving, standing, or stretching, by two legs, ; and all actions in which the idea of strength was to be conveyed, by an arm and a stick, . The number of these signs may be computed at about 150, and they resemble in their use those of the Assyrian cuneiform, in which, although to a more limited extent, the leading classes of thought were determined by a character prefixed or affixed to the phonetic group giving the particular idea. Thus, in the Assyrian, all names of men are preceded by a single upright wedge, ; all countries by ; names of horned cattle by ; and after the names of certain places, Babylon, for example, is affixed. In the Egyptian system, however, the determinatives are always placed after the phonetic groups, and are more numerous. The Chinese system of writing approaches still more closely to the Egyptian, 242 radicals, as they are called, but really determinatives, being placed after other groups and symbols, which indicate the special idea intended. In this last language the radicals are generally placed to the left, except in those instances in which they enclose the phonetic or special groups. In the Egyptian hieroglyphs every word not expressing an abstract idea, such as the verb 'to be,' or the grammatical forms and pronouns, is accompanied by its determinative, and is incomplete without it. The following examples will illustrate the use of determinatives in Egyptian:



SPECIMENS OF ALPHABETIC AND SYLLABIC HIEROGLYPHIC CHARACTERS.*



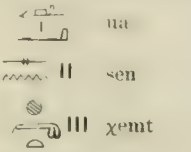
* The first font of hieroglyphic type was cut in England from drawings by the late Mr Bonomi. For the hieroglyphics used in this article we are indebted to Messrs Harrison, printers, London.

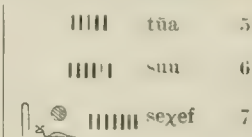


Under the rule of the Ptolemies in Egypt the values of the hieroglyphs were systematically changed. Thus , *χen*, became *m*; , *nes*, became *n*, and so on. The various forms of the same vowel were confused with one another, and many changes between consonants took place.

The *language* of the hieroglyphs is most nearly represented by Coptic. Coptic is a name given to the Egyptian language written with the letters of the Greek alphabet, and a few signs borrowed from the demotic forms of some of the hieroglyphs. The Bible was translated into Coptic early in the 3d century A.D., and the greater part of this work, indispensable for the proper study of the hieroglyphs, has come down to our time. Coptic literature is chiefly theological, and the texts are full of Greek words. The forms of Egyptian words as given in the hieroglyphs are often considerably modified in Coptic; many of the changes are caused by phonetic decay. The Coptic language ceased to be spoken about a century ago. See COPTS.

In Egyptian the noun has two genders, masculine and feminine: feminine nouns usually end in *t*. Plural nouns end in *u* or *iu*, and are generally followed by or . In Egyptian nouns have no declensions, and the cases are expressed by particles placed before nouns. Adjectives have no grammatical forms to indicate degrees of comparison. The following are the principal Egyptian numerals:





The personal pronouns are: *nuk* or *ānuk*, 'I': *entuk* (masc.), *entut* (fem.), 'thou;' *entuf*, 'he.' *entus*, 'she;' *entuten*, 'you' (plur.); *entusen*, *entu*, 'they.' The personal suffixes are *ā*, 'I,' *k*, 'thou (masc.), *t*, 'thou' (fem.); *f*, 'he,' *s*, 'she;' *n*, 'we;' *ten*, 'you;' *sen*, *set*, 'they.' The Egyptian verb has no tenses, moods, voices, conjugations, or personal endings. The exact meaning of a verb must be gathered from the context or the syntax of the sentence. The Egyptian verb is often accompanied by one of the following auxiliary verbs: *ān*, 'be;' *un*, 'be,' 'to arise;' *ārі*, 'do;' *āḥā*, 'stand;' *tā*, 'give.'

Considered as one of the most ancient written languages, Egyptian throws great light upon comparative philology, the relative antiquity of various words and locutions, the general construction of language itself, and the development of picture writing into the abstract ciphers of sound, called letters. During the 19th dynasty, or about 1400 B.C., many Semitic words were introduced into the language by the success of the Egyptian arms in the East, and such words as *bata* for *Beth*, 'a house,' *makaturu* for *Migdol*, 'a tower,' and others, appear; they are, however, rare and few in number compared to the body of the language.

The invention of hieroglyphs, called *Neter kharu*, or 'divine words,' was attributed to the god Thoth, the scribe of the gods, and lord of the hieroglyphs. Pliny attributes their invention to Menon. The literature of the Egyptians was in fact styled Hermaic or Hermetic, on account of its supposed divine origin, and the knowledge of hieroglyphs was, to a certain extent, a mystery to the ignorant, although universally employed by the sacerdotal and instructed classes. To foreign nations the hieroglyphs always remained a mystery, although Moses is supposed to have been versed in the knowledge of them (Philo, *Vita Mogsis*). The Greeks, who had settled on the coast as early as the 6th century B.C., appear not to have possessed more than a colloquial knowledge of the language; and although Solon, 538 B.C., is said to have studied Egyptian doctrines at Sebennytus and Heliopolis, and the doctrines of Pythagoras are thought to have been derived from Egypt, these sages could only have acquired their knowledge from interpretations of hieroglyphic writings. Hecatæus (521 B.C.) and Herodotus (456 B.C.), who visited Egypt in their travels, obtained from similar sources the information they have afforded of the language or monuments of the country. Democritus of Abdera, indeed, about the same period (459 B.C.), described both the Ethiopian hieroglyphs and the Babylonian cuneiform, but his work has disappeared. After the conquest of Egypt by Alexander, the Greek rulers began to pay attention to the language and history of their subjects; and Eratosthenes, the keeper of the museum at Alexandria, and Manetho, the high-priest of Sebennytus, drew up accounts of the national chronology and history from hieroglyphic sources. Under the Roman empire, in the reign of Augustus, one Chæremon, the keeper of the library at the Serapeum, compiled a dictionary of the hieroglyphs; and both Diodorus and Strabo mention them, and describe their nature. Tacitus, later under the empire, gives the account of the monuments of Thebes translated by the Egyptian

priests to Germanicus; but after his time the knowledge of them beyond Egypt itself was exceedingly limited, and does not reappear till the third and subsequent centuries A.D., when they are mentioned by Ammianus Marcellinus, who notes the translation of one of the obelisks at Rome by one Hermapion, and by Julius Valerius, the translator into Latin of the apocryphal life of Alexander, who gives that of another. Heliodorus, a novelist who flourished 400 A.D., describes (iv. 8) a hieroglyphic letter written by Queen Candace. The first positive information on the subject is by Clement of Alexandria (211 A.D.), who mentions the symbolical and phonetic, or, as he calls it, cyriologic nature of hieroglyphics. Porphyry (304 A.D.) divides them also into cœnologic or phonetic and enigmatic or symbolic. Horapollo or Horus Apollon, who is supposed to have flourished about 500 A.D., wrote two books explanatory of the hieroglyphs, a rude, ill assorted confusion of truth and fiction, in which are given the interpretation of many hieroglyphs and their esoteric meaning. After thiswriter all knowledge of them disappeared till the revival of letters. At the beginning of the 17th century these symbols first attracted attention, and about 1650 Athanasius Kircher, a learned Jesuit, pretended to interpret them by vague esoteric notions derived from his own fancy, on the supposition that the hieroglyphs were ideographic—a theory which barred all progress, and which was held in its full extent by the learned, till Zoega in 1787 first enunciated the proposition that the ovals or cartouches contained royal names, and that the hieroglyphs, or some of them, were used to express sounds. More monuments were known, and more correct ideas had begun to dawn on the European mind; and the discovery by the French, in 1799, of the Rosetta Stone, a slab of black basalt, having inscribed upon it, first in hieroglyphics, secondly in demotic or enchorial (a cursive popular form of writing extant at the period), and thirdly in Greek, a decree of the priests of Egypt assembled in synod at Memphis, in honour of Ptolemy V., gave the first clue to the decipherment. The first attempts were made upon the demotic text by Silvestre de Sacy with some success, but it was soon discovered that the demotic was not purely alphabetic. Crude notions of the ideographic nature of the hieroglyphs prevailed till Dr Young, in 1818, first gave out the hypothesis that the hieroglyphs were used as sounds in royal proper names. He was led to this conclusion by tracing the hieroglyphs through the cursive hieratic to the more cursive demotic; and, as this last was known to be alphabetic, he inferred that the corresponding hieroglyphic signs were also alphabetic. In this manner he came to the conclusion that the first hieroglyph in the name of Ptolemy  in the Rosetta Stone (a door) represented a P, the second (hemisphere) a T; the third (a loop) he supposed to be superfluous; the fourth (a lion) he read OLE; the fifth and sixth, the syllable MI; and seventh, the back of a seat, an S. Unaided by bilingual monuments, he essayed to decipher the name of Berenice, and altogether established the value of five hieroglyphs as letters out of two names, but was unable to proceed further. Champollion (q.v.), in 1822, by means of an inscription found on an obelisk at Philæ, which had at the base a Greek inscription, recognised the name of Cleopatra, and by comparison with that of Ptolemy, at once proved the purely alphabetic, not syllabico-alphabetic nature of the signs. Extending the principle, he read by its means the names of the Greek and Roman, and finally those of the native monarchs. It was soon seen that the same hieroglyphs as those employed in these names were extensively used in the texts for words, and these words turned out in most instances to be analogous to the Coptic. Although the discoveries of Champollion were received by many of the learned in Europe with distrust, yet his method of research was slowly adopted by Rosellini and Salvolini in 1832, and subsequently extended methodically by Lepsius in 1837, and by Bunsen, Hincks, De Rouge, Birch, Goodwin, Chabas, Brugsch, and others.

The method of interpretation adopted has been strictly inductive, the value of the characters being deduced from the equation of sounds, or homophones of similar groups. The meaning of the groups or words has been determined by examining all known instances in which they occur in passages capable of being interpreted, that of the ideographs by observing the form of the symbols; many of them have been made out from the pictures which they explain, or the phonetic groups which accompany them. A careful comparison has been instituted with corresponding Coptic forms when they exist. In short, a careful principle of induction has been applied to the study of the hieroglyphs.

The discovery of another trilingual inscription, that of the tablet at San or Tanis, recording a synodical act of the priests in the reign of Ptolemy Euergetes II., 238 B.C., has confirmed the results obtained by Egyptologists, the meaning of almost all the words having been previously determined; while the power of reading all documents and inscriptions afforded by their researches has resulted in the resuscitation of a knowledge of the history, science, and literature of the ancient Egyptians. The study has long passed into the category of a recognised branch of oriental learning, and the researches have assumed a more critical form. This has been owing to the number of students and the abundance of the material which exists. The doubts with which the interpretations were at first received have succumbed to the conviction that nothing but a logical system of interpretation could have obtained such results. Whatever doubt, in fact, may exist as to the minor details and more delicate shades of language, all the grammatical forms and three-fourths of the words of the old Egyptian language have been established.

The hieroglyphs stood in the same relation to the other two forms of the characters, called hieratic and demotic, as type does to handwriting. Their use was chiefly for official inscriptions on public or private monuments, religious formulæ and prayers, and rituals or Hermetic Books (q.v.). The most remarkable hieroglyphic inscriptions are the texts found inscribed upon the pyramids of Pepi, Teta, and Unas; that of Una, recording the conquest of the lands of the negroes at the time of the 6th dynasty; that in honour of Khnumhetp at Benihassan, recording the investiture of his family with the order of the gold collar; the campaigns of Ahmes against the Hykshos at El-Kab; the annals of Thothmes III. at Karnak; the campaign of Rameses II. against the Khita, and the treaty with them; the account of the tanks for gold-washings in the reigns of Seti I. and Rameses II. at Kouban and Redesieh; the invasion of Egypt in the reign of Meneptah by the allied forces of the Libyans and other people of the basin of the Mediterranean; the star-risings on the tomb of Rameses V.; the journey of the ark of Khons to Bakhtan, in the reign of Rameses X.; the account of Cambyses and Darius on the statue of the Vatican; the already-cited synodical act of the priests in honour of Ptolemy Euergetes II.; and that of the priests assembled at Memphis, on the Rosetta Stone, in the reign of Ptolemy V.; the

sepulchral tablets of the family of Pashereniptah, and the long series of sepulchral tablets of the bull Apis found in the Serapeion, recording the birth, installation, and death of the bulls from the 18th dynasty to the Persians.

In connection with the hieroglyphics are two forms of writing them in common use, first the *hieratic* writing, or a cursive form of hieroglyphic. The number of these written characters is fewer than that of the hieroglyphs, the generic determinatives being more employed, and the vocalic complements of the consonants being constantly written in order to distinguish similar forms. This writing was more extensively used than the hieroglyphic, being employed for state papers, legal documents, memoranda, accounts, religious books, rituals, and all the purposes of private and public life. Books were generally written in hieratic. It commences as early as the 4th or 5th dynasty, and terminates only about the 3d or 4th century of our era. At the earliest period it is occasionally written perpendicularly, but it was afterwards only written horizontally, and has generally portions in red ink, corresponding to our initial illuminated letters or rubrics. Many scholars hold it proved that the hieratic alphabet gave rise to the Phœnician, and have traced the Phœnician alphabet from hieratic sources (as in our article ALPHABET, Vol. I., where on page 187 the hieroglyphs, the hieratic characters, and the Phœnician alphabet will be seen side by side). Others still affirm that the precise source of Phœnician writing remains involved in obscurity. The second kind of hieroglyphic handwriting was the *demotic*. It is, like all cursive hands, more difficult to decipher than the hieratic. It was used as far back as the commencement of the 26th dynasty, or the 6th century B.C., and continued in use till the 3d century A.D. This was the last native form of writing in Egypt, the early Christians having introduced the Greek alphabet, with a few characters borrowed from the demotic. This script is rarely used for public monuments, although it appears on the Rosetta Stone; but it was universally employed for contracts, public documents, and occasionally for religious formulæ, owing to the decreasing knowledge of hieroglyphics. At the time of Clement it was the first learned by beginners. With it the Greek language began to appear in public use.

Besides the Egyptian hieroglyphics there are those of the Aztecs or Mexican, which were developed to a stage far above the rude picture-writing of the hunting tribes of American Indians. The system was mainly pictorial, but had made important advances toward attaining phonetic value, especially in the picture-names of persons and places. The simplest kind is where a name meaning 'bird-mountain' is represented by a bird and a mountain; another stage is where a personal name of five syllables is represented by five pictures, each representing a thing whose name corresponds to one syllable of the person's name. After the Spanish conquest, the Franciscans used the Mexican symbols for teaching Christianity. Thus in the Lord's Prayer in Latin, , a flag, pronounced *Pantli*, was used for the syllable *Pa*; , a stone, *Tetl* for *të*, the two expressing *Pater*; , a cactus fruit, *Nochtli*, for *Noch*; and a stone, , as above for *te*: these four groups expressing *Pate*(r) *Nochte*, or *Noster*; and so forth. Some of the missionaries complained of their difficulties when overwhelmed by converted Mexicans giving their confessions written in this puzzling manner. Some have absurdly affirmed, indeed, that all the Mexican manuscripts are monkish impostures. The most important—religious, administrative, historical—are on parchment or on maguey paper. The Toltecan symbols of Central America were different in their method from those of Mexico. —The term hieroglyphic was also used by the writers of emblemata or devices, symbolising Gnomic sentences taken from the Greek and Latin poets, and having no relation to Egyptian hieroglyphs.—In recent times, too, the astrological almanacs have had their symbolical representations and supposed prognostics of future events, which they called hieroglyphs.

Hieronymites, one of the many hermit orders established in the course of the 13th and 14th centuries. The Hieronymites grew out of the Tertiaries or third order of Franciscans (q.v.). Some of the followers of Thomas of Sienna, one of the Franciscan rigorists, having established themselves in various places among the wild districts which skirt the Sierra Morena in Spain, by degrees formed into a community, and obtained in 1374 the approval of Pope Gregory XI., who confirmed their rule, which was founded on that of St Augustine. The institute extended into other provinces of Spain, into Portugal, later into Italy, Tyrol, and Bavaria.

Higden, or HIGDON, RALPH, author of the *Polychronicon*, a general chronicle, in 7 books, detailing events from the beginning of the world to the death of Edward III. Higden's own share in the work is believed to extend down to 1326 or 1327 only, the rest having been written by two continuators. Higden himself was a monk of St Werburgh's monastery in Chester; he is said to have lived there sixty-four years, and to have died in 1364. An English translation of the *Polychronicon* by John Trevisa was printed by Caxton in 1482. This and another early translation, with the text, have been edited for the Rolls series (9 vols. 1865–86) by C. Babington (vols. i. ii.) and Professor Lumby (vols. iii.–ix.).

Higgins, MATTHEW JAMES, English essayist, better known by his principal *nom de plume* of 'Jacob Omnium,' was born at Benown, County Meath, Ireland, on 4th December 1810; was educated at Eton and New College, Oxford; and died at Kingston House, near Abingdon, on 14th August 1868. His intellectual force, his humour and irony were enlisted in the warfare against the abuses and backslidings and minor evils of social and public life, such as the heaping up of legal costs as sung by Thackeray. He wrote no great book, but was a steady contributor to a series of journals, such as the *New Monthly Magazine*, *Morning Chronicle*, *Times*, *Cornhill*, *Edinburgh Review*, *Pall Mall Gazette*, &c. He partien-

lady excelled in the implication of the most pungent meaning in a demure simplicity of statement. He was a man of gigantic stature, 6 feet 8 inches high. A few of his sketches were collected by their author, and printed for private circulation in 1857. They appeared again, with others, as *Essays on Social Subjects*, with a Memoir by Sir W. Stirling Maxwell (1875).

Higginson, Thomas Wentworth, an American author, was born at Cambridge, Massachusetts, 22d December 1823, graduated at Harvard in 1841 and at the divinity school in 1847, and was ordained in the same year. He retired from the ministry in 1858. Meanwhile he had been active in the anti-slavery agitation, and, with Theodore Parker, Wendell Phillips, and others, had been indicted for the murder of a man killed during an attempt to rescue a fugitive slave, but escaped through a flaw in the indictment. In the struggle to make Kansas a free state he took a conspicuous part. In the civil war he rose to the command of the first regiment that was raised from among the former slaves. He afterwards returned to literature, and in 1880–81 was a member of the Massachusetts legislature. His books include, besides histories of the United States, a volume of *Harvard Memorial Biographies*, and a translation of Epictetus, *Out-door Papers* (1863); *Malbone, an Oldport Romance* (1869), and *Oldport Days* (1873); *Army Life in a Black Regiment* (1870); *Atlantic Essays* (1871); *Common-Sense about Women* (1881); a Life of Margaret Fuller (1884); *The Monarch of Dreams* (1886); and *Hints on Writing and Speech-making* (1887).

High Commission Court, a court or judicial committee established in 1559 by Queen Elizabeth to investigate ecclesiastical cases, the members being nominated by the crown. In the reign of James I. disputes arose between the common-law courts and the High Commission as to the powers of the latter. In 1611 Coke decided that it had no right to fine or imprison, save in cases of heresy and schism. Laud employed it freely to enforce uniformity and prevent immorality; but the number of clergy punished by it was never great. In two years of its greatest activity only three were deprived and seven suspended. Complaints were made against this extraordinary tribunal, the counterpart for ecclesiastical persons to the Star Chamber for lay offenders, that it exceeded its powers, and was in itself illegal; and it was abolished by the Long Parliament in 1641. A new court of commission for ecclesiastical cases was established by James II. in 1686, only to be abolished by the Bill of Rights (1689). The High Commission Court established in Scotland in 1608 was abolished in 1638.

High Court of Justice. See Appeal, Chancery, Common Law, Judicature Acts.

Highgate, a northern suburb of London, in the county of Middlesex, 4¼ miles NNW of King's Cross Station by rail. Here Bacon and Coleridge died; Whittington's Stone at the foot of Highgate Hill marks the spot where Dick heard Bow Bells, and turned again; Coleridge's remains, buried in the old churchyard, are now covered by the chapel of the Highgate grammar-school; and in the great cemetery (consecrated 1839) have been buried Faraday, Lord Lyndhurst, 'George Eliot,' and many other famous persons.

Highlands, a term applied to the higher parts of a country, as, for example, Highlands of the Hudson, in the state of New York; but commonly used of a particular district in Scotland. This district has no political or civil boundary. Separated by only a vague line of demarcation from the division called the Lowlands, the Scottish Highlands may be briefly described as that portion of the north and north-west of Scotland in which the Celtic language and manners have less or more lingered until modern times. The Highland line, as it is usually called, extends diagonally across the country from Nairn on the Moray Firth to Dumbarton on the Clyde; but the mountainous part of the counties of Banff, Moray, Aberdeen, Kincardine, and Perth are also understood to be included in the designation Highlands. Caithness might be excluded as being a generally level country; but throughout the Highlands there are rich level tracts, none being more so than the eastern division of Ross-shire. The Hebrides (q.v.) or Western Isles are included in the Highlands, but the isles of Orkney and Shetland, though to the north, are distinctly excluded, by reason of the Norwegian origin of the inhabitants.

The Highlands are full of lofty hills, some green and pastoral with tracts of heath, and others rugged and bare; seven reach a height of 4000 feet and upwards, and nearly fifty are between 3500 and 4000 feet. Besides the grander features, there are impetuous mountain-torrents, picturesque ravines, and valleys or glens, lakes of singular beauty, and fiords, or narrow arms of the sea (like the lakes, called *lochs*). Perhaps the most remarkable feature in the country is the line of valleys from Inverness to Fort-William, in which lies a series of navigable lochs, united by artificial channels to form the Caledonian Canal. Growing up under a system of clanship, the state of society in the Highlands was antiquated and alien, from a national point of view; while the country was almost impenetrable to travellers or to any species of traffic. The first great attempt to reform this state of affairs was the opening up of the country by roads in different directions, under the superintendence of General Wade, about 1725–26. The next great act of melioration was the abolition of Heritable Jurisdictions (q.v.), including the ancient privileges of the heads of clans, about 1748. And lastly, not to speak of the planting of schools and churches, much was done by the establishment of the Highland and Agricultural Society in 1784. Since these events the ancient patriarchal system has given place to improvements as regards communication, agriculture, dwellings, education, and other modern conditions, including a gradual substitution of English for the Gaelic language. Great numbers of the Celtic inhabitants emigrated in the last quarter of the 18th century. An enormous increase of population had arisen with no corresponding increase of food. The mountains were practically waste; the discovery that sheep throve upon those natural pastures led of necessity to the letting of them to such tenants as could supply stock. The half-starving people were at various times dispossessed, and their place taken by stock-farmers with capital from the Lowlands; the 'Sutherland clearances,' which have been the subject of so much controversy, took place between 1810 and 1820. While a new character was thus given to extensive Highland pasturages, the value of estates has been very remarkably advanced by being let for the pursuit of game to sportsmen, chiefly persons of rank and opulence from England. What, therefore, with improved farming and shootings, Highland estates have in the 19th century risen immensely in value. Inverness is usually spoken of as the capital of the Highlands.

The physical geography of the Highlands is discussed under Great Britain; see also Scotland. The clan system is treated at Clan, and the language of the Highlands at Gaelic; see also Celts. The condition of the Crofters and the measures taken for ameliorating it form the subject of a separate article; and Deer-forests are treated under that head. See also Agriculture, for

the Highland and Agricultural Society; Hebrides and articles on the several Highland counties and islands; A. Geikie's *Scenery of Scotland* (2d ed. 1887); Dr James Browne's *History of the Highlands and the Highland Clans* (4 vols. 1838; re-edited by J. S. Keltie, 2 vols. 1875); the guide-books by Anderson, Black, Baddeley, Murray; the Duke of Argyll's *Scotland as it was and as it is* (1887).

Highland Costume. There is little doubt about the antiquity of the 'garb of old Gaul,' although several writers have adopted the theory that the kilt was introduced by an Englishman early in the 18th century. The idea that the kilt is modern seems to have originated with a writer in the *Scots Magazine* in 1798. The original dress of the Highlander was the Celtic *Feile-breacan* (or belted plaid). This was a piece of tartan cloth, 2 yards broad and 4 long, which was drawn round the waist in nicely adjusted folds, and tightly buckled with a belt. The lower part came down to the knees in much the same manner as the modern kilt, while the upper part was drawn up and adjusted to the left shoulder, so that the right arm might be perfectly free. This upper part was the plaid, which was used as a covering for the shoulders and body in wet weather; and when the use of both arms was required it was fastened across the breast with a brooch, often curiously enriched. A brooch was also used to fasten the plaid on the left shoulder. To attire himself in the belted plaid required on the part of the Highlander no small amount of dexterity. The usual way was to lay it on the floor, and after carefully arranging the folds, to lie down upon it, and then buckle it on. The late J. F. Campbell of Islay, who had a kilt and plaid in one made for a fancy-ball at Buckingham Palace, had to adopt this plan—lying down on the outstretched cloth, gathering the folds up and round his waist, and then securing them in position by a belt. The lower end was fastened at the right hip. The same arrangement may be seen in a figure by George Jameson of the Earl of Moray engraved in Lord Archibald Campbell's *Records of Argyll*.

The utility of such a dress in the Highlands is obvious, for the plaid rendered the man indifferent to storms, and prepared to pass a night in the open air in the most inclement weather, while the loose undergarment enabled him to wade rivers or ascend mountains with equal ease. It was thus peculiarly adapted to the warrior, the hunter, and the shepherd. If benighted, the Highlander of old would dip his plaid in water, and then wrap it round him, the woollen cloth swollen with moisture being supposed to resist the wind, while the exhalations from the body during sleep surrounded him with a warm vapour. Heron's *History of Scotland* says that 'in Argyle and the Hebridæ, before the middle of the fifteenth century, tartan was manufactured of one or two colours for the poor; more varied for the rich.' The author of *Certayne Matters concerning Scotland*, who wrote prior to 1597, said of the Highlanders that 'they delight in marbled cloths especially that have long stripes of sundrie colours; they love chiefly purple and blue.' The particular *setts*, or patterns of tartans which distinguish each clan, must have been fixed before 1645, probably before 1600. Martin says that every tribe and every island differed from the rest in the fancy of making plaids, as to the stripes in breadth and colours. Tartans may generally be divided into *green* and *red* according as these colours predominate. The word is held by Skeat to be derived from the Fr. *téretaine*, a kind of linsey-woolsey cloth. Lord Lorne in 1889 discovered at Inveraray old records of the clan Campbell which make frequent mention of tartans; and tartans worn at the battle of Kilsyth (1645) have been seen by living witnesses.

The *Feile-breacan* is now abandoned for the *Feile-beag* (*philabeg* or filibeg) as more convenient. The difference is simply this, that, whereas formerly the lower and upper parts of the dress were attached, they are now separated. The lower part has the folds fixed by sewing, and is known as the kilt, which is probably akin to the Danish *kilte*, 'to tuck up,' though the Gaelic *cealt* means apparel in general. The shoulder-plaid, however, is now worn more for ornament than use.

The original garb of the Highlanders, then, was the *Feile-breacan*, and both in its materials and arrangement it was peculiarly the invention of the Gael. Other articles of the costume were Celtic, and are now peculiar to Scotland, but were not distinctively Highland. The *truis* or 'trews' were worn by gentlemen when on horseback, and occasionally by others, especially old men. They were breeches and stockings in one piece, always of tartan, and made to fit very close to the limbs. General Stewart (1822) said that his grandfather always wore the trews on horseback, and the kilt at home. Then there was worn a waistcoat and short-coat, each adorned with silver buttons, and, in the case of gentlemen, with lace and embroidery. A large purse of goats' or badgers' skin was suspended from the belt, and answered the purpose of a pocket. This was the *sporran*, usually ornamented with silver or brass work and tassels. Brogues and tartan stockings, fastened with broad garters in rich colours; a dirk, with a knife and fork, and sometimes a spoon, stuck in the side of the sheath, and a pair of pistols completed the attire. That of the common people differed only in the deficiency of colours and of silver ornaments. The Highland garb was proscribed in 1747, when it was enacted that any person who should wear the plaid, filibeg, trews, or shoulder-belts, tartans or parti-coloured stuffs, should be imprisoned six months for the first offence, and on second conviction be transported for seven years. This harsh law was repealed in 1782 at the instance of the Duke of Montrose. In this act occurs the first formal record of the 'kilt.'

Gentlemen, says Stewart, wore one or more feathers in the bonnet, and the common people a tuft of heather, pine, holly, or oak. All, however, had the right to a solitary eagle's plume, whereas only the son of a chief could wear two plumes, and a chief of a clan, three. This was the old clan rule.

The plumed bonnet of the Highland regiments, according to Lord Archibald Campbell, who headed the successful opposition to its proposed abolition (1884), is an adaptation from the knights of mediæval Europe. On the island of Inishail, Loch Awe, there is on a tombstone (of 16th century) a figure, with long sweeping ostrich plumes such as those worn by German knights in Dürer's drawings. Similar plumes were also worn by the Earl of Moray in Charles II.'s time, and there are also examples of it in *The Black Book of Taymouth*. Logan says that the Highland soldiers wore short plumes at the side of the bonnet. The head-dress of the first Highland infantry regiment raised was a simple black cap, with a tuft of feathers added in token of gentility and the right to bear arms. From this the feather-bonnet seems to have gradually developed, and is now one of the most cherished distinctions of the Highland regiments. When in 1884 the War Office proposed to abolish it there was quite a storm of indignation aroused, and testimony was produced in abundance that as a military headgear it is light, cool, durable, more serviceable, more economical, and more picturesque than the 'bearskin' of the Guards.

The 'modern' fashion of the kilt (filibeg) is found in armorial bearings of the Burnetts of Leys (1626) and the Mackenzies of Coul (1693). Tartan, as a distinguishing clan-mark, seems to be a survival of totemism. It was so composed that a man could tell to what district, as well as to what clan, the wearer belonged.

See Sketches of the Character, Manners, and Present State of the Highlanders, by Major-general David Stewart. For details of the costume, &c. of the Highlanders, see *The Scottish Gael*, by James Logan; Campbell of Islay's *Tales of the West Highlands*; *The Highlanders of Scotland*, by W. F. Skene; *History of the Highlands, Highland Clans, &c.*, edited by J. S. Keltie; *The Black Book of Taymouth*; *Clan Tartans*, by James Grant (1886), &c. In *The Records of Argyll* and *Waifs and Strays of Celtic Tradition* Lord Archibald Campbell has collected an immense amount of interesting and valuable information bearing upon the whole subject.

HIGHLAND REGIMENTS. The origin of the first of these regiments, the 42d, has been given under the head BLACK WATCH. The valuable services of this regiment encouraged the government to augment the force; and accordingly seven other Highland regiments were soon raised—viz. the 71st in 1777; the 72d, or Duke of Albany's Own, in the same year; the 74th in 1787; the 78th, or Ross-shire Buffs, in 1793; the 79th, or Cameron Highlanders, in 1805; the 92d, or Gordon Highlanders, in 1796; and the 93d, or Sutherland Highlanders, in 1800. In connection with the territorial reorganisation of regiments, the old numerical designations have been dropped, and the battalions linked. Thus the new Black Watch (Royal Highlanders) comprises the former 42d and 73d regiments; the Highland Light Infantry, 71st and 74th; the Seaforth Highlanders, 72d and 78th; the Gordon Highlanders, 75th and 92d; Princess Louise's (Argyll and Sutherland Highlanders), 91st and 93d. The Queen's Own Cameron Highlanders (79th) remain a single battalion regiment. The uniform is the Highland dress, with feather-bonnet. A large proportion of the officers are Scotch; of the men about 79 per cent. are Scotch, 11 English, and 10 Irish.

Highness, a title of honour given to princes, grand dukes, and minor reigning potentates. The title 'Highness' and sometimes 'Kingly Highness' were both used in England for the sovereign until the reign of Henry VIII., when they were superseded by 'Majesty.' The children of emperors are usually addressed as 'Your Imperial Highness,' of kings as 'Your Royal Highness,' whilst members of princely families have the titles of 'Serene Highness' and 'Highness.'

High-priest, the chief of the Jewish priesthood, the dignity being hereditary in the line of Eleazar, the son of Aaron. The high priest was only allowed to marry a virgin, and one who was of his own tribe. Contact with anything unclean, even the dead bodies of his own parents, was strictly forbidden to him. His functions consisted principally in the general administration of the sanctuary and of all that belonged to the sacred service. He alone was allowed to enter the Holy of Holies on the Day of Atonement, and to consult by the Urim and Thummim (q.v.). His costume was of surpassing splendour, purple-red, purple-blue, scarlet, golden, and white being the predominating colours of the ephod, girdle, and breastplate, which he wore above robes of pure whiteness. His revenues were in the main the same as those of the other priests; but, according to the Talmud, he was to be richer than these in virtue of his exalted position, and, if his own means were insufficient, he was to be provided with means by his brethren. This points, however, to post-exilic times, when the high-priest had exchanged his character of *primus inter pares* for that of priestly head of the nation, thereby becoming invested, in so far as the political subjection of the Jews to a foreign power would admit of it, with the prerogatives of ancient kingly power. Nevertheless, in the eyes of the law, the high-priest was only the equal of other Israelites. It is doubtful at what time the office of *Sagan*, or vice high priest, was created. See PRIEST.

High Seas, the open sea, including the whole extent of sea so far as it is not the exclusive property of any particular country. The rule of international law is that every country bordering on the sea has the exclusive sovereignty over such sea to the extent of three miles from its shores; but all beyond, not within three miles of some other country, is open or common to all countries. The part of sea within three miles' distance is generally called the territorial sea of the particular country, or *mare clausum*. The distinction has little effect on the right of navigation, but as regards fishing it is otherwise. Thus, foreign fishermen have no right to fish within three miles of the British coast without a license from the crown, or unless some special treaty has laid down other arrangements. See FISHERIES, COOPERAGE.

High Steward, a title given to several important officers. The peer appointed by the crown to preside at the trial of a peer or peeress for treason or felony is called the Lord High Steward; and there is a permanent officer of the royal household who bears the same designation. The universities of Oxford and Cambridge have each a high-steward, whose duty it is to assert and protect the privileges of the university courts.

High-treason. See TREASON.

Highway, in Law. See ROADS.

Highwaymen, robbers who attack passengers on the public road; those who rob on foot being further distinguished as footpads. Famous English highwaymen were Claude Duval (1643–70), Swift Nick Nevison (hanged at York in 1684), Dick Turpin (1705–39) and his comrade Tom King, and Jerry Abershaw (1773–95). Turpin's famous ride to York is a myth, based on a story told of Nevison, whose fame has even gained him a place in Macaulay's *History of England*. The best known romances of the road are W. H. Ainsworth's *Rookwood* and Lord Lytton's *Paul Clifford*. There are lists of books bearing on highwaymen in *Notes and Queries*, 5th series, vol. viii.; and biographical notices of most knights of the road ultimately came to appear in the pages of the *Newgate Calendar*.

High Wycombe. See WYCOMBE.

Hilarion, founder of the monastic system in Palestine, was born, according to the account of Jerome (which is adjudged by modern criticism to be no longer historical), at Tabatha, about 290, educated at Alexandria, and converted to the monastic system by St Anthony. He then lived as a hermit in the desert between Gaza and Egypt for many years, and finally died in Cyprus in 372. His memory is celebrated on 21st October.

Hilary, ST, Bishop of Poitiers, although by no means among the most voluminous of the Latin Fathers, yet, from the nature of the subjects on which he wrote, chiefly connected with the Arian controversy, occupies an important place in the patristic literature of the Western Church. He was born of pagan parents at Limonum (Poitiers) in the early part of the 4th century. His conversion to Christianity was mainly the result of his own study of the prophecies, and did not take place till he was advanced in life. About the year 350 he was elected bishop of his native city, and immediately rose to the first place in the animated contest of parties in the Arian controversy. Having

provoked the displeasure of the court party, he was imprisoned, and sent into exile in Phrygia: but he appears again in the Council of Seleucia in 359, and soon afterwards was permitted to resume possession of his see, where he died in 367. The church holds his day on the 13th January. His most important work is that on the Trinity, but his three addresses to the Emperor Constantius, by their vehemence, and by the boldness of their language, have most attracted the notice of critics. Hilary's theological writings are especially valuable for the history of the Arian party, and particularly for the doctrinal variations of that sect, and the successive phases through which it passed between the Council of Nice and the first Council of Constantinople. He is often styled 'Malleus Arianorum,' and the 'Athanasius of the West,' and was formally recognised as 'universæ ecclesiæ doctor' by Pius IX. in 1851. The most celebrated of the hymns attributed to him is the 'Beata nobis gaudia Anni reduxit orbita,' which was early inserted in western liturgies. The English Hilary term begins on the 11th and ends on 31st January.

See two German Lives by Reinkens (1864) and Baltzer (1881); also J. G. Cazenove's *Saint Hilary of Poitiers and Saint Martin of Tours* in the series of 'Fathers for English Readers' (1883). The best edition of the works of St Hilary is that of the Benedictine Dom. Coutant (Paris, 1693; new ed. 1844–45).

Hilary of Arles, St, was born about 403, educated at the celebrated monastic school of Lerins, and made bishop of his native city in 429. As metropolitan of Arles (*Arelate*) he presided at several synods, and especially at Orange in 441, the proceedings of which involved him in a serious controversy with the pope, Leo the Great. A deposed bishop, named Chelidonius, having carried an appeal to Rome, a council was summoned by Pope Leo, at which Hilary was present, and in which the condemnation of Chelidonius, as well as that of another bishop, Projectus, was reversed. Hilary, however, refused to submit to the decision, and soon afterwards quitted Rome—a proceeding which drew upon himself a very severe animadversion. He did not question the authority in itself, but he maintained that it was uncanonically exercised. In the end, however, he sought a reconciliation with Pope Leo, and the dispute was brought to an amicable termination. Hilary died at Arles in 449, and was canonised, his day being the 5th May.

Hilda, St, the patroness of Whitby, was daughter of Hereric, a nephew of Edwin of Northumbria, and was baptised at fourteen by Paulinus. Recalled by Bishop Aidan from her retreat in a French monastery, she became abbess of Heorta or Hartlepool in 649. In the year 657 she founded the famous monastery at Streoneshalh or Whitby, a double house for nuns and monks, over which she ruled with remarkable wisdom for twenty-two years, dying in 680. Scott's *Marmion* commemorates the belief that the fossil ammonites found here were snakes 'changed into a coil of stone' by Hilda's prayers. Her effigy still stands on the ancient seal of Hartlepool, and churches preserve her name both there and at South Shields.

Hildburghausen. See Saxe-Meiningen.

Hildebrand. See Gregory VII.

Hilden, a town of Rhenish Prussia, 8 miles SE. from Düsseldorf, has woollen, silk, velvet, and carpet manufactures, calico-printing, and machine-shops. Pop. 7946.

Hildesheim, a town in the Prussian province of Hanover, stands on a feeder of the Weser, 24 miles by rail SSE. of Hanover. It is to a large extent an antique town, with narrow streets, high-gabled houses (ornamented with bay-windows and carved woodwork), and many towers. The churches are the most notable buildings, and first amongst them stands the cathedral, dating from the 11th century. It is especially interesting for its antiquarian and artistic treasures, as the bronze gates (1015) with bas-reliefs, the church utensils, the so-called Irmin (q.v.) pillar, a rose-tree said to be a thousand years old, the brazen Christ pillar (1022), the carillon, &c. The St Godehard Church (1133–72) and St Michael's are splendid examples of Romanesque architecture. The so-called Templar House, the town-house (*circa* 1440), and certain antique private houses are interesting buildings. Pop. (1880) 25,887; (1890) 33,481. A bishop's see since 822, Hildesheim first came to Prussia in 1803, and finally in 1866. In 1868 a very valuable find of Roman silver ware was made near Hildesheim. See works by Lüntzel (1858), Wachsmuth (1863), Lachner (1882), and Cuno (1886).

Hilgenfeld, Adolf, theologian, was born 2d June 1823, at Stappenbeck near Salzwedel, studied at Halle and Berlin, and settled at Jena as professor of Theology (1850), representing the liberal school. Among his works are books on the Clementines, the Gospel of Mark, the Epistle to the Galatians, the Apostolic Fathers (1853), the Gospels (1854), *Das Urchristenthum* (1855), the Jewish Apocalyptic Writings (1857), Ezra and Daniel (1863), *Novum Testamentum extra Canonem receptum* (4 parts, 1866; 2d edition, 1876–84), *Messias Judæorum* (1869), *Hermas* (1873), an Introduction to the New Testament (1875), and the *Ketzergeschichte des Urchristenthums* (1884). Since 1858 he has edited the *Zeitschrift fur wissenschaftliche Theologie*.

Hill, Octavia, improver of working-men's houses, was the grand-daughter of Dr Southwood Smith, a well-known sanitary reformer, and was born about 1838. She laboured amongst the London poor under Frederick D. Maurice; and in 1864, supported by Mr Ruskin, she commenced her great work of improving the homes of working-men in the slums and dismal alleys of the metropolis. The plans she adopted were based upon the principle of teaching the people to help themselves, by inculcating in them proper notions of cleanliness, order, and self-respect. Her efforts have been crowned with singular success; the houses which have been improved yield a good percentage on the money spent in effecting the improvements; and hundreds of people have been helped to lead more comfortable and better lives. Miss Hill has written *Homes of the London Poor* (1875), *Our Common Land and other Essays* (1878), and papers in the magazines.

Hill, Rev. Rowland, a popular but eccentric preacher, was born 12th August 1744, at Hawkeston, the sixth son of a Shropshire baronet. Whilst a student of St John's College, Cambridge, he fell under the influence of Whitefield, the Methodist preacher, and at once began to tread in his footsteps. All his life through Hill retained his passion for open-air preaching: and the first ten years after his ordination were spent in itinerant preaching throughout England. But having built for himself Surrey Chapel in Blackfriars Road, London, in 1783, he regularly preached there to his life's end; and, although a Dissenter, he used the services, and regarded himself as a member of the Church of England, of which he had indeed been ordained a deacon. It is said that the 'first Sunday-school in the metropolis was established by Rowland Hill soon after the opening of Surrey Chapel.' He died on 11th April 1833. Rowland Hill was undoubtedly eloquent and possessed a rich fund of genuine humour, but at times his manner verged upon buffoonery. His *Village Dialogues* (1801; 34th

ed. 1839; latest ed. 1871) has been sold in large numbers. Besides this he wrote several pamphlets, as *Imposture Detected* (1777), *Aphoristic Observations* (1790), *Spiritual Characteristics* (1803; 3d ed. 1860), some volumes of *Sermons*, *Hymns*, and other works. See Lives by Sidney (1834), W. Jones (1834), Sherman (1857), Broome (1881), and Charlesworth (1876; 2d ed. 1886).

Hill, Rowland, Viscount Hill, was son of Sir John Hill of Hawkestone and nephew of the preceding, and was born at Prees Hall, in Shropshire, August 11, 1772. Entering the army at fifteen, he became captain at twenty, commanded the 90th regiment in Sir Ralph Abercromby's Egyptian expedition, and was gazetted brigadier-general in 1803. He accompanied Sir Arthur Wellesley to Spain in 1808, and was his right arm throughout the whole Peninsular war. His conduct and courage earned him a C.B. in 1811, and three years later he was made Baron Hill of Almarez for his capture of the forts of Almarez. At Waterloo he led the brigade which swept the Old Guard from the field, and he remained with the army of occupation as second in command until it evacuated the French territory. He succeeded Wellington as commander-in-chief of the army in 1828, but resigned in 1842, when he was made Viscount Hill. He died unmarried at Hardwicke Grange, Shropshire, December 10, 1842, and was succeeded in his titles and estates by his nephew Sir Rowland Hill, Bart. See his Life by the Rev. Edwin Sidney (1845).

Hill, Sir Rowland, K.C.B., originator of the uniform penny postage system and reformer of the post office, was born at Kidderminster on 3d December 1795. From a very early age down to 1833 he taught in his father's school—from 1819 in Hazlewood, near Birmingham, a school-house built by himself, and afterwards at Bruce Castle, Tottenham. Rowland was always of an inquiring and ambitious turn of mind, with a decided talent for initiating reforms. At first he busied himself with mechanical and other inventions, later in life with questions of public concern. In 1826 he was one of the founders of the Society for the Diffusion of Useful Knowledge. After he had ceased to teach, he took an interest in the socialistic schemes that were being discussed and experimented with about that time, especially by Robert Owen. Then his restless mind led him to take an active share in the colonisation of South Australia, under Wakefield's system of colonising. Amongst other things his attention had been drawn at different periods to postal questions; and he became sensible that there existed an urgent need for a diminution in the high rates of postage, which practically excluded all but the wealthy from postal intercourse. His views on the subject, advocating a low and uniform rate of postage, to be prepaid by stamps, between all places in the British Isles irrespective of distance, were published in the form of a pamphlet, *Post-office Reform*, in 1837. His plan was eagerly taken up by Mr Robert Wallace, M.P. for Greenock, who gave essential help in fighting the case through parliament. Two years later Hill was attached to the Treasury for the purpose of putting his projected reforms into execution; and on 10th January 1840 the present uniform penny rate came into force. On 6th May following stamped envelopes and adhesive stamps were issued to the public, but the preference for the latter was soon made manifest. In 1841 the Conservative government, which had consistently opposed the reduction of postage, came into office, and in the following year, through the influence of certain government officials who strongly resented all innovations, Rowland Hill was dismissed from his position. Four years later a sum of £13,000, raised by public subscription, was presented to him as a token of public esteem to a national benefactor. In the same year the Liberals returned to power, and Hill was appointed secretary to the Postmaster-general. This office was exchanged in 1854 for that of secretary to the post-office. In 1864 he was compelled to resign owing to ill-health, and was then awarded a pension of £2000 for life, together with a parliamentary grant of £20,000. The effect of his reforms in the United Kingdom has been to raise the number of inland letters from about 77 millions annually to about 1900 millions, or about twenty-five fold, and it may be stated generally that the main principles of his plan have now been adopted in every civilised country throughout the world. Sir Rowland Hill was made a Knight Commander of the Bath in 1860. He died at Hampstead on 27th August 1879, and was buried in Westminster Abbey. Amongst the other improvements and reforms he effected in the post-office system must be mentioned the establishment of the book-post (1848), the reform of the money-order office (1848), and of the packet service, and a multitude of minor improvements affecting the administration of the postal service. See the article Post-office; Sir Rowland Hill's book, *The State and Prospects of Penny Postage* (1844); and the Life (1880), by his nephew G. B. Hill, which includes Sir Rowland Hill's *History of the Penny Postage*.—His eldest brother, Matthew Davenport Hill (1792–1872), recorder of Birmingham from 1839 to 1866, distinguished himself by his labours for education and the reformation of criminals. See Memoir by his daughters (1878).

Hillah, or Hilla, a town of Turkey in Asia, on the river Euphrates, 60 miles S. of Bagdad, on the site of Babylon, out of the ruins of which it was built about 1100 A.D. Tanning and the manufacture of silk, cottons, and woollens are carried on. The population fluctuates between 7000 and 15,000.

Hillel, called Hababli ('the Babylonian') and Hazaken ('the Elder'), one of the greatest and most influential doctors of the Jewish law, was born about 60 B.C. in Babylonia, of poor parents, but in the female line of royal (Davidian) descent. When forty years old—so runs the Talmudic account—he migrated into Palestine for the purpose of studying the law under Shemaia and Abtalion, the great masters of the period. Five or six years after Herod had mounted the throne Hillel was elected president of the sanhedrim. The range of his acquirements is said to have been immense, embracing not only Scripture and tradition, but nearly all branches of human and superhuman knowledge. Yet he was one of the meekest, most modest, kind, and simple-hearted men. Hillel was the first who collected the numberless traditions of the oral law, and arranged them under six heads (see Mishna). Between him and his contemporary Shammai and their respective followers there arose a spirit of keen rivalry, the latter being advocates of greater strictness and rigour in the interpretation of the law. Hillel died about 10 A.D. His doctrine has often been compared with the early teaching of Jesus. See Delitzsch's *Jesus und Hillel* (3d ed. 1879).

Hiller, Ferdinand, pianist, musical composer, and writer on music, was born at Frankfort-on-Main on 24th October 1811. Having been a pupil of Hummel, he began to teach in his native town; but from 1829 to 1836 he laboured in Paris. The next nine years he spent partly in Italy, partly in Germany; it was during this period that he produced his best work, the oratorio *Die Zerstorung von Jerusalem* (1839). Then, after three years

service as municipal music-director in Düsseldorf (1847–50), he proceeded to Cologne, where he filled a similar post until his death, 10th May 1885. Amongst nearly 200 musical works which he published only a small number have retained their footing. But as a writer on musical subjects Hiller claims a higher place. His *Uebungen zum Studium der Harmonie und des Kontrapunktes* (12th ed. 1886) is extensively used; and there is much valuable criticism in *Aus dem Tonleben unserer Zeit* (1868–71), monographs on Beethoven (1871) and Mendelssohn (1874; 2d ed. 1878), *Musikalisches und Persönliches* (1876), *Briefe an eine Ungenannte* (1877), *Künstlerleben* (1880), and *Erinnerungsblätter* (1884).

Hillern, Wilhelmine. See Birch-Pfeiffer.

Hill-forts, the refuges and strongholds of the early inhabitants, exist in every country of Europe. Their range in time extends from the early prehistoric through the early historic periods of the racial areas in which they are found. They have no more definite form than that of a prevailing but irregular circularity. The site selected is usually enclosed and fortified with due regard to its specialties of situation and defensibility. Sometimes the fort instead of occupying the whole hill-top may occupy only the most defensible part of it. In other cases the whole eminence may be surrounded by defensive constructions completely encircling and protecting its upper portion. Occasionally these forts, though situated among the hills, are planted in the lower ground, commanding an extent of meadow-land or pasture. With regard to their construction, the hill-forts are usually either earthworks or stoneworks, rarely a mixture of both. In France the Gaulish forts of the pre-Roman period were often such extensive works as to be termed *oppida* by the invading Romans. Though built of dry-stone masonry, the parts of the walls most exposed to attack were bound together by great logs of wood, placed both longitudinally and transversely within the thickness of the rampart, so as to resist as much as possible the assaults of the battering-ram. The great dry-built stone rampart of the prehistoric fort at Burghead, in Elginshire, is similarly strengthened by logs of oak, but it is the only example of this method of construction yet known in Scotland, where hill-forts are perhaps more numerous than in any other European country. They are generally called 'duns' (see Dun) in the northern and 'camps' in the southern districts, where the older term survives in connection with a number of the principal forts, as Dumbarton (*Dun Bhreatan*), Dundonald in Ayrshire, and Dunpelder in Lothian, not to mention Dun Edin as the old name of Edinburgh. Among the most remarkable of the hill-forts of Scotland may be mentioned those of the two Caterthuns in Forfarshire—one a good example of the fort with earthen rampart, and the other with walls of dry stone—the Tap o' Noth, and the twin-summits of Benachie, each with its massive fortifications of stone, in Aberdeenshire, the remarkable stone fort of Dun Tuathal on Drummond Hill, overlooking the junction of the waters of the Lyon and the Tay, and one equally remarkable, called Dun-dalamh, in a similar situation in Laggan on the Spey, Inverness-shire.

Many of the dry-stone forts in Scotland present the peculiar feature of a partial vitrifaction of the materials of their walls. The same thing has been observed in connection with similar forts in Ireland, France, and Hungary. The attempt to account for the existence of this peculiarity has given rise to much speculation and controversy. But it seems to be clearly established that the so-called vitrified forts do not differ from the other dry-stone forts, if the vitrifaction be not regarded as a process of construction. No relevant and conclusive evidence on this point has been obtained from examination of the structures themselves; and against the arguments in support of the view that the vitrifaction was intended as a cementing process we have to put the facts (1) that no fort is wholly vitrified; (2) that where vitrifaction exists it occurs in patches, affecting sometimes a portion only of the thickness of the wall; and (3) that when it occurs on the exterior surface of the wall the upper parts are sometimes found partially vitrified, but with no trace of vitrifaction on the portions underneath. Among the best known of the so-called vitrified forts in Scotland are the Tap o' Noth in Aberdeenshire, Craig Phadric and Dunbhairdgall in Inverness-shire, Knockfarril in Ross-shire, Dun Mac Uisneachan in Argyllshire, and Finhaven in Forfarshire. In Wales stone forts are most numerous, while in England earthworks predominate. The earthen forts of Sussex explored by Colonel Lane Fox are sometimes of considerable magnitude, that of Cissbury, for instance, enclosing a space of 60 acres. They are, as a rule, of prehistoric origin. Some of the stone forts of Ireland, especially those of the Aran Isles, are of great magnitude and well preserved. Photographic views of them are given in Lord Dunraven's book on Early Irish Architecture.

Consult also Dr Christison's 'Prehistoric Forts of Peeblesshire,' and 'The Duns and Forts of Lorne' in the *Proceedings of the Society of Antiquaries of Scotland* (vols. xxi. and xxiii.); 'Mémoires sur les Ouvrages de Fortifications Gauloises,' &c. in the *Compte Rendu du Congrès Archæologique de France*, at Toulouse in 1874 (p. 427); 'Les Camps Barbares fortifiés en Hongrie,' by F. F. Romer, in the *Compte Rendu* of the Congress of Prehistoric Archæology held at Budapest in 1876 (vol. ii. p. 68); and 'Helvetische Denkmaler,' by Dr F. Keller, in *Mittheilungen der Antiquarischen Gesellschaft in Zurich* (vol. xvi.).

Hill Mustard. See Bunias.

Hilversum, a village in North Holland, 18 miles by rail SE. from Amsterdam, manufactures woollens and carpets. Pop. (1889) 12,199.

Himalaya (properly *Himálaya*; from two Sanskrit words meaning 'snow-abode') is, strictly speaking, the southern escarpment of the great Central-Asian plateau in so far as it falls between the Indus and the Brahmaputra. Thus limited, it extends from 73° to 95° E. long., over a distance of some 1500 miles. The Himalayas are not a single range, but a system of for the most part parallel ranges lying obliquely to the general direction of the system. They front the plain of the Ganges in northern India like a stupendous mountain wall, bending back in the west like a scimitar, the sharp edge turned next India. On the east the system is connected with the mountain-ranges of south-west China and northern Burma and Siam. On the north it is backed by the lofty plateau of Tibet, which ranges in elevation from 10,000 to 17,000 feet. At its north-western extremity it runs up into the Pamir plateau, from which radiate also the Hindu-Kush and the Kuen-Lun Mountains. The southern foot of the system rests upon the plain of the Ganges, which nowhere rises more than 1000 feet above the level of the sea. The edge of the outermost hills is skirted, for a distance varying in width from 10 to 15 miles, by a belt of swampy grass-land, traversed by numerous sluggish streams. These in many places overflow and form standing swamps, fringed with gigantic reeds. This belt, called the Tarai, does not extend west of the point where the Ganges breaks through from the mountains. These districts, owing to the great quantity of stagnant water and the great profusion of rank vegetation, are extremely unhealthy; many parts reek with

fevers of a very malignant type. Next above the Tarai lies a belt of forest of about the same width, called the Bhabar. Its soil consists of sand, liberally strewn with shingle beds and boulders. The waters of the minor streams that come down from the higher mountains are generally absorbed by this spongy talus-slope, and, passing through it underneath the surface, accumulate again on the upper edge of the lower-lying Tarai.

Above the Bhabar rise the foot hills of the Himalayan system, generally designated the Siwalik Hills, or sub Himalayan ranges. They vary in height from a few hundred feet up to 4000, and present steep faces to the plains; on the northern side the slope is gentler, being mostly met at short distances from the summit by the southern flanks of the inner ranges. Geologically the Siwalik Hills belong to the Tertiary formation, and to the Pliocene rather than to the Miocene period. From the ranges near the Jumna great quantities of fossils, mostly mammals and reptiles, all land and fresh-water animals, have been obtained. It is on the north side of the Siwalik foot-hills that the first mountains appear. They rise up abruptly to elevations ranging for the most part from 7000 to 10,000 feet, and cover a surface zone of 50 miles in breadth. This division embraces a large number of irregular ridges, characterised by great complexity of geological structure. They yield marine fossils. On these ranges stand the sanatoriums, such as Simla, Darjiling, Almora, &c., which are so essential to Europeans during the hot months. The space between the outer members of these ranges and the Siwalik foot-hills is occupied by narrow, shallow, longitudinal valleys, called Dun in the west and Mari in Nepal. They are partly covered with loose shingle and boulders, partly worn into terrace-like steps, partly broken by low, obliquely lying, watershed ridges, which throw off numerous small streams.

In the Himalayas proper two main axes can be determined with tolerable distinctness. One, the southern, contains the line of the great snowy peaks; the other, the northern, forms the watershed between the rivers of India and the rivers of Tibet. The mountains in the southern chain are amongst the loftiest in the world; a very great number of them exceed 20,000 feet (3¾ miles) in height. One of these, Mount Everest (29,002 feet), is the highest measured mountain in the world. Other lofty peaks in this division of the Himalayan system are Mount Godwin-Austen (28,265), the second highest in the range; Kinchinjinga (28,156); Dhawalagiri (26,286); Nanda Devi (25,700); Trisul (23,400), and several others more than 22,000 feet in altitude. The chain of great snowy peaks is, strictly speaking, a series of mountain-groups, each of which is connected with the watershed chain to the north by a transverse ridge, covered with snow and frequently bearing on its shoulders peaks that tower up to the height of 25,000 feet. Graham, who in 1883 ascended Kabru to a height of 23,700 feet, believed that there are other peaks which will be found to exceed Mount Everest in altitude, for the central parts of the system next Tibet have not yet been surveyed or even explored with anything approaching to thoroughness, mainly because of the jealousy and exclusiveness of the Tibetan authorities, within whose territory much of the loftiest region of the Himalayas falls. These transverse spurs from the northern chain, terminating in stupendous mountain knots, form deep valleys on either side in the space between the two chains. These deep valleys, fringed with overhanging glaciers, are the cradles of the great rivers of northern India. Here are the sources of the Ganges and the Indus and the Brahmaputra, and of hundreds of rivers and streams whose waters eventually reach the ocean through the mouths of these three great channels. The rivers of the Himalayas mostly make their way through the mountains at the bottom of wild and narrow gorges, often several thousands of feet deep, the path through the various chains being mostly at right angles to the strike of the ridge. The inclination of the rivers is, however, nowhere very steep, except along one line: about ten miles south of the chain of great peaks the rivers descend about 5000 feet in the course of a few miles.

This indicates that the whole region must at one time have been bodily upheaved, and before the period of upheaval there existed here a natural ridge or fold of the earth. Geologists indeed believe that the entire site of the Himalayan system, taken in its widest extent, in which it embraces the whole of the Tibetan plateau as far as the outer Kuen-Lun Mountains, was in distant geologic ages the bed of a vast sea or ocean. The mountains are believed to be the result of the action of mechanical forces, such as horizontal compression and tension, combined with lateral stress and strain, operating upon the cooling crust of the earth in a region where, owing to the recent evaporation of the ocean, it was softest and most pliable, and therefore offered least resistance. The rocks of this part of the system are principally crystalline gneiss and mica schist, with veins and zones of granite intruding. The snowy region of the Himalayas is plentifully studded with glaciers, some of them of great extent: one has been surveyed in the western part of the system 36 miles in length. In the same region they descend to 11,000 and 12,000 feet, in the eastern part of the system not lower than 13,000 and 14,000 feet; and on the Tibetan side they are seldom found to come lower than 15,000 and 16,000 feet. This difference is partly due to the difference between the angles of declivity on the north and on the south sides of the chief ranges, partly also to differences in climatic conditions, the principal being the heavier snowfall and the greater rainfall which take place on the south, and the greater dryness of the atmosphere on the Tibetan plateau. Conformably with these facts, the snow-line ranges higher on the Tibetan side than on the Indian: whereas, on the watershed chain, it seldom descends lower than 18,000 feet, and on the tableland remains at 20,000, on the southern faces of the mountains it runs at 15,000 or 16,000 feet. The watershed chain has been little explored; it lies chiefly within Tibetan territory. The only exception to the former statement occurs on the west, where the Mustagh range, which is crossed by the pass of Karakoram (18,350), towers above the mountain valley of Kashmir, forming its northern wall, as the Pir-panjal, a range of the outer Himalaya division rising to 14,000 or 15,000 feet, shuts it in on the south. This watershed chain forms an almost continuous line of peaks, its crest being probably over 18,000 feet in elevation. So far as is known, it is only broken by one pass of less altitude than 16,000 feet, namely the Dras pass leading from Kashmir, which is 11,300 feet above sea-level. The Niti Pass (16,676), south-east of Ladak, connects the best roads from India and from East Turkestan.

The Himalayas possess few lakes. In the east, north of Sikkim, are Yamdok-cho or Palti, 45 miles in circumference, with an island, 2000 to 3000 feet high, in the centre; and Chomto-dong, 20 miles long by 16 broad, at an altitude of 14,700 feet. More to the west lie the holy Tibetan lakes of Manasarowar and Rakas Tal, which give birth to the river Sutlej. Besides these there are Nainital in Kumaon and the Lake of Kashmir. In nearly all parts of the Himalayas metallic ores

have been ascertained to exist. But gold, iron, copper, and lead are the only minerals extracted. Gold is largely mined in Tibet; copper and iron ore are worked in Kumaon and Garwhal.

In the lower, hotter, and moister parts of the Himalayas, chiefly towards the east, the flora is closely related to that of the Malay Peninsula and islands. Farther west, as the drier, colder parts are approached, it approximates to the European flora. On the lower ranges the chief vegetative forms are sals, sissus, bamboos, palms, acacias, rhododendrons, ferns, orchids, &c. in the east, and oaks, pines, spruces, firs, cedars, deodars, and others in the west. On the highest ranges the principal trees are conifers and poplars, with a great variety of alpine plants. The European beech does not grow on the Himalayas. Cultivation does not ascend higher than 7000 feet, except in a few of the warmer valleys. The plants of greatest commercial importance cultivated on the Himalayan slopes are tea and cinchona. In respect of its fauna this region is one of the richest in the world, particularly in birds. Among the more remarkable animals may be mentioned bears, wild cats, leopards, tigers, sun-bears, cat-bears, yaks, musk-deer, wild goats, wild sheep, wild dogs, flying squirrels, the bamboo-rat, and water-shrews. Insects are almost as numerous as birds.

Within Indian territory most of the inhabitants of these mountains are Hindus. The Tibetan portions are occupied by peoples of Turanian stock. No statement can be given of the total number of these mountaineers; many of them live in remote valleys, and are almost unknown, whilst many others dwell outside the limits of the British dominions. In Hindu mythology these majestic mountains are invested with great sanctity. Thousands of pilgrims travel year after year to the holy sources of the Ganges. The temples they visit stand beside the glaciers from which the river emerges, at Gangotri, Kedarnath, and Badrinath. Other temples, scarcely less sacred, stand beside the source of the Jumna at Jamnotri.

Wilson, *Abode of Snow* (1875); Strachey, *The Himalaya* (1890); and Sir W. M. Conway, *Climbing in the Karakoram Himalayas* (1894).

Him'era, an ancient city on the north coast of Sicily, east of Panormus (*Palermo*), and near the mouth of the river Himera, was a Greek colony established 649 A.D., and destroyed in 409 by the Carthaginians, who afterwards built Thermæ (mod. *Termini*) across the river. Stesichorus was a native of Himera, Agathocles of Thermæ.

Himilco. See CARTHAGE.

Himyaritic, a name formerly in use for the language of the ancient Sabæan inscriptions in the south-west of Arabia. See ARABIAN LANGUAGE, SABEANS, SEMITIC LANGUAGES.

Hinckley, an ancient town of Leicestershire, and partly also of Warwickshire, 13 miles SSW. of Leicester. Its parish church, with a beautiful oak roof, is supposed to have been erected during the reign of Edward III. Hinckley has manufactures of cotton hosiery and of boots and shoes. It stands on the old Watling Street. Pop. (1851) 6111; (1891) 9638.

Hincmar, a celebrated churchman of the 9th century, of the family of the Counts of Toulouse, was born in 806. He was educated in the monastery of St Denis; was named abbot of the abbeys of Compiègne and St Germain; and in 845 was elected Archbishop of Rheims. Rothadius, Bishop of Soissons, and suffragan of Hincmar, deposed a priest of his diocese, who appealed to Hincmar, as metropolitan, and was ordered by him to be restored to office. Rothadius, resisting this order, and having been in consequence excommunicated by the archbishop, appealed to the pope, Nicholas I., in 862, who at once ordered Hincmar to restore Rothadius, or to appear at Rome to vindicate the sentence. Ultimately Nicholas annulled the sentence. Hincmar, after some demur, was forced to acquiesce, and Rothadius was restored to his see. Hincmar wrote much against the strong predestinarian views of the monk Gottschalk, whom he united with others in degrading and imprisoning. Gottschalk died in prison after eighteen years' confinement.

The conduct of Hincmar is also historically interesting in relation to the temporal power of the medieval papacy. Under Adrian II. a question arose as to the succession to the sovereignty of Lorraine on the death of King Lothaire, the pope favouring the pretensions of the Emperor Lewis in opposition to those of Charles the Bold of France. To the mandate which Adrian addressed to the subjects of Charles and to the nobles of Lorraine, accompanied by a menace of the censures of the church, Hincmar offered a firm and persistent opposition. He was equally firm in resisting the undue extension of the royal prerogative in ecclesiastical affairs. When the Emperor Lewis III. sought to obtrude an unworthy favourite upon the see of Beauvais, Hincmar boldly remonstrated, and fearlessly denounced the unjustifiable usurpation. Hincmar died in the year 882.

His works were collected by the Jesuit Sirmond (1645), and are to be found in Migne's *Cursus Patr. Compl.* His *Annales Bertiniani*, from 861 to 882, are in vol. i. of Pertz's *Monumenta*. See Prichard, *Life and Times of Hincmar* (1849), and German works by Noorden (1862), Sdralek (1881), and Schrörs (1884).

Hind, the female of the Stag (q.v.) or Red Deer. The term is also sometimes applied to the female of some other deer—though never to any other British or European species—and is sometimes even extended to female antelopes.

Hind, JOHN RUSSELL, astronomer, was born at Nottingham, May 12, 1823. At an early period he became an enthusiast in the study of astronomy, and in 1840 obtained, through the influence of Professor Wheatstone, a situation in the Royal Observatory at Greenwich, where he remained till June 1844. Hind was then sent as one of the commission appointed to determine the exact longitude of Valentia, and on his return became the observer in Mr Bishop's Observatory, Regent's Park, London. Here he calculated the orbits and declination of more than seventy planets and comets, noted a number of new movable stars, and between 1847 and 1854 discovered ten minor planets (see PLANETOIDS). In 1851 Hind obtained from the Academy of Sciences at Paris their Lalande medal, and was elected a corresponding member; in 1852 he obtained the Astronomical Society of London's gold medal, and a pension of £200 a year from the British government; in 1853 he undertook the editing of the *Nautical Almanac*. Hind's scientific papers were generally published in the *Transactions of the Astronomical Society*, in the *Comptes Rendus* of Paris, and the *Astronomische Nachrichten* of Altona. Amongst his works are *Astronomical Vocabulary* (1852), *The Comets* (1852), *The Solar System* (1852), *Illustrated London Astronomy* (1853), *Elements of Algebra* (1855), and *Descriptive Treatise*

on Comets (1857). For a time president of the Royal Astronomical Society, he died 23d December 1895.

Hindi. Hindustani, Hinduism. See India.

Hindley, a town of Lancashire, 3 miles SE. of Wigan by rail. There are numerous coal works in the vicinity; and the cotton manufacture is largely carried on. Pop. (1851) 5285; (1891) 18,973.

Hindu Kush (the 'Indian Caucasus' of Alexander the Great's historians) forms the westward continuation of the Himalayan system, of which it is sometimes reckoned a part, and from which it is separated by the chasm through which the Indus breaks its way to the plains. It strikes off from the south-west angle of the Pamir plateau, and extends westwards for 365 miles to the Bamian valley in Afghanistan, separating that country on the south from Turkestan on the north. Near its point of origin several rivers take their birth; the Oxus goes off north west through Turkestan, and the Helmund south-west through Afghanistan. The main range breaks into four subsidiary ridges, and has a total width of about 200 miles. Unlike the Himalayas, it sinks suddenly to the plains of Turkestan on the north. It is crossed by several passes, at an average elevation of 12,000 or 13,000 feet. From the Bamian valley the range is continued westwards as a low watershed elevation, known as Koh i Baba. (Koh i Baba is also the name of a peak in the Hindu Kush.) The peak of Hindu Koh, about 80 miles to the north of the city of Kabul, is estimated to be more than 20,000 feet above the sea. The highest point in the range that has been yet measured exceeds 23,000 feet. The flanks of the mountains are mostly barren and destitute of cultivation; but minerals, especially iron, occur in great abundance. The inhabitants consist principally of Dards (see Dardistan) and Shins, the latter the descendants of the original colonists of the country. A loose kind of Mohammedanism is the prevalent form of religion. See J. Biddulph, *Tribes of Hindu Kush* (Calcutta, 1880). Conway ascended Pioneer Peak, 23,000 feet, and saw others higher than Everest. See Himalayas.

Hindustan. See India.

Hinnom, Valley of. See Gehenna.

Hinny, the hybrid produced between a horse and a female ass. It is smaller than a mule, but the body is more bulky in proportion to the legs, and its strength is inferior. It is less valuable than the mule, although it is more docile. The hinny is rare. It was described by some of the earlier naturalists as a hybrid between the ox and the ass.

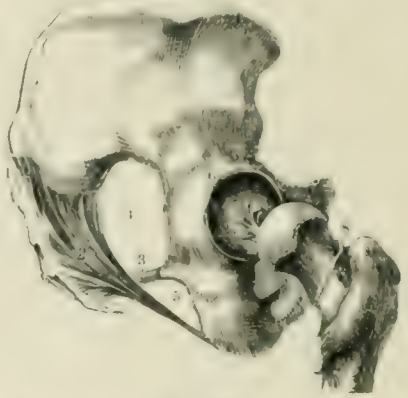
Hinojosa-del-Duque, a town of Spain, 45 miles NNW. of Cordova, with some linen and woollen manufactures. Pop. 9500.

Hinton, James, aurist and metaphysician, was born in 1822, son of a Baptist minister, studied medicine at St Bartholomew's Hospital, and, after much travel, settled about 1850 to a London practice, ultimately becoming a specialist in aural surgery. From 1862 till 1874 he was a lecturer on this department at Guy's Hospital. He died 16th December 1875. In his lifetime he published *Man and his Dwelling place* (1859), *Life in Nature* (1862), and the *Mystery of Pain* (1865); and after his death appeared, with other works, *Philosophy and Religion* (1881) and *The Law-breaker and Coming of the Law* (1884). These books contain striking and suggestive things enough, but their author evidently took himself too seriously as a metaphysician, as has also been done by a handful of disciples. See his *Life and Letters*, by Ellice Hopkins (1878).

Hiogo. See Hyogo.

Hip. See Rose.

Hip-joint is a ball and socket joint formed by the reception of the globular head of the thigh bone (or femur) into the deep pit or cup in the *os innominatum*, which is known as the *acetabulum*. If the variety of the movements of this joint—viz. flexion, extension, abduction, adduction, and rotation inwards and outwards, and at the same time its great strength are considered, it may well claim to be regarded as the most perfect joint in the whole body. The reader will form a tolerably clear conception of the relative forms of the acetabulum and the head of the thigh-bone from a glance at the figure, in which the surrounding parts are cut away, and



Hip-joint:

1, 2, 3, pelvic ligaments; 4, 5, the greater and lesser sacro-ischiatic foramina; 6, the cotyloid ligament; 7, the round ligament; 8, the cut edge of the lower part of the capsular ligament.

the thigh-bone is drawn out of its socket. The ligaments are usually described as five in number—the capsular (consisting of circular and longitudinal fibres, of which the most important are the *ilio-femoral* or Y-shaped band), *teres* or round, cotyloid, and transverse ligaments. Of these the capsular ligament, supposed to be removed in the figure, is the most important, and extends from the edge of the cup to the circumference of the neck upon which the ball is carried, enclosing the bony parts in a strong sheath. The great use of the capsular ligament is to limit the extension of the hip-joint, and thus to give steadiness to the erect posture. The *teres* or round ligament is in reality triangular rather than round, and has its apex attached to the head of the thigh-bone. The joint is much strengthened by a large number of surrounding muscles, some of which are of considerable power. The experiments of Weber show that atmospheric pressure is the real power by which the head of the femur is retained in the acetabulum when the muscles are at rest.

Disease of the Hip Joint. Hip disease differs in many points of importance from other joint-diseases. Its connection with scrofula is more distinctly marked than that of most other joint-diseases, and it almost always occurs before the age of puberty. It comes on, in children or young persons of a scrofulous constitution, from very slight causes; thus, it is often traced to over-exertion in a long walk, a sprain in jumping, or a fall; and in many cases no apparent cause can be assigned. In the early stage of the disease the whole of the structures of the joint are inflamed, and by proper treatment at this period the morbid action may be sometimes subdued without any worse consequences than a more or less rigid joint. Usually, however, abscesses form around the joint, and often communicate with its interior; and the

acetabulum and the head and neck of the thigh-bone become disintegrated, softened, and gritty. In a still more advanced stage dislocation of the head of the thigh-bone commonly occurs, either from the capsular ligament becoming more or less destroyed, and the head of the bone being drawn out of its cavity by the action of the surrounding muscles, or from a fungous mass sprouting up from the bottom of the cavity, and pushing the head of the bone before it. It is of extreme importance that the symptoms should be detected in an early stage of the disease.

As the disease advances abscesses occur around the joint. True shortening of the limb now takes place, which at the same time becomes adducted and inverted. From this stage, if the health is pretty good, and the lungs are sound, the patient may be so fortunate as to recover with an anchylosed (or immovable) hip-joint; but the probability is that exhaustion and hectic will come on, and that death will supervene, from the wasting influence of the purulent discharges occasioned by the diseased bone. The duration of the disease may vary from two or three months to ten or more years.

As the treatment must be left entirely in the hands of the surgeon it is unnecessary to say more than that the most important points are *perfect rest* to the affected part, which may be effected in various ways, the internal administration of cod-liver oil and tonics, and the application of counter-irritation by means of an issue behind the great trochanter.

Hipparchus, the first systematic astronomer on record, was born at Nicæa, in Bithynia, and flourished between 160 and 125 B.C. Of his personal history nothing is known except that he observed at Rhodes. The only authority we have regarding his researches is the *Syntaxis* of Ptolemy; from it we learn that Hipparchus discovered the precession of the equinoxes and the eccentricity of the sun's path, determined the length of the solar year and the distances of the sun and moon respectively from the earth, invented the planisphere, drew up a catalogue of 1080 stars, and fixed the geographical position of places on the earth by giving their longitude and latitude. All that we have of his works is a commentary to the poetical description of the stars by Aratus, published in Patavius's *Uranologia* (1630). See Delambre's *Histoire de l'Astronomie Ancienne* (Paris, 1817).

Hipparion, a fossil genus of Equidæ. See HORSE.

Hippias and **Hipparchus.** See PISISTRATUS.

Hippocampus antiquorum.

Hippo. See BONA.

Hippocampus (Gr.; a sea-monster on which the gods rode), commonly called SEA-HORSE, a genus of curiously modified marine fishes, which, with the Pipe-fish (q.v.), compose the family Syngnathidæ, belonging to the order Lophobranchii, whose gills are disposed in tufts. They derive their generic name from the remarkable likeness which the head and neck bear to those of a horse, or perhaps even more strikingly to those of the knight in a set of chessmen. They are all characterised by the prehensile tail devoid of a fin, by which they cling to the stems of sea-weeds or corals, or even to each other; the body is compressed and more or less elevated; the shields have more or less prominent tubercles or spines; the hinder part of the head forms a flattened crest, terminating above in a prominent knob (coronet); pectoral fins and a dorsal fin are present. The males have a pouch beneath the tail, in which they carry the eggs until they are hatched. As in all other fishes of the order, there is a long snout, and at its extremity a small toothless mouth. The fins vibrate with great rapidity, and present the appearance of a rotating wheel or a delicate waving web, but the animals move only slowly and for a short distance at a time, usually in a half upright posture. There are about twenty species, mostly inhabiting tropical seas; some have a wide area of distribution, as they are not unfrequently carried to great distances by floating materials to which they have attached themselves. *H. antiquorum* of Australia, the Atlantic, and Mediterranean, is occasionally found

Phyllopteryx eques.

on British shores. The allied genus Phyllopteryx, of which three species are known from Australia, is remarkable for its long streaming filaments, which very closely mimic the fronds of the Fucus among which it lives.

Hippocampus. See BRAIN.

Hippocras (*vinum Hippocraticum*, 'wine of Hippocrates'), an aromatic medicated wine, formerly much used as a cordial. It was prepared from white wine, flavoured with cinnamon and other spices, lemon peel, almonds, &c., and sweetened with honey or sugar.

Hippocrates, the most celebrated physician of antiquity, was the son of Heracleides, who was also a physician, and belonged to the family of the Asclepiadæ, Hippocrates himself being either nineteenth or seventeenth in descent from Æsculapius. His mother, whose name was Phænarete, was said to be descended from Hercules. He was born in the island of Cos, probably about 460 B.C. He is said to have been instructed in medicine by his father and by Herodicus, and in philosophy by Gorgias of Leontini, the celebrated sophist, and Democritus of Abdera, whose cure, when he was mentally deranged, he afterwards effected. After visiting some parts of Greece, particularly Athens, then at its intellectual zenith, he settled in practice at Cos. He died at Larissa, in Thessaly, but at what age is uncertain, different ancient authors stating it to have been at 85, 90, 104, and 109 years. Clinton (*Fasti Hell.*) places his death 357 B.C., at the age of 104. We know little more of his personal history than that he was greatly esteemed as a physician and an author, and that he raised the medical school of Cos to a very high reputation.

His works were quoted by Plato, who compared him to Polycletus and Phidias, and by Aristotle, who called him 'the great.' Various stories are recorded of him by Greek writers, to which, being undoubtedly fabulous, it is unnecessary to advert; and we find legends regarding him in the works of Arabic writers, who term him 'Bokrat,' while the European story tellers of the middle ages celebrate him under the name of 'Ypocras,' and, in defiance of chronology, make him professor of medicine at Rome, with a nephew of wondrous medical skill, whom he despatched in his own stead to the king of Hungary.

The works bearing the name of Hippocrates, and termed the Hippocratic Collection, are more than sixty in number, and were divided by Dr Greenhill into eight classes. The first class comprises works *certainly* written by Hippocrates, including *Prognostica*; *Aphorismi*; *De Morbus Popularibus*; *De Ratione Victus in Morbis Acutis*; *De Aere, Aquis, et Locis*; and *De Capitis Vulneribus*. Some eminent critics doubt the genuineness of some portions of the *Aphorismi*, the work by which Hippocrates is most popularly known. The second class is composed of works *perhaps* written by Hippocrates. They are eleven in number, and one of them is the well-known *Jusjurandum*, or 'Hippocratic Oath.' The others consist of works written before Hippocrates, works whose author is conjectured, works by quite unknown authors, wilful forgeries, &c.

For anything like a full account of his views we must refer to the various writers who have treated of the history of medicine. We can here only mention that he divides the causes of disease into two principal classes: the first consisting of the influence of seasons, climates, water, situation, &c.; and the second of more personal causes, such as the food and exercise of the individual patient. To the influence which different climates exert on the human constitution he confidently ascribes both the conformation of the body and the disposition of the mind, and hence accounts for the differences between the Greek and the less hardy Asiatic. The four fluids or humours of the body (blood, phlegm, yellow bile, and black bile) were regarded by him as the primary seats of disease; health was the result of the due combination (or *crasis*) of these, the disturbance of which produced illness. When a disease was proceeding favourably these humours underwent a certain change (or *coction*), which was the sign of returning health, as preparing for the expulsion of morbid matter, or *crisis*, these crises having a tendency to occur at definite periods, which were thence called 'critical days.' His treatment of diseases was cautious, and what we now term expectant; it consisted chiefly and often solely in attention to diet and regimen; and he was sometimes reproached with letting his patients die by doing nothing to keep them alive.

The works of Hippocrates were translated at an early period into Arabic. They were first printed in a Latin translation in 1525 at Rome. The first Greek edition (the Aldine) appeared the following year at Venice; an edition by Mercuriali appeared in 1588, one by Foes in 1595, and one by Van der Linden in 1665. Others have appeared under the editorship of Chartier, Kühn, &c. The best edition, with an admirable French translation, is that of Littré (10 vols. 1839–61). A scholarly edition by Ermerius, with a Latin rendering, was published in 1859–65 at Utrecht, at the expense of the university of Amsterdam. An excellent English translation of the *Genuine Works of Hippocrates* was published in 1849, in 2 vols., by Dr Adams of Banchory, Aberdeenshire.

Hippocrene (derived from *hippos*, 'a horse,' and *krēnē*, 'a fountain'), a fountain on the northern slope of Mount Helicon, in Greece, sacred to the Muses and Apollo, which, according to the mythical account, was produced by a stroke from the hoof of the horse Pegasus (q.v.). It is identified with a spring at the modern Makariotissa.

Hippodamia, the beautiful daughter of Œnomaus, king of Pisa, in Elis. It had been predicted to her father that he should be slain by his future son-in-law; he therefore stipulated that every suitor of his daughter should run a chariot-race with him, and that death should be the consequence of defeat. At length Pelops bribed the king's charioteer, and thus succeeded in reaching the goal before Œnomaus, who, in despair, killed himself. Hippodamia became by Pelops the mother of Atreus and Thyestes.

Hippodrome (Gr. *hippos*, 'a horse,' and *dromos*, 'a racecourse'), the Greek name for the place set apart for horse and chariot races. Its dimensions were, according to the common opinion, half a mile in length, and one-eighth of a mile in breadth. In construction and all the most important points of arrangement it was the counterpart of the Roman Circus (q.v.). See also OLYMPIC GAMES, CONSTANTINOPLE.

Hippogriff, or HIPPOGRYPH (Gr. *hippos*, 'a horse,' and the word *gryph*, 'griffin'), a fabulous animal, unknown to the ancients, which is represented by modern writers as a winged horse with the head of a griffin. The hippogriff figures as the horse of the Muses, and plays a conspicuous rôle in the *Orlando Furioso* of Ariosto.

Hippolytus, a Christian writer who enjoyed great celebrity in the first half of the 3d century, but of whose personal history we know but little with certainty. He was born most likely about 155–160 A.D., and died about 235 or 236. The first to mention him is Eusebius, who says he was a bishop somewhere, and some writers have placed his diocese in Arabia, while almost all the eastern writers style him Bishop of Rome. He is usually described by modern writers as Bishop of Portus, near Rome, but for this title there is no evidence earlier than the middle of the 7th century. He may have been a native of the East, and he is said to have been a disciple of Irenæus; but this may have been either in Asia Minor, in Gaul, or in Rome itself, which Eusebius tells us that Irenæus visited about 178. An entry in the Liberian Catalogue of bishops of Rome tells that Pontianus the bishop and Hippolytus the presbyter were transported as exiles to the mines of Sardinia, where ere long they perished, their bodies being carried back to Rome. Prudentius (5th century) gives a different but much less credible account of the martyrdom of Hippolytus, according to which he was torn in pieces by wild horses like the Hippolytus of mythology. He tells us that he was infected with the Novatian heresy, but recanted on the way to martyrdom. Such was the unsatisfactory state of knowledge when the recovery at Mount Athos by Minoides Mynas in 1842 of the treatise against heresies cast fresh light upon Hippolytus as its presumptive author. It was contained in a 14th-century MS., and when published by Miller in 1851 was recognised as forming part of the fragment ascribed to Origen and entitled the *Philosophumena*. Its appearance opened up a grave discussion. The Origenistic authorship was soon abandoned, and attempts were made by Baur to ascribe it to Gaius, by De Rossi to Tertullian, by Armellini to Novatian. Jacobi advanced the claims of Hippolytus, and this theory was supported by Bunsen and Wordsworth, and so conclusively proved by Döllinger as to persuade almost every scholar save Lipsius, who still continued to describe the author as Pseudo Origenes.

From the treatise itself we learn that the autho

lived at Rome, and took an active part in church affairs under the bishops Zephyrinus and Callistus. Döllinger points out that throughout Hippolytus never recognises Callistus as bishop, and treats him only as the founder of a school. Besides he assails his moral character and his antecedents, charging him with dishonesty, with criminal laxity of discipline, and with the Patripassian heresy; while Callistus again retorted upon his opponent with a counter-charge of Ditheism. Döllinger held that Hippolytus claimed to be the real Bishop of Rome himself, and that he was thus the first antipope in the history of the Roman Church. This would explain the circumstance that a writer so learned and outstanding as Hippolytus could be taken by the Eastern Church for the actual Bishop of Rome, while to western writers who did not receive him as such he seemed guilty not only of schism but of heresy. But the grave difficulty remains of being obliged to believe that a schism so serious, headed by the most illustrious theologian of the time, and lasting at the very lowest five or six years, could have occurred without its being known outside of Rome, and still further could be utterly forgotten for fifteen centuries. Again, if Hippolytus had headed a party so inimical to the authority of the bishop, how comes it that his name has descended without a stain as that of a saint and a martyr? Dr Salmon suggests the explanation that Hippolytus may have been the head of the Greek Christians at Rome, and that as such he may have been specially entrusted with some episcopal functions—an anomalous state of matters which would come to an end with the necessity for it. His attacks on Callistus were written in Greek for Greek-speaking people, hence the faintness of the impression they made upon the Latin world; while at the same time most of the recollections of the earlier part of the century were lost in the severity of persecution under Decius and Valerian. At anyrate the state of the controversy shows that in the 3d century Christians elsewhere than at Rome itself were not much interested in the question who was Bishop of Rome at all. Hippolytus seems to have championed the severe and ultra-orthodox party in the Roman Church, and at the least to have been bitter and prejudiced as a controversialist. The ecclesiastical charges brought against Callistus in this famous treatise are his giving easy absolution to sinners excommunicated by Hippolytus and others, admitting digamists and trigamists to the ranks of the clergy, allowing the clergy to marry, and permitting Christian ladies to contract illegal marriages with men of inferior social rank.

The date of Hippolytus and his importance among his contemporaries are proved further by the statue of him discovered at Rome, on which is engraved the sixteen years' cycle which he invented to find the time of Easter. This cycle is an erroneous one, the error being of such a nature as could not fail to be discovered after a dozen years, hence it follows that the statue in his honour must have been inscribed before that discovery occurred, about 240 A.D.

The extant writings of Hippolytus were first collected by Fabricius (2 vols. Hamburg, 1716-18), and have since been printed in vol. II. of Galland, *Bibl. Vet. Pat.*, and vol. X. of Migne's *Patr. Gr.* The most accessible edition is that of Lagarde (1858). English translations of the *Refutation*, as well as the other extant works and fragments, may be found in Clark's 'Ante-Nicene Christian Library.' Bishop Lightfoot thought it more than probable Hippolytus was the author of the famous Muratorian Canon, as there was no other man at that time at Rome capable of writing it.

See Bunsen, *Hippolytus and his Age* (1852; 2d ed. 1854); Christopher Wordsworth, *St Hippolytus and the Church of Rome* (1853; 2d ed. 1880); Döllinger, *Hippolytus and Kallistus* (1853; Eng. trans. by Plummer, 1876); Volkmar, *Hippolytus u. die Römische Zeitgenossen* (1855); Lipsius, *Zur Quellen kritik des Epiphanios* (1865), also *Die Quellen der ältesten Ketzergeschichte* (1875); and Harnack, *Zur Quellen-kritik der Geschichte des Gnostizismus* (1873-74).

Hippophagy. Hippophagi (Gr., 'eaters of horse-flesh') was a name given by the Greeks to a Scythian people, living north-east of the Caspian Sea, and to a Sarmatian tribe north of the Euxine. In some parts of modern Europe horse-flesh is a regular and wholesome article of diet. In France a society of hippophagists was formed under the auspices of Geoffroy St Hilaire; in 1866 the sale of horse-flesh in the Paris markets as an article of food was officially recognised and regulated: and during the siege of Paris horse-flesh was gladly eaten by all who could get it. In 1872 about 5000, in 1895 over 30,000, horses were eaten in Paris alone. In Britain an act was passed in 1889 regulating the sale of horse-flesh, requiring that all horse-flesh (or flesh of asses and mules) exposed for sale shall be expressly so described in legible and conspicuous characters, and imposing a penalty of £20 on any one breaking this rule, or giving any one horse-flesh who has asked for meat other than horse-flesh.

Hippopotamus (Gr., 'river-horse'), a genus of artiodactyle ungulate mammals, constituting a family by itself. Till of late only one species was known as now existing, although the fossil remains of others indicate the greater abundance and wider distribution of the form in other periods of the earth's history. The largest and best-known species, *H. amphibius*, is—or, within historic periods, has been—found in almost all parts of Africa, to which

Hippopotamus amphibius.

quarter of the globe it is entirely confined. A smaller species, *H. liberiensis* (distinguished by some as a distinct genus, Cæropsis), was described in 1844 as an inhabitant of the rivers of western Africa within the tropics, and differs from the common species, and from all the fossil species, in having only two incisors, instead of four, in the lower jaw. But as the missing teeth occasionally exist there seems no valid reason for separating this form generically. The common hippopotamus is one of the largest of existing quadrupeds, the bulk of its body being little inferior to that of the elephant, although its legs are so short that its belly almost touches the ground, and its height is not much above five feet. It is extremely aquatic in its habits, living mostly in lakes or rivers, often in tidal estuaries (where the saltness of the water compels it to resort to springs for the purpose of drinking), and sometimes even in the sea, although it never proceeds to any considerable distance from the shore. Its skin is very thick—on the back and sides more than two inches; it is dark brown

(albino and piebald individuals have been seen), destitute of hair, and exudes a reddish fluid, which has been said to have given rise to the legends of sweating blood. The tail is short. The feet have each four toes, nearly equal in size, and hoofed. The neck is short and thick. The head is very large, with small ears, and small eyes placed high, so that they are easily raised above water, without much of the animal being exposed to view. The muzzle is very large, rounded, and tumid, with large nostrils and great lips concealing the large front teeth. The hippopotamus cuts grass or corn as if it were done with a scythe, or bites with its strong teeth a stem of considerable thickness neatly through. The skull, while it is distinguished by remarkable peculiarities, corresponds in the most important characters with that of the hog. The respiration of the hippopotamus is slow, and thus it is enabled to spend much of its time under water, only coming to the surface at intervals to breathe. It swims and dives with great ease, and often walks along the bottom, completely under water. Its food consists chiefly of the plants which grow in shallow waters and about the margins of lakes and rivers; and it probably renders no unimportant service in preventing slow streams from being choked up by the luxuriance of tropical vegetation, the effect of which would, of course, be an increase of the extent of swampy land. It often, however, leaves the water, chiefly by night, to feed on the banks, and makes inroads on cultivated fields, devouring and trampling the crops. It is a gregarious animal; and the havoc wrought by a herd of twenty or thirty is very great, so that wherever cultivation extends war is waged against the hippopotamus, and it disappears from regions where it formerly abounded. Thus it is no longer found in Lower Egypt, although still abundant farther up the Nile. It is taken in pits, which are digged in its usual tracks; it is killed by poisoned spears, is pursued by means of canoes, is harpooned, and is shot. The flesh is highly esteemed; the fat, of which there is a thick layer immediately under the skin, is a favourite African delicacy, and when salted is known at the Cape of Good Hope as *Zee-koe speck* ('Lake-cow bacon'). The tongue and the jelly made from the feet are also much prized. The hide is used for a variety of purposes; and the great canine teeth, which sometimes weigh 8 or even 12 lb., are particularly valuable as ivory, and are a very considerable article of African commerce.

The hippopotamus is lively and playful in its native waters; it soon learns to avoid man; and, when it cannot retire among reeds for concealment, it dives and remains long under water, raising only its nose to the surface when another breath becomes necessary. The female may sometimes be seen swimming with her young one on her back. The hippopotamus is generally inoffensive, but is occasionally roused to fits of rage, in which it becomes extremely dangerous, particularly to those who pursue it in boats. The voice is loud and harsh, and is likened by Burckhardt to the creaking and groaning of a large wooden door. That the animal is capable of being tamed, and of becoming much attached to man, has been sufficiently proved by the instances of living specimens in London and Paris. The first specimen brought to Europe in modern times, a young one from the Nile, arrived in London in 1850. The hippopotamus, however, sometimes appeared in the spectacles of the ancient Romans. It is very generally supposed to be the Behemoth of the book of Job.

Fossil Species.—A number of species of hippopotamus have been described from the later Tertiary strata; but in those times the distribution was not, as it is now, limited to the African continent. Their remains have been found in India and Madagascar as well as Europe. They occur in fresh-water marls, and in the bone-caves, into which they had been carried for food by the carnivorous animals that used the caves as dens. One species found in England and in considerable abundance in the southern countries of Europe was of a size as much greater than the living species as its companion, the mammoth, was greater than the living elephant.

Hippuric Acid, $C_9H_9NO_3$, is a compound of great interest both to the chemist and to the physiologist. It derives its name from its having been first discovered in the urine of the horse, and that fluid, or the renal secretion of the cow, affords us the best and readiest means of obtaining it. The crystals of hippuric acid are moderately large, colourless, but subsequently becoming milk-white, four-sided prisms, which are devoid of odour, but have a faintly bitter taste. They dissolve readily in boiling water and in spirit, but are only sparingly soluble in cold water and in ether. It is an abundant normal constituent of the urine of the horse, cow, sheep, goat, hare, elephant, &c., and most probably is to be found in the urine of all vegetable feeders. In the human urine of healthy persons living on an ordinary mixed diet it occurs in very small quantity, but it is increased by an exclusively vegetable diet, and in the well-known disease diabetes.

The hippuric acid occurring in the animal organism exists in combination with bases, and chiefly as hippurate of soda and hippurate of lime. The last-named salt can be obtained by the mere evaporation of the urine of the horse. The chief interest of the substance is that it was one of the first to be discovered of a long series of complex bodies, which we now know are formed synthetically in the animal body. Hippuric acid readily splits into benzoic acid and glycocoll. If benzoic acid is administered it is excreted as hippuric acid, combining with glycocoll in the body. In herbivorous animals the benzoic acid is largely derived from the food; in animal feeders even in starvation it occurs in small amount in the urine, and we must therefore conclude that its forerunners may be derived from the metabolism of the tissues. That certain bodies closely allied to benzoic acid may be so formed has now been experimentally demonstrated, while glycocoll can also be proved to be so produced. At one time the belief was entertained that these bodies were combined in the liver; but more recent research has shown that the synthesis chiefly takes place in the kidneys.

Hippurites, a very remarkable genus of fossil bivalves, peculiar to the Cretaceous strata, and so abundant in some of the Lower Chalk beds of the Pyrenees and other places that the series has received from some continental geologists the name of Hippurite Limestone. The external form of the shell is so anomalous that the genus has been tossed about by naturalists in an extraordinary manner; some having called it a coral, others an annelid, others a barnacle, and so on, though the majority held it to be at least a mollusc. The investigations of S. P. Woodward showed that the Hippurites were divergent bivalves. The right valve is very large, and elongated into a cone, while the left valve is inconspicuous, often like a lid, and perforated by radiating canals. Including allied genera or sub-genera —e.g. Radiolites and Caprinella—there are over a

A Hippurite.

hundred species, all restricted to the Chalk and Chalk-marl.

Hiring. The contract of hiring, called in the law of England bailment for hire, and in that of Scotland location, is of two kinds—the hiring of things, as where household furniture is let to be used in the ordinary way; and the hiring of work, as where a tailor's labour is hired to make a suit of clothes. In hiring of the first kind, hiring of things, it is the duty of the person letting out the thing to deliver it to the hirer, to refrain from interfering with the hirer's use of the thing during the subsistence of the contract, to do nothing to deprive the hirer of the use, to warrant that the thing hired is fit for the use for which it is let, and to keep the thing free from faults and defects inconsistent with the proper use of it, and in suitable order and repair. The hirer acquires no right of property in the thing hired, but acquires its possession and the exclusive right to its use for the period of the agreement. He has to use the thing well and with care, not to put it to any other use than that for which it is let, to restore it at the expiry of the time agreed on, and to pay the stipulated hire. The contract of hiring is a different agreement from those made under what is known to traders as the 'hire-purchase' system, as where a piano is handed over by its owners to a purchaser under the conditions that a certain sum shall be paid periodically as hire, and that after a certain number of such periodical payments have been made the piano shall become the property of the person making the payment. No such contract as one of 'hire-purchase' is recognised by law; and in the cases which have come before the courts under this system the question always is whether the contract, whatever it may be called by the parties, is legally a contract of hiring or a contract of sale. The answer will depend upon the particular terms of each agreement. These, however, are usually so framed as to make the contract, not one of hiring, but one of sale with a suspensive condition that the thing delivered shall not become the property of the person to whom it is sold until he has paid the full number of periodical payments bargained for. These payments, though they may be called hire by the parties to such an agreement, are legally only so many instalments of the price of a thing sold. A piano or other article delivered under such an agreement does not become the property of the holder until all these instalments are paid; and it cannot be attached by the creditors of the holder as an asset in his estate. Nor can it be lawfully sold by the holder. It remains the property of the person letting it out, and he can recover it even from one who has purchased it in good faith from the person by whom it was hired. Hiring of the second kind above mentioned, hiring of work, may be subdivided into (*a*) the hire of services, as where a shoemaker is employed to mend shoes; (*b*) the hiring of care in custody, as where warehousemen or wharfingers are employed to store things; and (*c*) the hiring of the carriage of goods. In cases of the first kind the workman is bound to do the work agreed on, to do it at the time agreed on, to do it well, and to use an appropriate degree of care in performing the particular task. Employees in the last two classes are bound to take ordinary care of the goods entrusted to them, and are responsible for damage done by their negligence. See also LANDLORD AND TENANT, INN, MASTER AND SERVANT, CARRIER, &c.

Hirschberg, a manufacturing town of Prussian Silesia, is romantically situated at the influx of the Zacken to the Bober, 1116 feet above sea-level, and 78 miles WSW. of Breslau by rail. It is the centre of the extensive textile, lace, paper, and other manufactures of the district. Pop. (1875) 12,970; (1885) 15,622; (1890) 16,124.

Hispania. See SPAIN.

Hispaniola ('Little Spain'). See DOMINICAN REPUBLIC and HAYTI.

Hissar, a province of Bokhara, from which it is separated by a southern offset of the western prolongation of the Thian-Shan Mountains. This range forms its northern boundary. The country consists of a series of valleys, radiating from this mountainous background, and lying open on the south, traversed by streams which flow in general south or south-west to join the Oxus or Amu-Daria. The soil is fertile, and yields wheat, flax, cotton, rice, and garden fruits. Copper and rock-salt abound. The inhabitants (number not exactly known) are chiefly Usbegs and Tajiks. They export corn, salt, flax, and sheep to Bokhara. The main route from India to Bokhara passes through the province; and Hissar has its chief access with Bokhara, 230 miles to the north-west, through a celebrated pass called Kohluga or the Iron Gate. The province was annexed by the emir of Bokhara in 1869. The capital is the town of Hissar, with 15,000 inhabitants, on the Kafirnihan River. Its people are noted sword-makers.

Hissar, the capital of a district of that name in the Punjab, on the Western Jumna Canal, 102 miles W. of Delhi. Pop. 14,167. The district of Hissar, lying on the western verge of the Bikanir desert, has an area of 5163 sq. m., and its soil, when watered, is fertile and produces rice, millet, barley, grain, wheat, &c.; but it is mainly a sandy plain, very liable to suffer from drought in dry years. Pop. (1891) 776,006.

Hissarlik. See TROY.

Histology (derived from the Greek words *histos*, 'a web or texture,' and *logos*, 'a discourse') is the science which classifies and describes the structural or morphological elements which exist in the solids and fluids of organised bodies. It is identical or nearly so with general minute anatomy and with microscopic anatomy. Although its origin may be traced to the times of Malpighi (1628–94), who discovered the blood-corpuscles, and of Leeuwenhoek (1632–1723), who, with comparatively imperfect optical means, added much to our knowledge of the minute structure of the tissues, it never made any definite progress till the second decennium of the 19th century, when the compound microscope began to assume its present improved form. It was by means of this microscopico-chemical examination that the structure of the different horny tissues was first clearly exhibited, and it was thus proved that nails, cow's horn, and whalebone are aggregations of individual cells. Portions of the subject are dealt with in our articles on BONE, BRAIN, CIRCULATION, DIGESTION, GLAND, MUSCLE, NERVOUS SYSTEM, &c.; and see ANATOMY. For Vegetable Histology, see VEGETABLE PHYSIOLOGY, BAST, LEAF, TISSUES, WOOD, &c.

In Germany animal histology has been cultivated by Schwann, Henle, Valentin, Remak, Kölliker, Virchow, Leydig, Frey, and a host of others scarcely less distinguished; in Holland it has been actively prosecuted by Donders, Harting, and others; Lebert, Mandl, Robin, and others have contributed to the French literature of the subject; while in Britain the names of Todd and Bowman, of Goodsir, Quekett, Bennett, Sharpey, Clarke, Wharton Jones, Beale, and Huxley deserve honourable notice.

Hit (anc. *Is*), a town of Turkey in Asia, on the Euphrates, 85 miles WNW. of Bagdad, has pits of bitumen, which have been worked from time immemorial, and naphtha-springs. Pop. about 2500.

Hitchcock, Edward, geologist, born at Deerfield, Massachusetts, May 24, 1793, was successively Congregational pastor in Conway, Massachusetts (1821–25), professor of Chemistry and Natural History (1825–45) and of Natural Theology and Geology (1845–64) in Amherst College, of which he was also president from 1845 to 1854. He died on 27th February 1864. He was state geologist of Massachusetts in 1830–44, and of Vermont in 1857–61, and published very full reports, as well as a volume (and supplement) on the *Ichnology of New England* (1858–65). In 1850 he was commissioned by the state to visit and examine the chief agricultural schools of Europe (*Report*, 1851). But he chiefly distinguished himself in the geological department of natural theology, writing *The Religion of Geology and its connected Sciences* (1851), which had a very wide circulation on both sides of the Atlantic. His *Elementary Geology* (1840) was also popular both in America and in England. Hitchcock took an active part in founding the American Association of Geologists and Naturalists, and was its first president in 1840. He was also one of the foundation members of the National Academy of Sciences (1863).

Hitchin, a thriving market-town of Hertfordshire, on the Hiz, through the Ivel a feeder of the Ouse, 32 miles NNW. of London. An important railway junction, it has a fine old parish church, a modern town-hall, a free school (1622), a Friends' school, &c. The principal trade is in corn, malt, and flour; there are several large breweries; and many females are employed in straw plaiting. Lavender has been grown here since 1568, and commercially, for lavender-water, since 1823. Hitchin was a place of some consequence in the days of King Alfred. It was the original seat of Girton College (q.v.). Pop. (1851) 5258; (1891) 8860.

Hitopade'sa (lit. 'salutary counsel'), a famous collection of fables and stories in Sanskrit literature, usually ascribed to the compilation of the Brahman Vishnusarman. It is a popular summary in four books of the larger work, the famous *Panchatantra*, which directly and indirectly has been the source whence a rich stream of folk-tales has flowed westwards over Europe. An edition of the text, with an English translation, was published by F. Johnson in 1864; a French translation by E. Lancereau in 1882.

Hitteren, an island off the west coast of Norway; area, 203 sq. m. Pop. 2700.

Hittites, the English name of a people who waged war with Egypt and Assyria for a thousand years, and who moved on parallel lines with the people of Israel from the call of Abraham to the Captivity. The Hittites have scarcely any record in classical history, but in late years we have much information respecting them from various sources.

First in order and importance are the narratives of the Old Testament. When the Semitic tribe with Abraham at their head moved from Haran to Canaan the Hittites inhabited the land (Gen. xv. 20), and fifty years later Abraham, a wandering sheikh, purchased a grave for his wife from the Hittites, who were then in possession and power at Hebron (Gen. xxiii. 4). The patriarch's family continued to live side by side with the Hittites; and Esau, the *bedawi*, the grandson of Abraham, married two Hittite wives, who 'were a grief of mind unto Isaac and to Rebekah' (Gen. xxvi. 35). During the sojourn in Egypt the Israelites had the promise of occupying the land of the Hittites oft repeated, and from the bush on Horeb the promise was again renewed to bring them 'into the place of the Canaanites, and the Hittites, and the Amorites, and the Perizzites, and the Hivites, and the Jebusites' (Exod. iii. 8). We now see that these peoples are mentioned in their topographical order as viewed from the Egyptian standpoint. The traveller northward from Egypt first came to Canaan, then he reached the Hittite colony in the neighbourhood of Hebron, and finally arrived at the Jebusites, who then inhabited Jebus, afterwards known as Jerusalem. After the exodus the spies found 'the Hittites, and the Jebusites, and the Amorites' dwelling in the mountains whither they had been driven by successive Egyptian invasions. The Hittites were conspicuous among those who opposed Joshua's entrance into the promised land, and the serried lines of Hittite chariots were scattered in confusion by Joshua's army in the decisive battle by Lake Merom. Hittite captains marshalled and led the hosts of David and Solomon, and Hittite ladies were conspicuous in the harems of the same renowned monarchs (1 Kings, xi. 1). King David pushed his conquests and extended his border in 'the land of the Hittites' (the correct reading in 2 Sam. xxiv. 6 being not *Tahtim-hodshi* but '*Kedesh of the Hittites*'); and, in the time of Jehoram, Benhadad of Damascus fled headlong from Samaria with his Syrian horde when an alarm was raised that the Hittites were coming (2 Kings, vii.). The geographical position generally of the Hittites in the time of Joshua was 'from the wilderness and this Lebanon, even unto the great river, the river Euphrates . . . and unto the going down of the sun' (Josh. i. 1–4). This summary of the most important references to the Hittites in the Old Testament covers a period of a thousand years.

Next in importance is the testimony of the Egyptian and Assyrian inscriptions. In the Egyptian inscriptions the Hittites stand out as rivals of the Pharaohs in peace and war from the 12th to the 20th dynasty. As soon as the key was found to the long silent records of Egypt and Assyria the veil began to lift off dark continents of history, and the forgotten but mighty Hittite people began to emerge; and now in the increasing light from Egypt and Assyria they stand before us in broad outline and in incidental detail. The two capitals of the Hittites were Kadesh on the Orontes and Carchemish on the Euphrates. The centre of their empire was in the north, but as an enterprising people they pushed a wedge-like colony down through Syria as far as Hebron and Egypt. According to Brugsch, the Hittites appeared on the Egyptian border as early as the 12th dynasty. The capital of the Hyksos dynasty was Zoan or Tanais, and Mariette declares that one of the Hyksos dynasties was Hittite. In the Old Testament there is a curious statement that 'Hebron was built seven years before Zoan.' This casual statement now seems to indicate the order in which the Hittites consolidated their advance southward. The wave of invasion reached Hebron and made a lodgment there nine years before it swept over the border and made a lodgment in the land of Goshen. The discoveries at Tel-el-Amarna in 1887 throw additional light on the Hittites in Syria and Palestine, and a despatch written on a clay tablet, now at Berlin, contains an urgent request from Egyptian officers in Palestine for Egyptian assistance against the Hittites, then marching southwards.

Thothmes III. came to the throne about 1600 B.C. The monuments of his reign, one of which stands on the banks of the Thames, are very numerous. In the hieroglyphics of Karnak there is a detailed account of thirteen campaigns waged by this Pharaoh against the Hittites. Great battles were fought at Megiddo, at Carchemish, at Kadesh, and elsewhere, and the Egyptian records boast of victories over the Hittites; but the Hittite resistance was not broken, and succeeding years saw

new Egyptian armies marching through the length of Syria against the hereditary foe. On the death of the great Thothmes the Hittites became more formidable, and after about fifty years of constant wars a treaty of peace was concluded between Rameses I. and Saplel the Hittite king.

Seti I. came to the throne two hundred years after the death of Thothmes III., and he at once marched against the Hittites as the 'avenger of broken treaties.' The details of this sanguinary campaign are depicted in the battle scene on the north side of the great temple of Karnak. At this period the Hittites were dominant in Syria, for one of the inscriptions declares that Syria was brought into subjection through Pharaoh's victory over the Hittites.

Rameses II., the Pharaoh of the oppression, succeeded his father, Seti I., and carried on the war in many campaigns. Many temples are adorned with the records of his achievements, the chief of which was his famous battle with the Hittites at Kadesh. Pentaur was present with the Pharaoh as war-correspondent, and he has recorded the events of the day in the world's most ancient epic. A copy of the epic adorns many temples in Egypt, and is written on a papyrus roll now in the British Museum. Kheta-sira had assembled his confederates and allies from many lands, even from Troy, and the battle ended in a draw, followed by an offensive and defensive treaty, and a dynastic alliance. Kheta-sira treats with the Pharaoh on equal terms, and his name stands first in the world's oldest treaty, which was written in Hittite on a silver plate, Egyptian translations of which have come down to us. Kheta-sira went down into Egypt with his eldest daughter, who became Pharaoh's queen, and thus inaugurated an era of peace.

Mineptah, the Pharaoh of the Exodus, loyally maintained the treaty, and 'sent wheat in ships to preserve the lives of the Hittites.' More than a hundred years later Rameses III. waged a cruel war in the land of the Hittites, and it is recorded on the temple of Medinet Abou that he brought back into captivity the king of the Hittites. We thus learn from the Egyptian inscriptions that the Hittites were rivals of the Egyptians from the 12th to the 20th dynasty. The shock of Egyptian invasion exhausted itself at Kadesh and Carchemish, but the centre of Hittite power lay beyond in the broad plains and highlands of Asia Minor, and so they had fresh armies and abundant wealth to enable them to withstand the might of Egypt for a thousand years.

The Hittites occupy an important place in the Assyrian inscriptions. The reign of Sargon of Agade has been placed about the 19th century B.C.; and one date has been deciphered, which if correct would fix that reign about 3800 B.C. Even as early as the reign of Sargon I. the Hittites were a formidable power, and it has been supposed that in the time of the 19th dynasty in Egypt the Hittites occupied Mesopotamia. When we come to the era of Tiglath-pileser I., about 1130 B.C., the Hittites were paramount from the Euphrates to the Lebanon. Tiglath-pileser I. drove back the Hittites from his borders, and for a time made them tributaries, but they soon threw off the Assyrian yoke, and a desperate struggle for supremacy was waged for four hundred years between the empire of Assyria and that of the Hittites. The reign of Assur-nasir-pal (883–858 B.C.) is largely a record of wars with the Hittites. His son, Shalmaneser, undertook thirty campaigns chiefly 'in the land of the Hittites.' The war continued to the close of the king's reign, and was carried on by the kings who succeeded him; and one hundred years later the Assyrians were still in deadly conflict with the Hittites. The Hittites, who first appear in the Assyrian inscriptions in the reign of Sargon I., were destined to disappear from history in the reign of his namesake. Sargon II. came to the throne in 721 B.C., and his first year was distinguished by the capture of Samaria and the captivity of the Israelites, and four years later (717 B.C.) he brought the empire of the Hittites to a close by the defeat of Pisiri and the capture of Carchemish.

Thus ended the mighty empire of the Hittites, having maintained its existence, defying all enemies, longer than the empires of Babylon, or Assyria, or Greece, or Rome. The fact that the frontier towns of the Hittites had continued their resistance to the Assyrian arms, in almost yearly campaigns, throughout successive centuries, suggests that the Hittite empire must have been strong in resources beyond the frontier; and the mention of over 300 geographical Hittite names, in the inscriptions, shows how extended that dominion must have been.

In November 1872 the writer of this article succeeded in making casts of the famous Hamah (q.v.) inscriptions, which he declared to be Hittite remains. The theory, at first received with incredulity, is now admitted, and sculptures of the same character are now found to exist throughout the length and breadth of Asia Minor and northern Syria, from Hamah on the Orontes to Eyuk by the Halys, and from Carchemish on the Euphrates to the Euxine and the Ægean. A beginning has been made in decipherment, but the first steps, though sure, are slow. There is no room for doubt as to their Hittite origin. The cuneiform inscriptions were called Assyrian before Grotefend made the happy guess that led to their decipherment. The hieroglyphics were called Egyptian before Champollion and Birch began to unravel the mysteries of the Rosetta Stone; and it does not seem a violent supposition that the remarkable inscriptions 'in the land of the Hittites' may have been produced by the warlike but cultured people who once inhabited the land.

A set of Hittite inscriptions and sculptures may be seen in *The Empire of the Hittites*, by the present writer (1884; 2d ed. 1886), as well as chapters on Hittite geography, art, and learning, religion and nationality. See also Sayce, *The Hittites: or, the Story of a Forgotten People* (R. T. S., 1888); Léon de Lantsheere, *Les Hittites* (Brussels, 1892); Conder, *The Hittites and their Language* (1898).

Hitzig, Ferdinand, a German biblical scholar, was born 23d June 1807, at Hauingen, in Baden, and educated at Heidelberg, Halle (where the influence of Gesenius determined him in favour of Old Testament studies), and Göttingen. In 1833 he was called to Zurich as professor of Theology, and in 1861 returned to fill the similar chair at Heidelberg. The first work which established his fame was his commentary on Isaiah (1833). Besides a translation of the Psalms, with a commentary (1835–36), he furnished for the *Exegetisches Handbuch zum A. T.* the commentaries on the twelve minor prophets (1838; 4th ed. 1881), on Jeremiah (1841), Ezekiel (1847), Ecclesiastes (1847), Daniel (1850), the Song of Solomon (1855), Proverbs (1858), and Job (1875). This able and combative rationalistic critic is also known by *Die Erfindung des Alphabets* (1840), *Urgeschichte und Mythologie der Philistaer* (1845), *Geschichte des Volkes Israel* (1869–70), &c., and by numerous contributions to the learned journals. He died at Heidelberg, 22d January 1875.

Hivites ('villagers' or 'midlanders'), a Canaanitish people, the main body of which lived in the region from Lebanon and Hermon to Hamath, but who had colonies, apparently isolated, in southern Palestine, as at Gibeon.

H'Lassa. See Lhassa.

Ho. See Hoang-ho.

Hoadly, BENJAMIN, English prelate, was born at Westerham, in Kent, November 14, 1676, and educated at Catherine Hall, Cambridge, of which he became tutor after taking his degree of M.A. Two years after that event he was chosen lecturer of St Mildred in the Poultry, London, and with this office two years later still combined that of rector of St Peter-le-Poer. Hoadly figures amongst the principal controversial writers of the 18th century, ranking amongst the 'rationalists,' and defending the cause of civil and religious liberty against both the crown and the clergy. He carried on a controversy with Dr Atterbury on the extent of the obedience due to the civil power by ecclesiastics in such a way as to secure the applause of the House of Commons. His Low Church principles made him an opponent of Sacheverell, whom he contended against in the pulpit. As a reward for his attitude in this matter, and for his zeal against the doctrine of non-resistance, he was made a hero of by the Whigs. Through their instrumentality he was in 1710 presented to the rectory of Streatham in Surrey; and in 1715, when the accession of George I. had secured the triumph of Whig principles, Hoadly was made Bishop of Bangor. In 1717 he preached before the king a sermon on the text 'My kingdom is not of this world,' in which he endeavoured to show that Christ had not delegated his powers to any ecclesiastical authorities. Out of this originated the famous Bangorian Controversy, regarding which Hallam says that it was 'managed, perhaps on both sides, with all the chicanery of polemical writers, and is disgusting both from its tediousness and from the manifest unwillingness of the disputants to speak ingenuously what they meant.' The controversy branched off into such a multiplicity of side-issues, and produced such an extraordinary number of pamphlets (in July 1717 alone no less than seventy-four appeared), that the main question became almost irrecoverably lost in a tangle of extraneous matter. The public excitement it created is said to have been so great that business in London was virtually at a standstill for some days. The dispute had, however, one important consequence—the indefinite prorogation of Convocation (q.v.). In 1721 Hoadly was transferred to the see of Hereford, in 1723 to that of Salisbury, and in 1734 to that of Winchester. He died at Chelsea, April 17, 1761. His *Collected Works* were published by his son in 1773, with Life prefixed.

Hoang-ho ('Yellow River'), or simply Ho, one of the principal rivers of China, more than 3000 miles in length, rises in the plain of Odontala, south of the Kuen-Lun Mountains, and has a tortuous course, described in the article CHINA, Vol. III. pp. 184, 185. From the southernmost corner of the province of Chih-li, which it crosses, the Yellow River flowed until recently eastward to the ocean, 650 miles distant, in 34° lat.; but in 1851–53 this wayward and turbulent stream, which is said to have shifted its course nine times in 2500 years, turned off near Kaifung-foo in a north-easterly direction. Since then it discharges its waters into the Gulf of Pechili, some 500 miles north of its former mouth, the mountainous province of Shan-tung lying between the two. The river is little used for navigation, Chinese vessels being unable to stem its impetuous current. In some parts of its eastern course, as in the case of the Po, the river-bed is above the great plain through which it passes. The embankments requisite for averting inundations are a source of never-ending expense to the government, and their yielding to floods a frequent cause of desolation to extensive districts of country. In 1887, by a dreadful inundation in Ho-nan, 'China's sorrow' destroyed millions of lives. The measures subsequently taken by the Chinese government to regulate the course of the river proved futile. About 170 miles of the upper course of the Hoang-ho were explored for the first time by Prejevalsky in 1880. The vast quantity of sediment conveyed to the sea by this river, giving it its colour and name, is taken up in that part of its course which lies between the provinces of Shan-hsi and Shen-hsi; beyond which its waters are remarkably clear.

Hoare, SIR RICHARD COLT, antiquary, was born at Stourhead, in Wiltshire, on 9th December 1758. The son of a banker, and after his accession to the baronetcy in 1787 a gentleman of wealth, he devoted his leisure time to travel and antiquarian pursuits. The results of his labours in these departments appeared in a translation of Giraldus Cambrensis (1806), *A Classical Tour through Italy and Sicily* (1819), *Ancient History of Wiltshire* (1812–19), and *Modern History of South Wiltshire* (1822–44). He died at Stourhead, 19th May 1838. See *Gentleman's Magazine*, July 1838.

Hobart (till 1881 known as Hobart Town), the capital of Tasmania, stands on the estuary of the Derwent, about 12 miles from its mouth, in the south of the island. The city forms nearly a square, built on several hills, covering an area of about 1300 acres. A fine marine view may be obtained from Mount Pleasant. Besides Government House, the houses of parliament, and the government official buildings, Hobart has a museum, library, two cathedrals, thirty-five churches, and is well supplied with schools, hospitals, and hotels. The hospital for the insane is at Cascade, 2 miles distant. The water-supply is derived from springs on Mount Wellington. The town is lighted with gas, and tramways have been laid. The park known as the Queen's Domain has fine drives, and covers 1000 acres. In Franklin Gardens, in the centre of the town, are statues to Sir J. Franklin, a former governor of Tasmania, and Dr Crowther. The fine natural harbour and quay accommodate ships of the largest size; and there are three first-class patent slips. The cooler and more invigorating air of Hobart attracts large numbers of summer visitors from Australia. The chief industries are the manufacture of flour and jam, tanning, and iron-founding. Hobart has railway communication with Launceston, 133 miles distant, and frequent steam communication with Melbourne (443 miles NW.) and Sydney, and ports in New Zealand. Founded in 1804, the town was incorporated in 1857. The suburbs include New Town, Queenborough, Wellington, Glenorchy, Risdon, and Bellerive. About half-a-dozen daily and weekly newspapers are published. Pop. (1871) 19,092; (1891) 24,905.

Hobart Pasha, the HON. AUGUSTUS CHARLES HOBART-HAMPDEN, third son of the Earl of Buckinghamshire, was born at Waltham-on-the-Wolds, in Leicestershire, on 1st April 1822, and in 1836 entered the British navy. He first served against the slavers in Brazilian waters, then in the Baltic during the Crimean war, and there materially assisted in the capture of Bomarsund, in the attack on Åbo, and in the bombardment of Sveåborg. Shortly after the conclusion of the war he retired on half-pay. On the outbreak of the civil war in America he, as 'Captain Roberts,' took command of a blockade-runner, and several times got through the naval cordon that the North had established along the coasts of the Southern States, his adventures being most exciting and his escapes marvellous.

Lastly, he entered the service of Turkey (1867), and for his great services in checking the Greek blockade-runners to Crete in that year was raised to the rank of pasha and made admiral of the Ottoman fleet. On the outbreak of the Russo-Turkish war (1878) he took command of the Turkish Black Sea fleet. After each of these last pieces of active service his name was struck off the British Admiralty list, but on each occasion subsequently restored. He died on 19th June 1886 at Milan. He wrote *Sketches from My Life* (edited by his widow, 1887), and a book entitled *Never Caught* (1867), giving an account of his exploits during the civil war in America.

Hobbema, MEINDERT, landscape-painter, born in 1638, probably at Amsterdam. Few particulars of his life are known. He is believed to have studied art under Jacob Ruysdael, whose name appears as a witness to his marriage at Amsterdam, 2d October 1668, to Eeltije Vinck, who predeceased him in 1704. He died in poverty, and was buried in the Westerkerkhof, Amsterdam, 14th December 1709. His art usually deals with quiet subjects of Dutch cottage and woodland scenery, and these are treated with a skill which entitles the artist to rank along with Ruysdael at the very head of the landscape-painters of Holland. His works are subdued in tone, and finished with extreme care, yet with a singularly free and spirited touch, and are excellent in composition and lighting. Their figures were executed by Berchem, Adrian Vandevelde, and Lingelbach. Smith has catalogued 142 of his works, which now command very large prices, small landscapes from his hand having fetched from £5000 to £10,000. Seven of his works are in the National Gallery, London, and of these 'The Avenue, Middelharnis, Holland,' formerly in the Peel and Vander Pot collections, is an exquisite example. See E. Michel, *Hobbema et les Paysagistes de son Temps* (1890).

Hobbes, THOMAS, was born at Malmesbury on the 5th April 1588, and was the son of the vicar of Charlton and Westport adjoining that town. About the age of fifteen he was entered at Magdalen Hall, Oxford, where he was put through the usual course of Aristotelian logic and physics. His intellectual interests remained entirely unawakened, and long afterwards he attacked the universities in no measured terms for their failure to keep pace with the time. At the age of twenty, having taken his degree and quitted Oxford, he was recommended to Lord Hardwick, afterwards Earl of Devonshire, as tutor to his eldest son. This was the beginning of an intimate connection with that great family, which lasted through his long life. In 1610 he went abroad with his pupil, and made the tour of France and Italy. After his return he still continued to live with the Cavendish family, and his residence in London afforded him opportunities of becoming acquainted with Bacon, Herbert of Cherbury, Ben Jonson, and other distinguished men of the time. The first ambition to awake in him was that of the scholar, and he devoted his abundant leisure to a critical reading of the classical poets and historians. The outcome of these studies was his translation of Thucydides, which appeared in 1628, when he had already reached the mature age of forty. The Civil War was already looming in the distance, and in the choice of subject we may discern Hobbes's strong interest in politics—an interest which ultimately dominated his whole philosophy. The Earl of Devonshire died in 1626, and to Hobbes's great grief the second earl, his pupil, followed his father to the grave in 1628. Next year Hobbes accepted an engagement as travelling tutor to the son of Sir Gervase Clifton, and in this capacity paid a second visit to the Continent; but in 1631 his connection with the Devonshire family was resumed. By the desire of the dowager-countess he undertook the education of the young earl, the son of his former pupil, then only thirteen. From 1634 to 1637 they travelled abroad, and on this occasion Hobbes came into contact with Galileo in Italy, while in Paris he was admitted to the scientific and philosophical circle of which Père Mersenne was the centre.

Since 1629, when chance introduced him to a copy of *Euclid's Elements*, he had been an ardent student of geometry, and about the same time or a little later he began to be powerfully drawn to the new 'mechanical philosophy' of Galileo. In motion and the laws of motion he seemed to see a universal principle of explanation, and when he returned to England in 1637 it was with the outline of a comprehensive philosophical system already before his mind. Descartes, whose *Discourse on Method* appeared in that year, was also an adherent of the new physics, but limited and supplemented its explanations by the subjective principle of self-consciousness. Hobbes did not occupy himself (except incidentally) with the philosophical question of knowledge, but contented himself with giving an objective explanation of sensation and all mental facts in terms of motion. Regarded as the object of science, the world consisted, in Hobbes's view, of natural bodies (inanimate and animate) and political bodies, or organised aggregates of living men. Natural philosophy and civil philosophy therefore cover the whole ground; but, as the explanation of civil institutions is to be found in the nature of man, man stands out from among all other natural bodies, and forms, as it were, a bridge between nature and society. Accordingly Hobbes planned three systematic treatises, *De Corpore*, *De Homine*, *De Cive;* but the pressure of political events prevented him from publishing his ideas in their natural sequence, and some parts of the scheme are much less fully worked out than others. On his return to England he continued to live with the young Earl of Devonshire, and was on intimate terms with Lord Falkland, Hyde, and others engaged in the political struggles of the time. The need of a political philosophy which would put an end to anarchy by a true theory of the governing power became every day clearer to him, and in 1640 he wrote 'a little treatise in English' in defence of the royal prerogative. This is preserved in MS. under the title of *The Elements of Law, Natural and Politique*, and is identical with the two treatises, *Human Nature* and *De Corpore Politico*, published separately ten years later. Fearful lest the Parliament should take notice of his treatise, Hobbes fled in the same year to Paris, which continued to be his home till 1651.

He was welcomed by his scientific friends, and Mersenne induced him to contribute to Descartes' *Meditations* a series of criticisms thereon. But the political needs of the time still lay nearest his heart, and in 1642 appeared the *De Cive*, a fuller statement of his theory of government. Very few copies of this edition were struck off, and the book appeared with a new title in 1647 as *Elementa Philosophica de Cive*. In 1650 appeared the two treatises already mentioned, and in 1651 he issued a vigorous English translation of the *De Cive* (*Philosophical Rudiments concerning Government and Society*) by way of introduction to the comprehensive English work on which he had been engaged for several years. *Leviathan* was printed in England, and appeared in the summer of 1651. Its rationalistic criticism and its uncompromising reduction of religion to a department of state mortally offended the royalist clergy of the exiled court. Hobbes had been mathematical tutor to

Prince Charles in 1647, and the latter always continued to take a friendly interest in his old preceptor; but on the publication of *Leviathan* the author was informed that the young king refused to see him. With constitutional timidity he once more took refuge in flight. He returned to England in the end of 1651, and sent in his submission to the government of the Commonwealth, it being one of the principles with which *Leviathan* concludes that an ordinary citizen has a right to turn to a new power that can give protection, however little he may approve of the circumstances of its origin. Hobbes settled in London to work out the remaining parts of his scheme. The *De Corpore* appeared in 1655, and the *De Homine*, a rather perfunctory revision of the old *Human Nature* (with expansion on the side of optical theory), in 1658. From 1654 onwards Hobbes was engaged in almost perpetual controversy, first with Bramhall on liberty and necessity, and then with Ward, Wallis, and Boyle in defence of his own hopelessly indefensible mathematical ideas, which involved the quadrature of the circle and similar absurdities. The second controversy dragged over a quarter of a century, Hobbes's last blow being delivered after he had completed his ninetieth year. After the Restoration Charles granted him a pension of £100, and is said to have been always delighted with the old man's wit and repartees, but the bishops and the church party looked with no favour upon the author of *Leviathan*. A series of attacks upon the book began to appear, and it was condemned by the House of Commons in 1666. Three of his later works—*Behemoth*, *The Common Laws*, and a metrical *Historia Ecclesiastica*, all written about 1670—he was obliged to leave unpublished (though *Behemoth* issued surreptitiously from the press just before his death). A collected edition of his Latin works in 1668 had to appear at Amsterdam. At the age of eighty-four Hobbes amused himself by writing an autobiography in Latin verse, and within the next three years he completed a verse translation of the *Iliad* and the *Odyssey*. In 1675 he left London, and the rest of his days were spent at Hardwick and Chatsworth, the two Derbyshire seats of the Devonshire family. He died at Hardwick on the 4th December 1679, in his ninety-second year.

Hobbes stands between Bacon and Locke as the second in order of time of the great English philosophers, but he stands apart from both. It is by his contributions to scientific psychology, to ethics, and to political theory that he takes rank as an original thinker. In the present century attention has been drawn afresh to his acute psychological analyses by James Mill and the English associationists. His ethical theory, based on pure selfishness on the one hand and the arbitrary prescription of a sovereign power on the other, determined negatively the whole course of ethical speculation in England for a hundred years. Cumberland, Cudworth, and Clarke, and in a somewhat less degree Shaftesbury and Butler, are in the first instance critics and opponents of Hobbes. His political absolutism, however, is the most famous part of his speculations. The state of nature, he argues, is a state of war and insecurity (*homo homini lupus*). Moved by a desire to escape from the intolerable evils of such a condition, human beings enter into a species of contract by which they surrender their individual rights, and constitute a state under an absolute sovereignty. The sovereign power need not be monarchical (though Hobbes's individual preference is for that form of government), but, whatever form it assume, it is absolute and irresponsible. It was far from the intention of Hobbes to justify tyranny, but *Leviathan* was to him like 'a mortal god,' the only guarantee for security and settled government. The theory was substantially adopted by Spinoza; and, stripped of their accidental features, Hobbes's ethico-political ideas had great influence upon the philosophical Radicals of the 19th century. No account of Hobbes would be complete which omitted to mention his admirably clear and trenchant style. A collected edition of his works was published by Sir W. Molesworth in 16 vols. (1839–45). The best account of his life and his place in the history of thought is to be found in Professor Croom Robertson's *Hobbes* (Blackwood's 'Philosophical Classics,' 1886).

Hobby. See FALCON.

Hobhouse, JOHN CAM, the friend of Byron, was born in 1786, and was educated at Westminster and Trinity College, Cambridge. His *Journey through Albania with Lord Byron* he published in 1813. An advanced Liberal in politics, he stood for Westminster in 1818 without success, but was returned by a large majority in 1820, and sat later for both Nottingham and Harwich. Successively Irish Secretary, First Commissioner of Woods and Forests, and President of the Board of Control, he succeeded to his father's baronetcy in 1831, was created Baron Broughton in 1851, and died without male heirs, 3d June 1869, when the peerage became extinct, while the baronetcy passed to his nephew.

Hoboken, a city in New Jersey, on the west bank of the Hudson River, adjacent to Jersey city, and opposite New York, with which it is connected by several steam-ferries. It is the terminus of the Delaware, Lackawanna, and Western Railroad, and has a large shipping trade, especially in coal; iron-castings and lead-pencils are among the principal manufactures; and three lines of European steamships start from the port. The Stevens Institute of Technology here is one of the chief schools of its kind in the United States. Pop. (1880) 30,999; (1890) 43,648. The name of this city commemorates in the New World a village to the south-west of Antwerp, with a new fort and new docks.

Hobson-Jobson, a term given by English soldiers in India to the Moharram festival; being a corruption of the Shiite cry (see SHIITES), *Ya Hasan! Ya Hosain*. The name was adopted for the Anglo-Indian glossary by Colonel Yule and Mr Burnell (1886).

Hoccleve, or OCCLEVE, THOMAS (probably so named from the village of Hoccleugh in Northumberland), an English poet of whom but little is known save that he was born about 1368, was a clerk in the Exchequer, and was writing verse so late as 1448. His chief work is a free, and it must be confessed tedious, version of the *De Regimine Principum* of Egidius Romanus, over five thousand lines in length, and written in Chaucer's seven-line stanza. A prologue, about one-third of the whole in length, begins the work, and here the author tells us a good deal about himself and his troubles. The most interesting passage is that in which he speaks out his grief for the death of his great master Chaucer, the 'floure of eloquence' and 'mirrour of fructuous entendement.' The poem was edited by T. Wright for the Roxburghe Club in 1860. Many other poems are ascribed to Hoccleve, some still unprinted. Some of these are stories from the *Gesta Romanorum*, as that of Jonathas, son of King Darius, and the wicked woman, which was modernised by W. Browne and printed in his *Shepheards Pipe* (1614), where he pays his original a most graceful poetical compliment far beyond his deserts. His *Minor Poems* and his *Complcint* have been edited by Dr Furnivall for the Early English Text Society.

Hoche, LAZARE, one of the most eminent generals of the French Republic, was born of poor parents, 25th June 1768, at Montreuil, a faubourg of Versailles. Enlisting at sixteen, he rapidly obtained promotion by his courage and capacity, and was given in 1793 the command of the army of the Moselle, for his defence of Dunkirk against the Duke of York. Here he tried to cut off the communication between the Prussians and Austrians, and, although foiled by the superior forces of the Duke of Brunswick, yet managed to drive the Austrians out of Alsace. His next important service was putting an end to the civil war in La Vendée, which he accomplished with great prudence and moderation. He was appointed to command the troops in the unfortunate expedition for the conquest of Ireland (1796), but the ships were soon scattered by the storms. Soon after he was placed in command of the army of the Sambre and Meuse. On the 18th April 1797 he crossed the Rhine at Neuwied, and had defeated the Austrians in several battles, when his career was stopped by the armistice concluded between the Archduke Charles and Bonaparte at Leoben. After the 18th Fructidor he was suddenly taken ill in the camp at Wetzlar, and died, 18th September 1797. There are Lives by Rousselin (1798), Dourille (1844), Desprez (1858), and Dutemple (1879).

Hochelaga. See MONTREAL.

Hochheim, a town of Prussia, in Hesse-Nassau, on the right bank of the Maine, 3 miles E. of Mainz. Here is produced the excellent white wine known as *Hochheimer*, whence was derived, before 1625, the English name *Hock*, now applied loosely to almost any white Rhenish wine. Pop. 2804.

Hochkirch, or HOCHKIRCHEN, a village in Saxony, a few miles E. by S. from Bautzen, was the scene of a battle between the Austrians and Prussians (14th October 1758) during the Seven Years' War. Frederick II., with an army of 30,000 strong, was attacked under cover of a thick fog by Marshal Daun, with 65,000 Austrians, and compelled to retire to the heights of Drehsa. Frederick lost 9000 men killed and wounded and 101 cannon. He and most of his generals were wounded, and Marshal Keith and Prince Francis of Brunswick were killed. The Austrians lost 6000 men.

Höchstädt. See BLENHEIM.

Hock. See HOCHHEIM, WINE.

Hocktide, or HOKETIDE, a popular anniversary which used to be celebrated on the Monday and Tuesday following the second Sunday after Easter. On one day, generally on the Tuesday, the women held the roads and streets, and stopped all men who came their way, and having bound them with cords, only set them at liberty after they had paid a small sum of money. On the other day the men had their turn, and collected from the women. The custom goes back to the 13th century, but became obsolete in the 18th. For a curious survival or reminiscence of the custom still practised at Hungerford, in Berkshire, see *Chambers's Journal*, 1888.

Hodeida, a seaport of Yemen, in Arabia, situated on the Red Sea, whence are exported coffee, hides, cattle, fruits, and mother-of-pearl. Pop. about 20,000.

Hodge, CHARLES, an American theologian, was born in Philadelphia, 28th December 1797. He graduated at Princeton College in 1815, and in 1822 became a professor in the Princeton Theological Seminary, where he remained till the close of his life. He was founder and long the editor of the *Princeton Review;* and besides numerous essays, &c., he was the author of commentaries on Romans, Corinthians, and Ephesians, of a history of the Presbyterian Church in America (1840), and of the well-known *Systematic Theology* (3 vols. 1871–72), now a standard work of the Calvinistic churches. In 1872 he was presented with a sum of $15,000, and a professorship bearing his name was founded in his honour. He died 19th June 1878. See *Charles Hodge*, by E. L. Patten (1889).—His son, ARCHIBALD ALEXANDER (1823–86), succeeded his father at Princeton in 1878. He wrote *Outlines of Theology* (1860), works on the Atonement and the Confession of Faith, and a Life of his father (1880). His *Popular Lectures* were published in 1887.

Hodgkin, THOMAS, D.C.L., born of Quaker stock at Tottenham in 1831, became a banker in Newcastle, but is known for *Italy and her Invaders* (vols. i.–vii. 1880–99) and other learned works.

Hodgkinson, EATON (1789–1861), a Manchester engineer, became the great authority on iron beams, and was professor of Engineering in University College, London.

Hodgson, BRIAN HOUGHTON (1800–95), orientalist, was born near Macclesfield, entered the East India Company's service in 1818, was Resident in Nepal from 1820 to 1843, and settled in England in 1858. He wrote some 170 very valuable papers on the ethnology, languages, and zoology of Nepal and Tibet, sent home 354 MSS., on which our knowledge of northern Buddhism is mainly based, and made a collection of 10,500 birds. He was F.R.S., &c. See Life by Sir W. Hunter (1896).

Hodograph (Gr. *hodos*, 'a way') of a moving particle is the curve passing through the extremities of those lines which, drawn from a fixed point as origin, represent in direction and magnitude the velocities of the particle at the different points of its path. It is a velocity diagram of a particular kind. Just as the tangent to the path at any point gives the direction of motion of the particle at that point, so the tangent to the hodograph at the corresponding point gives the direction in which the velocity is changing —i.e. the direction of the acceleration. Thus, if the hodograph is a straight line with origin anywhere outside it, we see that the acceleration is constant in direction, for a straight line is its own tangent. Another conclusion at once deducible is that the velocity resolved perpendicular to the direction of the acceleration is always the same, being given by the perpendicular from the origin upon the line. If, in this case, the acceleration is also constant in amount, we obtain the hodograph of the parabolic motion of a projectile. As another simple case, let the hodograph be a circle, centre the origin. Here the speed of the particle in its path must be constant; and further, the acceleration is perpendicular to the velocity, having the effect of changing the direction only of motion. If, in this case also, the acceleration is given as constant in amount, then the line representing the velocity in direction must rotate uniformly. Hence the path must be such that the angle between the tangents at two points must be proportional to the length of the arc joining them. In technical language, the path must be a plane curve of constant curvature—i.e. either a straight line or a circle, obviously the latter in this case. Thus, under an acceleration constant in amount and always perpendicular to the direction of motion, and to a fixed direction in space, the particle will describe a circle with constant speed, the radius of the circle being a third proportional to the magnitude of the acceleration and the speed. The name hodograph was invented by Sir W. R. Hamilton, who made many elegant applications of its properties to dynamics. In virtue of the aberration of

light, every star describes a projection of the hodograph of the earth's motion in its orbit—i.e. the projection of a circle. The properties of the hodograph are treated in all modern treatises on the dynamics or kinematics of a particle.

Hodometer. See PEDOMETER.

Hodson, MAJOR WILLIAM STEPHEN RAIKES, English soldier, usually known as Hodson of Hodson's Horse, was born at Maisemore Court, near Gloucester, on 19th March 1821. Choosing the life of a soldier, he joined the Indian army in 1845, and immediately got his first experience of warfare in the battles of the first Sikh war. In 1847 he was appointed second in command of the Punjab corps of Guides, a body of irregular native troops raised for the protection of the north-west frontiers of India against the marauding hill-tribes. From 1849 to 1852 Hodson was employed in the work of civil government in the Punjab. Then, being made commandant of the Guides corps, he did excellent service on the turbulent frontier. But in 1856 he was deprived of his command on account of irregularities in the regimental accounts and of his unjust treatment of the troops and natives under his authority. In the crisis of the Mutiny, however, he was appointed head of the intelligence department in the army engaged before Delhi, and was commissioned to raise a new regiment of irregular cavalry, which became known as Hodson's Horse. With this body of men Hodson took part in the siege of Delhi and in the subsequent operations down to the siege of Lucknow. After the fall of Delhi Hodson discovered the Mogul sovereign and his sons; these last he shot dead with his own hand at the time of capture. He himself was shot on 11th March 1858, during the assault on a royal palace in Lucknow, and died on the following day. As a leader of irregular native soldiery, Hodson won unqualified praise for his boldness and skill; his wild troopers were warmly attached to him. But he seems to have been of an imperious temper, which sometimes led him to commit acts of violence and injustice. In money matters he was certainly irregular; and he has been accused of 'looting' in war.

See Rev. G. Hodson's *Hodson of Hodson's Horse* (4th ed. 1883); and compare R. Bosworth Smith's *Life of Lord Lawrence* (especially appendix to vol. ii., 6th ed. 1885), and T. R. E. Holmes's *Four Famous Soldiers* (1889), though none of the three is absolutely satisfactory in his estimate of Hodson's character.

Hoeven. JAN VAN DER, Dutch naturalist, was born on 9th February 1801, at Rotterdam. After studying medicine at Leyden, and zoology at Paris, he established himself as a physician in his native town; and in 1835 he was elected to the professorship of Zoology at Leyden. He died on 10th March 1868. His most important work is *Handboek der Dierkunde* (1827-33), of which a second edition, entirely recast, appeared in 1846, and an English translation by Clark, with important additions by the author and the editor, in 1856-58. Most of his other works are memoirs.—His brother, CORNELIS PIETER VAN DER HOEVEN (1792-1871), was professor of Medicine in the university of Leyden (1824-71), and the author of *De Historia Medicinæ* (1842), *De Historia Morborum* (1846), and other important works on pathology and the history of medicine.

Hof, a town of Bavaria, on the Saale, 30 miles NE. of Baireuth, has extensive manufactures of ironwares, cottons, and woollens; cloth has been made here since the 15th century. There is a hospital, founded in 1262. Hof, almost entirely rebuilt since its destruction by fire in 1823, is closely associated with Jean Paul's earlier years. Pop. (1875) 18,267; (1890) 24,445.

Hofer, ANDREAS, the patriot leader of the Tyrolese in 1809, was born at St Leonhard, in the valley of Passeier, on 22d November 1767. For a century and a half his forefathers had been landlords of the inn 'Am Sand.' Although little higher in the social scale than a peasant, his force of character was such that, when in 1809 he summoned the people of the Tyrolese valleys to arms to drive out the French and the Bavarians, they responded with alacrity and enthusiasm, eager to show their love for their emperor and the holy church. In seven weeks he twice defeated the Bavarians, twice expelled them from Innsbruck, and finally swept them clean out of the Tyrol. As the armistice concluded between Austria and France after the battle of Wagram left Tyrol and Vorarlberg out in the cold, the French again inundated their valleys with some 40,000 men. But again Hofer in eight days routed the foe and retook Innsbruck. For the next two months Hofer was the actual military governor and civil ruler of his native land. By the peace of Vienna (October 14) the emperor of Austria again left Tyrol and Vorarlberg at the mercy of his enemies. Hofer, after some hesitation as to the wisdom of submission, once more took up arms; but this time the French and Bavarians were too strong for him. They steadily subdued one valley after another; and Hofer, seeing that the struggle was hopeless, disbanded his followers and took refuge in the mountains in the end of November 1809. But two months later his hiding-place was betrayed to the French, and Hofer was captured on 27th January, carried to Mantua, tried by court-martial, and shot on 20th February 1810. The 'Sandwirth' or 'landlord of the Sand' still lives in the memory of his people, and is the hero of many patriotic ballads. His statue, by Schaller, stands in Innsbruck.

See Hormayr, *Das Land Tirol* (1845); Egger, *Geschichte Tirols*, vol. iii. (1880); and memoirs by Wolfsgruber (3d ed. 1864), Hegel (1874), and Stampfer (1874).

Hoffmann, AUGUST HEINRICH, commonly called HOFFMANN VON FALLERSLEBEN, poet and philologist, was born 2d April 1798, at Fallersleben, in the district of Lüneburg. At Göttingen and Bonn he occupied himself with philological and literary studies, especially the study of his native language and literature. From 1830 to 1838 he was keeper of the university library of Breslau, and professor of the German Language there from 1835. The publication of his *Unpolitische Lieder* (Unpolitical Lays) in 1842 cost him his professorship. For some years he led a wandering life in Germany, Switzerland, and Italy, until in 1860 he became librarian to the Duke of Ratibor at the castle of Korvei, on the Weser, where he died on 19th January 1874. His principal philological and antiquarian works are *Horæ Belgicæ* (1830-62), *Reinke Vos* (1834), *Geschichte des Deutschen Kirchenliedes* (1832; 3d ed. 1861), collections of ancient German Political (1843) and Social (1844) songs, *Specimen zur Deutschen Literaturgeschichte* (1844), *Die Deutsche Philologie* (1836), and *Findlinge* (1859-60). Hoffmann's own poetry often approaches good *Volkslieder* in its simplicity, tenderness, and playful banter; and for these songs he produced many admirable tunes. His political poetry contributed to the preparation of the political fermentation of 1848. The *Gedichte* appeared in 1834 (8th ed. 1875), and he published numerous collections of songs, as *Allemannische Lieder*, *Soldatenlieder*, *Kinderlieder*, &c. He wrote an autobiography in 6 vols. (*Mein Leben*, 1868-70). See Wegner's *Hoffmann von Fallersleben* (1869-70), and Gottschall, *Porträts*, vol. v. (1876).

Hoffmann, ERNST THEODOR WILHELM, German writer, musical composer and critic, and

caricaturist, was born at Königsberg on 24th January 1776. (Later in life, to show his admiration of Mozart, he substituted for Wilhelm the name Amadeus.) Hoffmann qualified himself for a legal career, and in 1779 was appointed assessor in a court at Posen. But his irrestrainable love of caricature got him into trouble with his superiors, and he was degraded to an inferior post at Plock. Recovering ground again, for he was all his life long most exemplary in the discharge of his official duties, he was transferred to Warsaw (1804); but the occupation of that city by the French two years later threw him entirely out of office. For the next ten years he led a very precarious existence, being often on the verge of want, yet always painting, composing music, and leading a wild and merry life. His great ideal was to live for and by art, especially music, and in 1808 he was for two months director of the theatre at Bamberg. During these same years he wrote a remarkable essay on Mozart's *Don Juan*, and composed an opera on Fouqué's *Undine*. In 1815 he was enabled to resume his career in the service of Prussia; and from 1816 down to his death in 1822 (25th June) he held a high position in the supreme court at Berlin.

His career as an author did not properly begin until 1814. But his tales cannot be rightly understood without some acquaintance with the strange personality of the writer—a little restless man, with a Roman nose and thin lips, and hawk-eyed, a brilliant talker, full of drollery and wit, vain, wayward, fantastic to an extreme, the child of impulse, and the bond-slave of his wild imagination. Educated on the dreams and ideals of German romanticism at the period of its most exuberant growth, he became himself the arch-priest of ultra-German romanticism. At Posen, at Warsaw, at Bamberg, and in his last years at Berlin, he was the brilliant centre of the literary and artistic Bohemianism of the place. Amid the riot and revelry at Posen he learned two of the lasting lessons of his lifetime, to wit, that company—amusing company—and much rum were essential to his happiness. A fierce hater of dullness, Hoffmann waged incessant war upon the stiff-necked sticklers for routine and commonplace conventionalism, and upon the dilettanti who dealt so glibly in the phrasemongery of art-criticism. His wit constantly bubbled over in irony, ridicule, sarcasm, and was often both savage and malicious. His imagination was inexhaustible, but utterly undisciplined, wild, and fantastic, yet wonderfully vivid. Apart from music and painting, nothing fettered his interest so keenly as the extravagant and the marvellous, the grotesque, the weird, and the horrible. An impressionist above all things, Hoffmann's literary strength lies in his power of graphic and vivid description: he describes what he actually saw and felt, and he describes, as a painter paints pictures, in the spirit of concrete realism. He used to affirm that he did actually see the imps and hobgoblins and nightmare apparitions which his perfervid imagination conjured up before him. In short, Hoffmann's tempest-tossed soul was put in such jeopardy by his uncontrollable imagination, conjoined with his lack of firm principle, that it barely escaped being wrecked upon the rock of insanity.

His shorter tales, upon which his reputation as a writer mainly rests, were mostly published in the collections entitled *Phantasiestücke in Callot's Manier* (1814), *Nachtstücke* (1817), and *Die Serapionsbrüder* (1819–25). His longer works include *Elixiere des Teufels* (1816; Eng. trans. 1824), *Seltsame Leiden eines Theaterdirektors* (1818), *Klein Zaches* (1819), and *Lebensansichten des Katers Murr* (2 vols. 1821–22), this last being partly autobiographical. Of his fairy tales *Der Goldene Topf* was translated by Carlyle (1827). Hoffmann's *Ausgewählte Schriften* appeared in 10 vols. in 1827–28, the latest and the most complete edition of his *Gesammelte Schriften* in 15 vols. in 1879–83. Collections of his tales have been translated into English in 1826 (Gillies), 1885, with biography (Bealby), and 1886 (Ewing). His writings, and translations and imitations of them, have been very popular in France. See Hitzig, *Hoffmann's Leben* (1823); Funck's *Erinnerungen* (1836); and Carlyle's *Miscellaneous Essays*, vol. i.

Hoffmann, Friedrich, a German physician, was born at Halle, 19th February 1660, and died in that city, 12th November 1742. On the conclusion of his studies at Jena and Erfurt he commenced practice at Minden in Westphalia in 1685, but three years later removed to Halberstadt. In 1693 he was appointed to the professorship of Medicine in the newly-constituted university of Halle. He gained a European reputation as a practitioner, and was body physician to Frederick I. of Prussia. His medical theories are now for the most part antiquated, though some of his pharmaceutical preparations, once highly esteemed, are still in use. The most important of his works, *Medicina Rationalis Systematica* (9 vols. 4to), was published in 1718–40. His *Opera Omnia* were printed at Geneva in 1740, in six folio volumes, with three supplementary volumes in 1753–60.

Hofhuf, one of the chief towns of the Arabian district of El-Hasa, situated a short distance inland, over against the islands of Bahrein in the Persian Gulf. It has a fortress, believed to have been built by the Carmathian princes. It has been in the hands of Turkey since 1872. Pop. 25,000.

Hofmann, August Wilhelm, chemist, was born at Giessen, 8th April 1818. After obtaining the degree of doctor of philosophy, he became assistant to Liebig in the laboratory at Giessen. When the Royal College of Chemistry was established in London in 1845 Hofmann was, on Liebig's recommendation, made superintendent of the new institution; and from 1856 to 1865 he was chemist to the royal mint. In 1865 he went to Berlin as professor of Chemistry. His contributions to the scientific journals here and in Germany are mainly on organic chemistry. It was in the course of these researches that from coal-products he obtained aniline (see Aniline, Dyeing). He devoted much time and labour to the development of the theory of chemical types. His *Introduction to Modern Chemistry* (1865; 7th ed. 1877) led to great reforms in the teaching of chemistry. He wrote on *The Life-work of Liebig* (1876), and, in German, on the work of the chemists Wöhler (1883) and Dumas (1885), as also *Chemische Erinnerungen* (1882). Ennobled in 1888, he died 5th May 1892.

Hofmann, Johann Christian Karl, theologian, was born at Nuremberg, 21st December 1810, studied at Erlangen and Berlin, and having been *docent* and extra-ordinary professor of Theology at Erlangen, was called as professor to Rostock, whence, in 1845, he returned to Erlangen. He was ennobled in 1857, and died 20th December 1877. In his numerous works he maintained an unswerving Lutheranism, the chief being the work on prophecy (*Weissagung und Erfüllung*, 1841–44) and the defence of Christianity from its records, *Der Schriftbeweis* (1852–56; 2d ed. 1857–60).

Hog. See Boar (Wild), Pig. In Scotland a sheep that has not yet lost its first fleece is called a Hog or Hogg; a sheep two years old is a Hogget.

Hogarth, William, a celebrated painter, engraver, and pictorial satirist, born in Bartholomew Close, London, on the 10th November 1697, served his apprenticeship to a silversmith named Ellis Gamble, in Cranbourne Alley, Leicester Fields, and studied art at Sir James Thornhill's school in

James Street, Covent Garden. About 1720 he set up for himself. His first employment was to engrave coats of arms, crests, shop bills, &c., after which he began to design plates for the booksellers, the chief of which are the illustrations to Gray's edition of *Hudibras* (1726). He next tried his hand at portrait painting, and soon had ample employment for what are called 'conversation pieces,' but he never cared greatly for this branch of art. In March 1729 he married clandestinely the daughter of Sir James Thornhill, and shortly afterwards began to display his extraordinary faculty for depicting the vices and follies of his time. In 1730–31 he painted 'A Harlot's Progress,' a series of six pictures which, like many of his other works, was engraved by himself. It was published in April 1732. The 'Harlot's Progress' was followed by other moral histories and satiric delineations, such as 'A Midnight Modern Conversation' (1734), 'Southwark Fair' (1735), 'A Rake's Progress' (1735), 'The Distressed Poet' (1736), 'The Four Times of the Day,' and the 'Strolling Actresses dressing in a Barn' (1738). Concurrently with these Hogarth made more than one attempt to compete with the popular history-painters of his day, and with far less success produced the large canvases still in St Bartholomew's Hospital—the 'Pool of Bethesda' and the 'Good Samaritan,' both executed in 1736; and he also produced several portraits. The series of graphic satires was, however, continued by the 'Enraged Musician' (1741) and the famous 'Marriage à la Mode' (his masterpiece), six pictures now in the National Gallery, and engraved by various hands in 1745. 'Industry and Idleness,' twelve plates, followed these in 1747; 'Calais Gate, or O the Roast Beef of Old England!' (1749) came next, and in 1750 the fine plate known familiarly as the 'March to Finchley.' The minor plates of 'Beer Street' and 'Gin Lane' and the set called 'The Progress of Cruelty' belong to 1751. In 1752 he published the *Analysis of Beauty*, a treatise containing many shrewd remarks, but confused and illiterate in its style. It had only a *succès d'estime*. After this he returned to his graver, producing (with the aid of Grignion and others) the four prints of the 'Election Series' (1755–58), the 'Cockpit' (1759), and other pieces. In 1757 he was appointed sergeant-painter to the king. In 1762–63 an unhappy excursion into politics involved him in a miserable quarrel with Wilkes and Churchill, the result of which, on his side, was the well-known portraits of Wilkes, and of Churchill as a bear ('The Bruiser'). By this time his health was failing. He composed a tail-piece to his works, 'Finis, or the Bathos,' March 1764; and in October of the same year died at his house in Leicester Fields. He was buried in Chiswick churchyard, under an epitaph by Garrick. Not far off still stands the little villa which he long occupied as a summer residence.

There are portraits of Hogarth by himself in the National and National Portrait Galleries, and most of his pictures, which now enjoy a much higher repute for technique than formerly, are preserved in public or private collections in Britain. His powers of invention and combination were extraordinary; and as a humorist and social satirist with the pencil he has never been surpassed. There can be no doubt also that he genuinely desired to assist by his work in the reformation of manners.

His prints can be studied in the collections of Boydell (1790), or of Bradbury and Cradock (1820–22). Biographical studies of him have been published by G. A. Sala (1866) and the present writer (1889–92). The best commentaries on his engravings are to be found in John Ireland's *Hogarth Illustrated* (1791–98); Lichtenberg's *Ausführliche Erklärung* (revised edition, 1850–53); Nichols and Stevens' *Genuine Works* (1808–17); and E. G. Stephens' *Catalogue of the Satirical Prints and Drawings in the British Museum*, vols. ii. iv.

Hogg, JAMES, Scottish poet, was born, in a cottage near the parish church of Ettrick, Selkirkshire, in the year 1770. The exact date of his birth is unknown; and rather singularly he himself asserted it to have been the 25th January 1772. It is beyond question, however, that he was baptised on 9th December 1770. He was the second son of Robert Hogg, farmer and shepherd, by Margaret Laidlaw, who was a distant relative of William or 'Willie' Laidlaw, the amanuensis of Sir Walter Scott and author of 'Lucy's Flitting.' Hogg's education was conducted in a very irregular fashion, owing to his being taken from school at intervals to help his father in tending sheep. His schooling according to his own statement—amounted in all to about six months: he learned to read the Bible, but not to write. Meanwhile, however, his mother had filled his imagination by telling him 'tales of kings, giants, knights, fairies, kelpies, brownies, &c.' In the intervals of work he seems to have educated himself, and when he was about sixteen years of age a perusal of *The Gentle Shepherd* and *Life and Adventures of Sir William Wallace* kindled his poetical fancy. Hogg himself says, however, that it was not till 1796 that he attempted to write verses, and 'for several years his compositions consisted wholly of songs and ballads, made up for the lasses to sing in chorus.' In 1800 one of his poems, 'Donald M'Donald,' having for its subject the threatened invasion of Great Britain by the first Napoleon, was published anonymously. The following year, having visited Edinburgh to sell his employer's sheep, he had printed in pamphlet form *Scottish Pastorals, Poems, Songs, &c.* Of this small volume a thousand copies were thrown off, but no impression was made upon the public by it. At this time Hogg contemplated emigration to the island of Harris, and wrote a 'Farewell to Ettrick.' His scheme fell through, but he was fortunate enough to make the acquaintance of Sir Walter Scott—then Mr Scott, sheriff of Selkirkshire. Having written out several ballads from his mother's recitation, he sent them to Scott, who gave them a place in the third volume of his *Border Minstrelsy*, which appeared in 1803. The same year Constable, acting on Scott's advice, published a volume of verse entitled *The Mountain Bard*, and also a treatise of a different kind entitled *Hogg on Sheep*. The two between them brought him £300, which he sunk in a farm that proved a total failure. After several years of vicissitude, in which he tried, without success, to run large stock farms, Hogg repaired to Edinburgh and entered definitely on a literary career. He published in 1810 a second volume of poems, *The Forest Minstrel*, which proved a failure, and started a weekly paper, *The Spy*, which lasted for a few months. Meanwhile he seems to have gone into business as a land-agent, but here again to have met with no success. In 1813, however, he published his greatest work, *The Queen's Wake*, and at once obtained cordial recognition from the critics, Jeffrey declaring in the *Edinburgh Review* that 'no doubt can be entertained that he is a poet in the highest acceptation of the term.' Hogg had made the friendship of Harriet, Duchess of Buccleuch, and in accordance with her death-bed request her husband granted him, on the payment of a nominal rent, one of his farms known indifferently as Mossend, Eltrive Lake, or Altrive. Had he given himself up to this farm and to literature Hogg would probably have been a well-to-do as well as a happy man. But he hampered himself by taking the neighbouring farm of Mount Benger, and was more or less in pecuniary difficulties to the end of his days. He was very happy,

however, in his domestic life. In 1820 he married Margaret Phillips, the daughter of a tenant-farmer in Annandale, whom he had met at the house of her brother in-law, Mr Gray, one of the teachers in the High School of Edinburgh. She proved an admirable wife, although she was some twenty years younger than her husband. Hogg now produced in rapid succession a number of works both in verse and prose. Of the former the chief are *Madoc of the Moor*, *The Pilgrims of the Sun*, *Queen Hynde*, and the *Border Garland*; of the latter *The Brownie of Bodsbeck*, *Winter Evening Tales*, *The Three Perils of Man*, and *The Three Perils of Woman*. It seems doubtful whether he was the sole author, or along with Lockhart the joint-author, of the remarkable *Confessions of a Justified Sinner*, otherwise known as *The Private Memoirs and Confessions of a Fanatic*, published in his name. Hogg was at this time a well-known figure in Edinburgh society; was the intimate friend of Professor Wilson, Sir Walter Scott, and Lockhart, although he had his differences with all three; wrote considerably for *Blackwood's Magazine*, and was the basis of the famous 'Shepherd' of the *Noctes Ambrosianæ*. In the end of 1831 he paid a visit to London to arrange for the publication of a complete edition of his works. He remained for some weeks in the metropolis; was entertained to dinner by the Highland Society of London, and in other ways lionised. He died at Altrive, November 21, 1835.

Hogg once described himself to Scott as 'the king of the Mountain and Fairy School' of poetry, and this definition, egotistic though it is, holds good so far as Scotland is concerned. Of his masterpiece, 'Kilmeny,' a leading critic of to-day, Professor Saintsbury, has said that it is 'such poetry as, to take Hogg's contemporaries only, there is none in Rogers or Crabbe, little, I fear, in Southey, and not much in Moore.' Some of his ballads, such as 'The Witch of Fife,' and a few of his songs, especially 'When the Kye Comes Hame,' belong to the immortal part of Scottish if not of English literature. The late Professor Ferrier's description of Hogg as 'after Burns (*proximus sed longo intervallo*) the greatest poet that had ever sprung from the bosom of the common people' is now the universally accepted verdict of criticism. Hogg's prose is much more unequal than his poetry; a strong though coarsish humour is its most notable characteristic.

The chief authorities on the life of Hogg are his autobiography and *Memorials of James Hogg, the Ettrick Shepherd*, edited by his daughter, Mrs Garden (1885). Professor Wilson prefixed a short Memoir of Hogg to an edition of his works published after his death. Another edition in two large volumes by T. Thomson appeared in 1865. The Memoir of Dr Robert Chambers by Dr William Chambers throws light on Hogg's life in Edinburgh; and see Mrs Oliphant's *William Blackwood and his Sons* (1897). A notable recent criticism of Hogg is Professor Saintsbury's in his *Essays in English Literature* (1890).

Hogmanay, a name applied in Scotland to the last day of the year, the 31st of December, often celebrated with holiday festivities in connection with the New-year's Day. In the Scotland of former days it marked the commencement of a holiday of uproarious joviality, a kind of annual Saturnalia, in which the New Year was ushered in with the most boisterous revelry, accompanied by many quaint and time-honoured ceremonies. The origin of this name is altogether uncertain, and many idle etymologies have been offered. These the curious will find in Chambers's *Book of Days*.

Hog-nut. See Cob-nut.

Hog Plum, a name given in the West Indies to the fruit of certain species of Spondias trees and shrubs of the natural order Anacardiaceæ, also called Spanish Plum and Brazilian Plum. *S. purpurea* and *S. lutea* are the species generally called Hog Plum in the West Indies, because their fruits are a common food of hogs, which revel in their abundance. A much-esteemed Brazilian dish is prepared of milk, curds, sugar, and the pulp of the fruit of *S. tuberosa*, from which also a refreshing beverage is made for use in fevers.

Hog-rat, or Hutia (*Capromys*), a genus of porcupine like rodents (Hystricomorpha) of the family Octodontidæ. The body is from 20 to 22 inches long, covered with long very harsh fur, consisting of a mixture of black and yellow hairs; the tail is stout and rounded and slightly hairy, and is used for support in sitting erect or for aid in climbing trees. They are nocturnal or crepuscular animals; their food is almost entirely vegetable. Three species are known, two inhabiting Cuba, and one Jamaica, where they are found in large numbers in the dense forests on trees or in thick underwood. The negroes use them for food, capturing them by snaring or hunting them with dogs.

Hogshead, an old English measure of capacity, no longer in use, but equivalent for wine to 63 gallons, for ale and beer to 51 gallons. In the United States the word now signifies a large cask.

Hogue, Cape La. See La Hogue.

Hohenlinden, a village of 300 inhabitants in Upper Bavaria, 20 miles E. of Munich, famous for the victory gained there by 70,000 French under Moreau over 60,000 Austrians under the Archduke John, 3d December 1800. Moreau's army took up a position on the plateau between the Isar and the Inn, and the Austrians on the right bank of the Inn. The Austrian main body advanced amidst drifting snow, and attacked the divisions of Grénier and Grouchy with the utmost fury; but, the French receiving considerable reinforcements under Ney, the assailants were driven back, and, being attacked in the rear, were totally routed. The victory was likewise decided at other points in favour of the French, who were only prevented from pursuit by inclement weather, bad roads, and the short winter day. The Austrians and their Bavarian allies lost 17,000 men and 74 guns; the French had 5000 killed and wounded. Campbell's immortal lyric will keep the details of this battle from ever being forgotten. See Schleifer, *Die Schlacht bei Hohenlinden* (1885).

Hohenlohe, a former German principality in Franconia, now comprised chiefly in Würtemberg, partly also in Bavaria.

Hohenschwangau, a royal castle in Bavaria, 55 miles SW. of Munich, near the right bank of the Lech, and the southern frontier of the kingdom. It stands in a beautiful and romantic district, 2933 feet above sea-level. It was purchased in 1832 by the crown-prince Maximilian of Bavaria, who restored it in the style of a magnificent medieval feudal castle. The interior contains several superb halls decorated with frescoes and wall-paintings by eminent German artists. A castle called Schwanstein occupied the same site as early as the 12th century; a second was erected in 1538–47; and the existing building is the third castle. On another crag over against Hohenschwangau stands the castle of Neuschwanstein, which was built in 1869–71 on the site of the castle originally called Hohenschwangau by King Louis of Bavaria, in the Early Romanesque style. This castle too, a most magnificent and 'romantic' structure, contains superb wall-paintings, and displays the utmost splendour in its internal fittings. It was for some time the favourite residence of the recluse king, Louis II. See Zwickh, *Herrenchiemsee und Neuschwanstein* (1886).

Hohenstaufen, a German princely house, members of which held the imperial throne from 1138 to 1254. The founder of the family was FREDERICK VON BUREN, who lived about the middle of the 11th century. His son Frederick assumed the name of Hohenstaufen from a castle which he built on the hill of Staufen (2240 feet), 25 miles E. of Stuttgart. He was invested with the duchy of Swabia by the Emperor Henry IV., and during the absence of the latter in Italy acted as vicegerent of the empire. Frederick, at his death in 1105, left two sons, Frederick II. the One-eyed, and Conrad. The former was confirmed in the duchy of Swabia; and in 1112 the latter received the duchy of Franconia. After the death of Henry V. this emperor's family estates fell to the House of Hohenstaufen; and Lothaire of Saxony was elected his successor in the empire. Lothaire revoked the grants made to the Hohenstaufens, and thus gave rise to a furious war, in which Frederick (his brother Conrad being absent in the Holy Land) had to encounter, single-handed, the whole power of the emperor, the House of Zähringen, and Henry the Proud, Duke of Bavaria and Saxony. After Conrad's return fortune at first seemed to favour the brothers, but in 1135 they were compelled to submit and plead for the emperor's forgiveness. They were then put in possession of all their estates. Conrad, in 1138, was elected emperor of Germany as Conrad III. The succeeding emperors of this family were Frederick I. (1152-90), Henry VI. (1190-97), Philip I. (1198-1208), Frederick II. (1212-50), and Conrad IV. (1250-54). Manfred, half brother of the last named, lost his life in the battle of Benevento (1266), whilst asserting his rights to the throne of the Two Sicilies; and Conradin, son of Conrad IV., was put to death (1268) by Charles of Anjou for carrying on the struggle. See Raumer, *Geschichte der Hohenstaufen* (5th ed. 1878); GERMANY; and the articles on the several emperors.

Hohenstein, a Saxon town, with textile industries, 12 miles NE. of Zwickau. Pop. 6827.

Hohenzollern, two united principalities (Hechingen and Sigmaringen) of south Germany, but belonging to Prussia, consist of a narrow strip of land entirely surrounded by Würtemberg and Baden. Area, 441 sq. m.; pop. (1890) 66,085, mostly Roman Catholics. The territory, whose surface is generally mountainous, stretches south-east from the Black Forest, across the Neckar and the Danube. The principal industries are agriculture and the rearing of cattle. Iron ore, gypsum, salt, and coal exist, as well as some mineral springs. The seat of government is Sigmaringen (4146).

The Hohenzollern family traces its descent from Count Thassilo, who lived about the beginning of the 9th century, and founded a castle near Hechingen, on the Zollern hill in the Swabian Alb, whence his descendants derived their patronymic. About 1165 the first separation took place, Frederick IV. founding the elder or Swabian and Conrad III. the younger or Franconian line. The elder line was subdivided, in 1576, into the branches of Hechingen and Sigmaringen. Frederick VI., the representative of the younger line, in 1415 received from the Emperor Sigismund the investiture of the electorate of Brandenburg, thus founding the reigning dynasty of Prussia. The two branches of the elder line continued unbroken till 1849, when the reigning princes ceded their respective rights and principalities to the king of Prussia, who agreed to pay them annual pensions. See GERMANY, Vol. V. p. 184.

Hoist. See LIFTS.

Hokitika, the capital of Westland, New Zealand, and the chief town on the west coast, is the chief centre of a gold-producing and agricultural district. Pop. 2178.

Hokusai. See JAPAN.

Holacanthus, a genus of fishes, in characters and distribution similar to the Chætodons (q.v.). They are remarkable for the great beauty and symmetry of their colours, and for their excellence as articles of food. The body is compressed, and the gill-cover bears a strong spine. One of the best known of the forty species, called *Emperor of Japan* by the Dutch, is *H. imperator*, one of the most esteemed fishes of the East Indies, rivalling the salmon in flavour. Its greatest size is about 15 inches long; its colour is deep blue, with numerous narrow bands of orange, the pectoral fins black, the tail bright yellow. In beauty it is rivalled by an allied species, *H. diacanthus*, of similar distribution.

Holbach, PAUL HEINRICH DIETRICH, BARON D', philosopher, and one of the French encyclopædists of the 18th century, was born of wealthy parentage, at Heidelsheim, in the Palatinate, in 1723. At an early age he went to Paris, where he continued to reside during the remainder of his life. He died 21st June 1789. As Holbach was remarkable for his agreeable social qualities, and kept a good table, the most eminent thinkers and writers of the day, such as Condorcet, Diderot, Duclos, Helvétius, Raynal, Rousseau, Buffon, &c., were in the habit of assembling at his house. The witty Abbé Galiani called Holbach the *maître d'hôtel* of philosophy. Here speculation, it is said, was carried to such daring lengths that Buffon, D'Alembert, and Rousseau were compelled to withdraw from the circle. Holbach was the zealous champion of naturalism, and contended not only against Christianity, but against every positive religion. His principal work is the *Système de la Nature* (2 vols. 1770). In it the author endeavours to expound the natural principles of morality, and to investigate the origin of the conflicting opinions on virtue and vice. He discusses the maxims of religious morality, and takes a rapid survey of social and savage life. He touches on the so-called 'social compact,' and in the course of his observations tries to prove, among other things, that self-interest is the ruling motive of man, and that God is only an ideal being, created by kings and priests. The materialism of the French *philosophes* of the 18th century is nowhere more pernicious and paltry than in the writings of Holbach. It is but fair to state that his life was better than his books. He was a man of good heart, and, in spite of his theories, of most unselfish benevolence. When the Jesuits fell into disgrace during the reign of Louis XV., Holbach, though he hated their system, and had written against them in the days of their prosperity, made his house an asylum for his old foes when the clouds gathered round them. See an article by J. Morley in the *Fortnightly*, 1877.

Holbeach, a market-town of south Lincolnshire, 7½ miles by rail ENE. of Spalding. It has a fine Decorated church, with a spire 189 feet high; and Roman remains have been found here. Pop. of parish (1851) 5191; (1881) 5190.

Holbein, HANS, the younger, one of the most celebrated of painters, was born at Augsburg in 1494 or (more likely) 1495, the son of Hans Holbein the elder (*c.* 1460-1524), also a painter, and known by such works as 'The Basilica of St Paul,' now in the Augsburg Gallery. He was instructed in art by his father, and his earlier efforts were influenced by the works of Hans Burgkmair, who, according to such authorities as Stetten, was

his maternal uncle. The first paintings that can with certainty be attributed to Holbein's hand are two panels of an altarpiece in the above named collection. Various Madonna pictures which bear traces of the influence of the school of Memling, and a votive work in memory of Burgomaster Ulrich Schwartz, were painted in the immediately following years; but the finest of the artist's productions executed in Augsburg was the altarpiece for the monastery of St Catharine (1515–16), now in the Pinakothek, Munich, Renaissance architectural ornamentation of great beauty being skilfully introduced.

About 1516 Holbein was at work in Basel, but he does not appear to have settled there till 1520, when he received the freedom of the city, and became a member of the guild *Zum Himmel*, which his elder brother Ambrosius, also a painter, had joined three years previously. During the interval he was painting in Zurich, and in Lucerne —where he decorated the interior and exterior of the residence of the mayor, Jacob von Hertenstein, with paintings now only known through drawings which were executed before the building was destroyed in 1824. It is possible that he also during this period made a brief visit to Milan; and the influence of the masters of northern Italy, especially of Mantegna and Leonardo da Vinci, can be traced in his subsequent productions. Among the more important works executed at Basel are the powerful portraits of the Burgomaster Jacob Meier and his wife; while the religious subjects of the period include eight scenes of the Passion, painted upon a panel, ranked very highly by Woltmann, though Rumohr and Wornum are unable to regard them as Holbein's work, and the doors of the organ of Basel Cathedral, painted, upon canvas, with stately figures of saints and bishops. All these works are now in the Basel Museum. To 1522 is due one of the most important of the master's religious pictures, the Madonna and Child with St Ursus and St Martin of Tours (or perhaps St Nicholas), painted for the church of Reuchen, near Solothurn; and to about the same date is assigned the great work commissioned by that Jacob Meier whom Holbein had already painted, and representing the merchant with his wife and family kneeling before the Virgin and Child. The picture exists in two slightly-varying versions at Darmstadt and at Dresden, of which the former is the finer, and is now generally admitted to be the original. His mural decorations of 'The Peasants' Dance' and various classical subjects on the façades of a house in the Eisengasse, and those in the town-hall, are now known only through sketches and a few surviving fragments. He also executed noble portraits of Bonifacius Amerbach, professor at Basel, in the museum there; of Frobenius, the printer; and two distinct portraits of Erasmus and one of Melanchthon. Another interesting memorial of the intercourse between Erasmus and Holbein is a copy of the 'Praise of Folly,' published by Frobenius in 1514, in which the margins are enriched by a series of vigorous and humorous pen-sketches by Holbein. It is now in the Basel Museum.

During his residence at Basel Holbein was largely employed upon designs for the wood-engravers, probably indeed it was mainly with a view to such work that he settled there. In addition to about twenty alphabets of richly ornamental letters, he designed over 300 woodcuts, including printers' devices, title-borders, and such general illustrations as those to Adam Petri's editions of Luther's New Testament (1522 and 1523), to Thomas Wolff's issue of the same work (1523), and to Petri's edition of Luther's Old Testament (1523); as also the large single woodcuts of 'Christ bearing the Cross' and 'The Resurrection,' and the two scarce subjects of 'The Sale of Indulgences' and 'The True Light,' which, like some other of his works, show the artist's warm sympathy with the Reformation. His most important woodcuts, however—the noble series of 'The Dance of Death' and the 'Old Testament Cuts'—though probably executed at this time, were not issued till a later period, the first editions of both being published at Lyons in 1538. It was formerly believed that Holbein was engraver as well as designer of the woodcuts associated with his name, but it is now generally conceded that he only designed and drew them.

In the end of 1526 or the beginning of 1527 Holbein visited England, when he was introduced by Erasmus to Sir Thomas More, then in high favour with Henry VIII. He now began his great series of portraits of the most eminent Englishmen of his time, the studies for many of which exist in the cabinet of eighty-seven masterly drawings by his hand in the royal collection at Windsor. In various ways these drawings throw valuable light upon his methods of work; the fact, for instance, that many of them bear written notes of the colours of their details proves that he was accustomed to execute his finished oil portraits from such charcoal and chalk sketches as these, and not directly from the life. Excellent autotype reproductions of these drawings have been issued by the South Kensington Department. Among the most notable of his oil portraits executed in England are 'Archbishop Warham,' of which versions exist at Lambeth Palace, in the Louvre, and in the possession of Viscount Dillon; 'Sir Henry Guildford,' in the royal collection at Windsor; 'Nicholas Kratzer,' the king's astronomer, in the Louvre; and 'The Family of Sir Thomas More,' now lost, but known through various copies and through the original sketch, now in the Basel Museum.

On his return to Basel (1529) Holbein painted the group of his wife and two children now in the museum there; and in the following year again took up his work in the council-hall, executing powerful mural subjects of 'Rehoboam,' 'Samuel and Saul,' and 'Hezekiah,' works now destroyed. Probably in the beginning of 1532 he again visited London, whence a pressing invitation from the Basel council was ineffectual to withdraw him. At first he was much employed in London by the German merchants of the Hanseatic League, many of whose portraits he executed. Sketches still remain for the decorations which he designed for these traders of the steelyard on the occasion of the marriage of the king to Anne Boleyn; which, with 'The Triumphs of Riches and of Poverty,' were almost the only symbolical subjects executed at this period, to which are also due the great portrait group at Longford Castle known as 'The Ambassadors,' probably representing Sir Thomas Wyatt and John Leyland, the portraits of Thomas Cromwell, and the exquisite circular miniatures of Henry and Charles Brandon, sons of the Duke of Suffolk, in the royal collection at Windsor. He also executed many masterly designs for metal-work, and such drawings for the wood-engravers as the title-pages of Coverdale's translation of the Bible (1535) and of Hall's Chronicles (1548). From a letter from the poet Bourdon to Solimar, dated 1536, we learn that Holbein at that time held the appointment of royal painter to Henry VIII.; and in this capacity he executed at Whitehall Palace a mural painting of the monarch and Queen Jane Seymour, with Henry VII. and Elizabeth of York, destroyed in the fire of 1698, of which a copy by Van Leemput exists at Hampton Court, while a portion of the original cartoon is at Hardwick Hall. This latter work and the large-sized miniature in the possession

of Earl Spencer are regarded by Woltmann as the only surviving authentic portraits of the king from Holbein's hand among the many bearing his name. His delicate and exquisite portrait of Queen Jane Seymour is in the Belvedere, Vienna. To the same period is to be assigned the admirable half length of Sir Nicholas Carew, Master of the King's Horse, at Dalkeith Palace, and the noble portrait of Hubert Morett, the jeweller, formerly attributed to Leonardo, in the Dresden Gallery.

Holbein was repeatedly employed abroad on the king's service. In 1538 he was despatched to the court of the Netherlands to paint a likeness of Christina of Denmark, who had been proposed as a successor to Jane Seymour as queen to Henry VIII. In a three-hours' sitting he executed a sketch 'very perfight;' and from this he produced the noble full-length in the possession of the Duke of Norfolk. This work is one of the painter's choicest masterpieces, most attractive in the quietude of its execution and in its rendering of feminine sweetness and innocence. In the same year he appears to have been in Burgundy upon the king's business; and in July 1539 he was despatched to the court of Cleves, where he painted Anne of Cleves—'expressed her imaige verye lyvelye'—in a work now in the Louvre; while about 1540 he executed the striking portrait of the Duke of Norfolk, uncle of Queen Catharine Howard, of which the original is at Windsor, and an old copy is preserved at Arundel Castle. The last work upon which Holbein was engaged was the picture of 'Henry VIII. granting a Charter to the Masters of the Barber-Surgeons Company,' still preserved in their guildhall. It was left incomplete at the time of his death by the plague, which, as the discovery of his will by Mr Black in 1861 has proved, occurred in London between 7th October and 29th November 1543, eleven years earlier than was previously believed.

Holbein is seen at his highest in his portraiture; and in this department his expressional power, his veracity and dignity, and his noble technical qualities of unerring draughtmanship, subtle and perfect modelling, and richness and force of colouring entitle him to rank with the greatest masters. It is his power as a portraitist that gives value and impressiveness to his religious subjects. He has little of the imaginative force, the visionary power, which stamps the works of an artist like Dürer; but his foot treads very firmly upon the earth, and the faces and forms which he bestows upon his sacred personages are full of homely truth, and a simple, moving pathos. As an ornamentalist he ranks as the equal of the greatest Italian masters, his work of this class being distinguished by easy seizure of form, great nobility of design, and the most exuberant richness of fancy.

Many works by Holbein were included in the South Kensington Portrait Exhibition of 1866, in the Royal Academy Old Masters' Exhibition of 1880, and in the Tudor Exhibition of 1890; but in all of these exhibitions many portraits were quite erroneously attributed to his brush.

See *Hans Holbein und seine Zeit*, das Kunstlers Familie, Leben und Schaffen, by Alfred Woltmann (2d ed. Leip. 1874–76; English trans. of the first edition, by F. E. Bennett, Lond. 1872); and *Some Account of the Life and Works of Hans Holbein*, by R. N. Wornum (Lond. 1867).

Holberg, Ludwig, Baron Holberg, the creator of modern Danish literature, was born at Bergen in Norway, 3d December 1684. He took his degree at Copenhagen, and spent some fourteen years partly as private tutor and partly in travel, in the course of which he visited England (where he studied two years at Oxford), France, Italy, and Germany. In 1718 he was appointed professor of Metaphysics at Copenhagen, but in 1720 exchanged that chair for the more lucrative one of Eloquence. The works that laid the foundation of his fame were satirical poems—first and foremost the serio-comic epic, written in iambics, of *Peder Paars* (1719–20), in which he ridicules the pedantic stiffness and stupidity of contemporary life and thought, and after this *Hans Mikkelsen's Jesting Poems* (1722) and *Hans Mikkelsen's Metamorphoses* (1726). But in 1721 the first Danish theatre was opened at Copenhagen, and Holberg tried his hand at comedy-writing, with, as it turned out, marvellous success. His excellent light comedies, on account of their genuine wit, comic humour, and skilful character-drawing, are counted by the Danes amongst the best things in all their literature. They were published by their author in a collected form in 1723–25, and again, with five new plays added, in 1731–54. In 1730 Holberg became professor of History, and seven years later quæstor of the university; and in 1747 he was ennobled. He died at Copenhagen on 28th January 1754. Perhaps the most noticeable feature in Holberg's character is the versatility of his genius. After 1724 he again turned his pen to history, and wrote, amongst other books, a *History of Denmark*, a *General Church History*, a *History of the Jews*, and *Comparative Biographies of Great Men and Women*, all greatly esteemed, particularly the first. Then in 1741 he produced another classic of Danish literature, the satirico-humoristic romance *Niels Klim's Subterranean Journey*; and lastly he wrote serious reflective works, *Moral Thoughts* (1744) and *Epistles* (1748–54). His *Autobiography* (1727–43) should also be mentioned. *Peder Paars*, the *Subterranean Journey*, and the *Autobiography* have been translated into English.

The best critical edition of his *Comedies* is that published by the Holberg Society in 8 vols. 1848–53 (new ed. 1884). See the monographs by Rahbek (1815–17), Werlauff (1838), Pontz (1857), and G. Brandes (*Holberg and seine Zeitgenossen*, Berlin, 1885).

Holcroft, Thomas, playwright and novelist, was born in London, 10th December 1745 (o.s.). His father, in whom fondness alternated with fury, was by turns a shoemaker, horse-dealer, and pedlar; and he himself, after three years as a Newmarket stable-boy, then eight as shoemaker, schoolmaster, and servant-secretary to Granville Sharpe, in 1770 turned strolling player. He never was much of an actor, best in low comedy and old men's parts; and, after settling in London (1777), he gradually took to authorship. *Alwyn, or the Gentleman Comedian* (1780), was the first of four novels; *Duplicity* (1781), of upwards of thirty plays. Of the latter, *The Follies of a Day* (1784), adapted from Beaumarchais' *Mariage de Figaro*, brought him more than £600; and *The Road to Ruin* (1792), £1300. Between these befell the great sorrow of his life, the death of his eldest son, William (1773–89), who having robbed his father of £40, and been found by him on an American-bound vessel, shot himself: for a twelvemonth the stern, strong man hardly quitted the house. An ardent if peaceable democrat, in 1794 he was tried for high-treason with Hardy, Horne Tooke, and nine others. The proceedings fell through, but the animosity of party spirit entailed a run of ill-luck at the theatres, which, combined with unfortunate speculations, led Holcroft to sell off his books and effects (1799), and to retire for four years to Hamburg and Paris. He died 23d March 1809. See the interesting *Memoirs*, written by himself, and continued by Hazlitt (1815); also Kegan Paul's *William Godwin* (1876).

Holden, Sir Isaac, one of the inventors of lucifer matches and of important modifications in wool-carding machinery, was born 7th May 1807, at

Hurlet, Renfrewshire, his father having been a Cumberland farmer and lead-miner. While a worker in a cotton-mill in Paisley, he fitted himself for the post of an assistant teacher, first at Leeds, then at Huddersfield, and latterly at Reading. Finding flint and steel inconvenient when he got up at 4 A.M. to pursue his studies, he hit on the idea of putting sulphur under explosive material, which solved the problem of the lucifer match. The principle he expounded to his pupils at Reading in 1829, and through them it seems to have become known in London. Holden was not himself aware that lucifer matches had been made nearly two years before by John Walker, a chemist of Stockton-on-Tees, who sold them in April 1827 at one shilling and twopence a box. While book keeper in a worsted-mill at Bingley, Yorkshire (1830–46), Holden became possessed with the ambition of inventing wool-combing machinery. In 1846 he joined with Mr Lister, who had done much to improve the system of wool-combing, in starting a mill at St Denis, near Paris. The rude wool-combing by steel teeth was done away with by Holden's square motion machine in 1850. Lister retired, and the firm became Isaac Holden & Sons in 1859, and the Alston works near Bradford were founded. After the expenditure of about £50,000 in experiments, Holden's wool-combing machinery brought him both fame and fortune. Holden was member for Knaresborough 1865–68, for the North-west Riding 1882–85, and for the Keighley division of Yorkshire from 1885. He was made a baronet in 1893, and preserved his vigorous health till shortly before his death on 13th August 1897.

Holderness, the name of a parliamentary division (including Beverley) and of a wapentake in the East Riding of Yorkshire. Pop. of the former, 41,298; of the latter, 25,000.

Holding, the term in Scots law used to denote the manner in which heritable estate is holden, and corresponding to Tenure (q.v.) in English law. See also FEU, and AGRICULTURAL HOLDINGS ACT.

Holibut. See HALIBUT.

Holiday, in Law, means Sunday, Christmas-day, Good Friday, and any other day appointed for a public festival or fast. In Catholic times holidays were numerous; but modern legislation and custom have considerably reduced their number. Of late years the importance of holidays to working people has been recognised, and acts have been passed increasing the number of bank holidays. When a bill of exchange falls due on a Sunday, payment must be made the day previous. If it falls due on any of the bank holidays, the bill is payable the day after. In England the courts excuse a man for not giving notice of dishonour of bills of exchange not only on Sunday, Good Friday, and Christmas-day, but also even on the festival days of his own religion; and, though there has been no decision in Scotland on the subject, the same rule would no doubt be applied to fast-days prescribed by different sects, and a notice sent on the day following would suffice. But as a general rule, and in all other respects, it may be laid down that no sect, established or unestablished, nor any court or public body, has any power whatever to declare a holiday which has any legal effect, or which can bind the public or the rights of third parties. Nothing but an act of parliament has that effect, and not even a proclamation of the crown would be sufficient. Hence it is that when a solemn national fast is proclaimed, which is to be put on the same footing as a Sunday, it requires a special act of parliament to make it binding on the public in matters of business. See BANK HOLIDAYS; and for ecclesiastical and popular holidays, see FESTIVALS.

Holinshed, RAPHAEL, an English chronicler, belonged to a good Cheshire family, and, according to Wood, was educated at one of the universities, and became a minister of God's word. He appears also to have been steward to Thomas Burdet of Bromcote, in Warwickshire, and died between 1580 and 1584. The work with which his name is connected is *The Chronicles of England, Scotland, and Ireland*, published in two folio volumes in 1577. This edition, together with its predecessor, the Chronicle of Hall, was the direct source from which Shakespeare drew the materials for his English historical plays. If we except the history of *King John*, which stands by itself, these form a regular historical sequence of English kings from Richard II. to Henry VIII., the reign of Henry VII. alone omitted as unsuitable for dramatic representation. And it is not a little interesting and significant that these cover exactly the same period as Hall's Chronicle—a period full of great action and tragical catastrophes profoundly touched with pathos.

The first edition of Holinshed contained many woodcuts which were omitted in the second edition (3 vols. folio; usually bound in two, 1586–87), as well as a number of passages cancelled by order of the Privy-council as disagreeable to Queen Elizabeth. These castrations were published separately in black letter like the original, by Dr Drake in 1723, and are inserted in their proper places in the splendid edition of the *Chronicle* published in six 4to volumes (1807–8). This last edition has the particular merit of an exceptionally full index.

Holinshed was by no means the only writer of the work which bears his name, and, indeed, its whole history is not a little interesting. Early in the reign of Elizabeth the queen's printer, Reginald Wolfe, a German by birth, planned 'a Universal Cosmographie of the whole world, and therewith also certain particular histories of every known nation,' and for the historical part of the work had engaged Raphael Holinshed among other men. When the gigantic work was nearly completed Wolfe died, after twenty-five years' labour at his scheme. Those who were to bear the cost of printing the whole now took fright at the expense, and resolved to do only so much of it in the meantime as related to England, Scotland, and Ireland. Holinshed having the history of these countries in hand, application was made to Harrison to furnish the descriptions of Britain and England to be prefixed to the whole. Of the three volumes in the second edition, the first is made up of these and Holinshed's own history of England till the Conquest. The second contains the Description of Ireland by Richard Stanihurst, the translator of Virgil's *Æneid* into English hexameters, himself a Catholic and the uncle of Archbishop Ussher; then the history of Ireland to its Conquest, adapted from Giraldus Cambrensis, by John Hooker or Vowell, uncle of the Judicious Hooker; next the history of Ireland to the year 1509 by Holinshed; its continuation to 1547 by Stanihurst; and thence to 1586 by Hooker. The second volume contains further the Description of Scotland by Harrison; the history of Scotland by Holinshed, down to 1571, and by Francis Boteville, or Thin, the Lancaster herald, with the help of others, from 1571 to 1586. This was mainly compiled from Bellenden's translation of Boece, John Major, and the continuation of Boece by John Ferreri. The third volume is made up of the history of England from William the Conqueror down to 1577 by Holinshed, and from 1577 down to 1586 by the famous antiquary Stow, Fr. Thin, Abraham Fleming, and others. In the modern six-volume edition of 1807–8 these are more conveniently arranged; the first four volumes

being devoted to the history of England, the fifth to Scotland, the sixth to Ireland, each having the Description of its proper country prefixed.

Holinshed was an honest and industrious man, and had the advantage of being able to consult the manuscripts of Leland. In the 'Preface to the Reader,' at the beginning of the third volume of the second edition, he says: 'My speech is plain, without any rhetorical show of eloquence, having rather a regard to simple truth than to decking words.' And in his conclusion to the reign of Elizabeth, Abraham Fleming, the contributor of many valuable notes throughout the entire work, describes with modest truthfulness those who had labored together as 'men of commendable diligence, though not of deepest judgment.

Holkar, the name of a powerful Mahratta family, the members of which have at various times been formidable enemies to the British empire in India. The founder of the family was Mulhar Rao Holkar, who was born in the Deccan, 1693, and, having gained by his valour the favour of the Peishwah, obtained from him the western half of Malwa, with Indore for his capital. See INDORE, MAHRATTAS.

Holl, FRANK, R.A., portrait and subject painter, was born in Kentish Town, 4th July 1845, a son of Francis Holl, A.R.A. (1815–84), the well-known engraver. He was educated at University College School, London, and in 1860 entered the schools of the Royal Academy, where he won gold and silver medals, in 1863 a two years' scholarship for the best historical painting by his 'Abraham about to sacrifice Isaac,' and in 1868 the travelling studentship of the Academy by his subject-picture of 'The Lord gave, and the Lord hath taken away.' Four years previously he had begun to exhibit in the Royal Academy with a portrait of himself and a subject picture, 'Turned out of Church.' These were followed by various effective *genre*-subjects dealing almost invariably with pathetic scenes from modern life, such as 'I am the Resurrection and the Life' (1872), 'Want—the Pawnbroker's Shop' (1873), 'Her First-born' (1876), 'Newgate—Committed for Trial' (1878), 'Ordered to the Front' (1880), 'Returned from the Wars' (1881), 'Deserted' (1884). He was elected A.R.A. in 1878, and R.A. in 1884. About 1877 he turned his attention to portraiture, and speedily attained immense popularity in this department, his works being marked by a powerful if rather heavy touch, an effective chiaroscuro, and by much dignity of style, though they possess little sweetness of colour, and are somewhat marred by the recurrence of opaque blackness in the shadows. Among the most important of his portraits may be named 'Sir Henry Rawlinson' (1881), 'Duke of Cambridge' (1883), 'Prince of Wales' (1884), 'Duke of Cleveland' (1886), 'Sir G. O. Trevelyan' (1887), and 'W. E. Gladstone,' 'Sir William Jenner,' and 'Lord Spencer' (1888). His health suffered from his incessant artistic production, and he died 31st July 1888. A collection of over fifty of his works was brought together in the winter exhibition of the Royal Academy, 1889.

Holland, the popular and generally-accepted name of a country which is officially described as 'Netherland,' or 'The Netherlands,' applies to a maritime kingdom lying between 50° 43′ and 53° 36′ N. lat., and 3° 22′ and 7° 16′ E. long. It is bounded on the N. by the North Sea, E. by Prussia, S. by Belgium, W. by the North Sea. Its greatest length from north to south is 195 miles, and its greatest breadth from west to east 110 miles. It contains 12,630 sq. m.—little more than one-tenth of the size of Great Britain and Ireland. Luxemburg was long included, but this grand-duchy had a distinct government as a separate state, and Holland only possessed a dynastic interest in it, which passed away with the death of William III. in 1890 (see LUXEMBURG). The following table gives the population of Holland in 1888, the area of the provinces, and the provincial capitals:

North Brabant	1850	510,249	Bois-le-Duc
[illegible]	1840	[illegible]	Arnhem
South Holland	1840	[illegible]	The Hague
North Holland	1840	[illegible]	Haarlem
Zealand	690	[illegible]	Middelburg
Utrecht	510	[illegible]	Utrecht
[illegible]	510	[illegible]	Leeuwarden
Overyssel	1840	[illegible]	Zwolle
Gelderland	1840	[illegible]	Arnhem
Drenthe	1040	120,108	Assen
Limburg	850	280,161	Maastricht
	12,630	4,511,415	

At that date the population of Luxemburg (213,000) was also under the king of the Netherlands. At the census of 1889 the total population of the Netherlands was 4,511,415; in 1895 it was 4,795,646.

Thus, in spite of increased emigration to America North and South, and Africa, the population shows 379 inhabitants to the square mile. Holland is the most densely peopled country of Europe, after Saxony (605 inhabitants to sq. m.) and Belgium (558). The population is thinnest in the eastern provinces, and densest in North and South Holland, where it averages about 850 per square mile. About three-fifths of the population are Protestants, and two-fifths Roman Catholics, besides 100,000 Jews.

In 1895 there were eight towns with more than 40,000 inhabitants—viz. Amsterdam, the capital, 450,000; Rotterdam, 235,000; The Hague, residence of the royal family and seat of the government, 180,000; Utrecht, 93,000; Groningen, 60,000; Haarlem, 58,000; Arnhem, 53,000; and Leyden, 45,000.

Physical Aspect.—Voltaire's words, '*Canards, canaux*,' aptly describe the leading features of the country—flat, full of water and waterways, swarming with aquatic birds. Like Egypt, Holland, in its greater part, is a delta formed by the alluvium deposited by the great rivers that flow through it into the North Sea. But Holland is not only flat: it is also hollow, and this explains its name—Hollowland. In a large measure the soil lies under the level of the water, salt or otherwise. Along the canals the meadows are 10 or 12 feet, sometimes more, beneath the water-line; by the sea, at high tide, there may be a difference in the level of the soil and of the ocean of quite 25 feet or more. Of course all these lands have to be protected by embankments or dykes, the tops thereof, broad and flat, being used for carriage-roads and foot-paths. The constant battle of the Hollanders against the watery element finds expression in the motto of the province of Zealand: *Luctor et emergo!* They utilised the mighty rivers, the Rhine, Waal, and Maas, that traverse and fertilised their country, at an early date; and they have covered the land with a network of canals that is probably unique in the whole world. Apart from forming convenient boundaries, these canals serve a twofold purpose: they are mostly navigable for small craft, and they help to irrigate the land. Large windmills are posted at the main points to pump out the superfluous water; hence they form a conspicuous feature of Dutch landscapes. Other windmills near the towns and villages frequently work for different purposes, but they are one and all remarkable for their peculiar shape and the enormous size of their sails, one single sail reaching often to 120 feet. The canals also provide, when frozen, an important medium of communication to skaters.

Some of them date back for centuries; the most ancient is certainly the *fossa Drusi* in the east, made in the time of Augustus, and referred to by Tacitus. Many canals, regulated by locks (which were probably known in Holland a hundred years before they were introduced into Italy in the 15th century), connect the parallel rivers, and the Yssel forms a link between the Rhine and the canals and meres of Friesland. The latter are vast and somewhat shallow lakes. Thus it is possible to travel on water through the whole of Holland. The principal canals are the North Holland Canal, from Amsterdam to Den Helder, 51 miles long; the William's Canal, through North Brabant and Limburg, which has a length of 71½ miles; the North Sea Canal, from Amsterdam to Ymuiden, on the German Ocean; and the canal from the Maas, near Rotterdam, to the so-called Hoek van Holland, named the New Waterway, which now enables ocean-steamers to reach Rotterdam at all times. We have already described the most important (see CANAL), and we will only add here that in 1890 it was proposed to do away with the locks on the North Sea Canal, making it a level navigable channel for ocean-steamers from end to end. The cutting and maintaining of canals in Holland is one of the chief functions of the Waterstaat, a public department that is carried on under an independent minister of the crown, and is entirely confined to hydraulic engineering. The reclamation of land by the drainage of lakes, and by pushing back the sea and creating what are styled 'polders,' is likewise a leading feature in the operations of the Waterstaat. These newly-reclaimed polderlands always fetch high prices amongst the agricultural classes, as was the case with the Haarlem Lake (q.v.) polder, which was sold in plots at such prices that the state made an excellent bargain. The draining of Haarlem Lake will be eclipsed, should the scheme of laying dry the Zuider Zee (q.v.), which involves an estimated outlay of £26,000,000, be carried out. This would enrich Holland with a new province of about one and a half million acres.

The maintenance of dykes by the Waterstaat forms another task of vital moment; the safety of the state depends upon their constant strength and resisting power where there are no hills or dunes to offer a natural protection against the encroachments of water. It is a mistake to suppose that the ocean is Holland's most treacherous and formidable foe; the rivers, when swollen by heavy rains or falls of snow, are much more dangerous. As the river beds naturally rise by alluvial deposits, the embankments have to be made higher and higher. In times of peril a special dyke service is organised, and headquarters are kept informed night and day by a body of Waterstaat engineers, who direct their trained workmen to the points that are more immediately threatened. Dykes form a very expensive item in the budgets of Holland. Half a million pounds will not cover the annual cost to the state. Besides, many dykes are almost entirely maintained out of local rates. The most formidable and costly sea-dykes are round the western coast-line of Walcheren Island, and near Den Helder in North Holland. These dykes are veritable ramparts, formed by piles at the base, which support a superstructure of earth and stones. The annual cost of keeping one in repair frequently reaches £8000 to £10,000. Despite the care and precautions of ever vigilant and ingenious men, disasters through inundations form but too familiar a feature in the history of Holland. A series of irruptions of the ocean created the Zuider Zee between 1170 and 1395. As Goldsmith says in his *Traveller*, the Dutchman has 'scooped out an empire' from the ocean, and the old Dutch proverb that God made the sea but the Hollander the land holds true to this very day.

Communications.—The oldest railway of Holland is the line connecting Amsterdam and Rotterdam by way of Leyden, which was commenced in 1837. The principle of state railways was settled in 1860, and extended in 1873 and 1875. The whole country is now covered by a network of railways built out of state funds, and in 1890 there were 1630 miles open for traffic. They are not worked by the government, but by a company, which pays the treasury a certain proportion of the net profits. There are several private railways, but the present tendency is to make them state properties. The country roads, mostly paved with bricks, are broad and excellent, but tolls are still maintained. The old-fashioned way of navigating the canals in *trekschuiten*, or boats drawn by horses, or men and even women, along a towing-path, is tending to disappear. The number of passengers carried by state and private railway lines in 1894 was over 24,300,000. During the year 1894, 130,000,000 letters and 4,385,000 telegrams were forwarded. Postal savings-banks were instituted in 1881; in 1895 the deposits amounted to 32,250,000 guilders.

Climate, Agriculture, Produce, &c.—The climate of Holland is much like the climate of England, especially in its frequent and rapid changes; but, as a rule, the Dutch summer is hotter and the Dutch winter colder. Ague is prevalent in the low-lying regions of the west, and foreigners are particularly liable to suffer from its ravages.

Agriculture in its various branches forms one of the leading pursuits of the Dutch. In 1896 there were 25,555 farm-owners and farm-tenants. Land tenure is similar to that in France, and fee-simple with peasant-proprietorship the rule. Cattle-rearing and dairy-farming have been the Dutch farmer's chief occupations from time immemorial. This explains why arable land in Holland only covers an area of 2,150,000 acres, while meadows cover 2,800,000 acres. The farm-stock in the year 1886 consisted of 272,700 horses, 1,530,800 head of cattle, 802,700 sheep, 1,161,200 goats, and 458,200 pigs. Dutch sheep, very large in size, were formerly exported to England in great numbers, until disease stopped the trade, and the same thing happened with cattle. In 1889 the British Privy-council again authorised the importation of live Dutch cattle and sheep. Dutch farmers have suffered heavily through cattle disease, which was at its worst in 1874; but the government has succeeded in stamping it out entirely. Dutch beef and Dutch milch-cows are much esteemed in England and in America. The United States and South Africa buy many horned cattle in Holland for breeding purposes, also Friesland horses, which are extremely strong, and Holland trotters. Dairy-farming had fallen off very much, especially in Friesland, once famous for its butter, because the Dutch dairy-farmers clung to antiquated methods, and so were outstripped by foreign competitors. Holland, formerly one of the chief markets for dairy produce, has now become the principal producer of butter substitutes. But, taught by disastrous experience and the example of Denmark, the Dutch dairy-farmers are at last introducing the 'factory system' and other improvements. Holland exported in 1895 butter to the value of £1,403,000, and cheese to the value of £1,160,000. The common Dutch cheese comes from Gouda, and the round balls are from Edam in North Holland. The staple agricultural products are wheat, rye, oats, potatoes, beet-root, chicory, flax, and tobacco. The use of modern implements, such as steam-ploughs, &c., is now spreading rapidly, like the application of artificial manures.

The soil of Holland is not uniformly fertile. Large tracts of land, especially in the eastern provinces, are simply heath; and the waste lands of Holland covered an area of more than 1,700,000 acres in 1897. A society has been founded for the afforestation of these tracts. The orchards of Boskoop, producing excellent fruit, like the prolific district of Westland, should be mentioned, as also the famous culture of Dutch bulbs at Haarlem and the surrounding districts.

Minerals. As may be readily believed, minerals are scarce in Holland; but valuable clay for the manufacture of tiles, bricks, and pottery is found everywhere in great abundance, and the making of the famous old Delft ware is now reviving. Coal is worked in Limburg, and also a soft sandstone.

Manufactures, Industries, &c. The chief manufactures are linen, woollen, cotton, and silk fabrics, paper, leather, glass, &c. Leyden, Tilburg, and Veenendaal are famed for woollen blankets, wool-dyed pilot, fine cloths, and friezes; 's Hertogenbosch (Bois-le-Duc) for linens and rich damasks. Calicoes, shirtings, drills, table-cloths, striped dimities, &c. are made at Almelo, Amersfoort, and other leading towns. Excellent imitation Smyrna carpets are manufactured at Deventer, and imitation Scotch and other kinds are made at Delft, &c.; turkey-red yarns, dyed silks, and silk stuffs at Roermond, Utrecht, Haarlem, &c.; leather, glass, firearms at Maastricht and Delft; iron-founding, rolling and hammering of lead and copper, cannon founding are carried on at The Hague, &c. Breweries are numerous (541 in 1887): Middelburg, Bois-le-Duc, Amsterdam, Nimeguen, &c. have important ones, those of Bois-le-Duc and Amsterdam manufacturing large quantities. Waalwijk, Heusden, and surrounding districts manufacture boots and shoes. Gin is distilled at Schiedam, Delft, Rotterdam, and Amsterdam. The distilleries of gin ('Hollands') form an important branch of Dutch industry, over 500 existing at the end of 1897. The liqueur factories are of national importance. Amsterdam once had the largest diamond-cutting trade in the world, 10,000 persons depending on that branch of industry; but latterly, owing to various causes (the dearness of rough stones being one of them), the trade has fallen off. Sugar-refining was carried on by 11 establishments in 1895, and there were then also 30 beetroot sugar factories, 50 salt-works, and nearly 600 breweries. The manufacture of cocoa has assumed enormous proportions in the last few years, and there are large works at Weesp, at Amsterdam, and at Rotterdam. North Brabant is the principal centre of the Dutch margarine trade, exported to England in immense quantities. Something like nine tenths of all the margarine sent to England (value £2,498,500 in 1896) comes from Holland.

Fisheries.—The fisheries of Holland, although no longer so important as at one time, are still noteworthy. At the end of 1895 they gave employment to 17,650 men and boys, on board 5189 vessels. The herring-fishery produce annually between 3,000,000 and 4,000,000 barrels from the North Sea alone, and 300,000 tons of salt herrings may be exported in a single year. Trawling is extensively resorted to. 'Dutch coopering' has been virtually abolished by the international North Sea Conventions (see COOPERAGE). Between 25,000,000 and 35,000,000 oysters are annually taken, and a fourth thereof exported to England. The fisheries of Holland are estimated to yield annually £3,000,000.

Imports, Exports, and Shipping. The Dutch are no longer the 'carriers of Europe,' but their carrying trade is still very considerable. The total imports into Holland and exports thence were, in 1894, £121,750,000 and £95,000,000; and the imports from and exports to the United Kingdom in 1894 were £27,600,400 and £8,787,500 respectively. Holland of all European countries does the largest amount of foreign trade per head of population; in 1888, £37, 7s. 1½d. per head (more than thrice that of Great Britain and Ireland). In 1895 the mercantile marine consisted of 425 sailing-vessels of a burden of 110,800 tons, and 157 steamers of 183,000 tons.

Revenue, Expenditure, &c. The revenue of 1890 was estimated at about £10,109,000, and the expenditure at £11,256,000. The East Indies revenue for 1890 was estimated at £10,677,000, the expenditure at £11,700,000. The East India colonies, once a burden, were long a source of profit, but are now a burden again. From 1850 to and with 1874 £25,376,218 was paid off from the national debt. In 1880 the debt amounted to £78,601,216, and the annual interest payable on it was £2,328,000; in 1888 the debt proper was upwards of £88,000,000, besides £1,250,000 in paper money. The annual charge, even after a recent reduction, was still estimated at £2,581,000 for 1890. The great bulk of the national debt is held in Holland; the national prosperity is increasing, and an enormous amount is invested in foreign funds and American railways.

Colonies.—The colonies of Holland are stated to have an area of upwards of 700,000 sq. m. (more than three times the area of the German empire), with a population of about 30,000,000. They fall into two groups: (1) the East Indian possessions, including Java and Madura, Sumatra, the Moluccas, Celebes, Timor, parts of Borneo, and the western part of New Guinea; and (2) the West Indies, of which the chief are Surinam and Curaçao. The factories on the coast of Guinea were disposed of by sale to Great Britain in 1872. The principal colonies are treated at length in separate articles.

Government. The government of Holland is a limited constitutional monarchy. The modern *Grondwet*, or Constitutional Law, of 1848, was altered in 1887 to suit new electoral and other requirements. The crown is the executive power; legislation is vested in the States-general. The king presides at a council of state, whose members are appointed by him. Its functions are similar to those of the Privy-council in Britain. He also selects ministers, who countersign all royal decrees, and whose responsibility is settled by a special law. The States-general is divided into a first and a second chamber. The second chamber consists of one hundred members, the first chamber of fifty members, the former being elected by direct suffrage, the latter by the provincial councils from among the highest-taxed citizens in the state, or those that hold or have held important public posts. The members of the second chamber are elected for four years. Only male subjects thirty years old, in the full possession of their civic rights, are eligible. Each member receives by way of salary £166 a year, and, besides, a stipend for travelling and incidental expenses during each session. The members of the first chamber are elected for a term of nine years. No one can be a member of the two chambers simultaneously. Ministers may sit in both, but only possess a consultative voice. The second chamber alone has the right of amendment and of initiating legislation. All judges are appointed by the crown for life. There is a supreme tribunal (at The Hague), and ministers, members of the States-general, and certain high officials can be arraigned only before it. There is no state religion, but the state supports financially the different churches.

Education.—Primary instruction is provided by the state in all places where it is required. Private

schools are freely permitted, but subject to inspection; and teachers must qualify for their task under a government examination. There are ancient universities at Leyden, Utrecht, and Groningen, and since 1877 a new university at Amsterdam, supported by the municipality. The four universities have upwards of 3000 students. There are Latin schools in the leading municipalities. There are also the Royal Military and Naval Academy at Breda, and that for engineers and the Indian civil service at Delft, besides seminaries in several places for the training of the Roman Catholic clergy, &c. The state pays 30 per cent. of the expenditure on the public schools, and the communes or parishes 70 per cent. In 1895 there were over 3000 elementary public schools, 1351 elementary private schools, and about 150 secondary schools. The pupils in the public elementary schools number 475,000. About 600,000 children under twelve receive some sort of school education, but 10 per cent. none. There is no compulsory attendance in Holland, and many can neither read nor write (5 per cent. of illiterate recruits).

Army, Navy, &c.—The strength of the regular army in Europe is about 62,000 men, and of the colonial army about 40,000 men, some 15,000 thereof being Europeans. Dutch troops are not allowed to be sent to India. The Dutch home army is composed of volunteers, and of a varying proportion of men drawn by lot for five years' service. There is also a local force, called *Schutterij*, drawn by lot from those between twenty-five and thirty-four years of age, to assist in keeping order in peace, and in case of war to act as a mobile corps, and do garrison duty. North and South Holland can be inundated at short notice.

The royal navy on 1st January 1897 consisted of 120 men-of-war, 24 being ironclads. Six are large cruisers, each of 3400 tons, built of iron and steel. There are also numerous torpedo boats for the defence of the coasts and river-mouths.

History.—About a century and a half before our era, a Teutonic people, known to the Romans as the Batavi, and who came from Hesse, occupied the land between the Rhine and the Waal. At this time the Frisians occupied the country north of the Rhine to the Elbe. The Batavi and Frisians differed little in appearance, manner of life, and religion. They clothed themselves with skins, fished, hunted, and led a pastoral life; were faithful, frank, chaste, and hospitable. The songs of the bards composed their literature and history. Warlike and brave, they selected their leader for his courage and prowess, and were armed with a bow and a short spear. They worshipped the sun and moon, and held their meetings in consecrated woods.

The Romans having subdued the Belgæ, next attacked the Frisians, who agreed to pay a tribute of ox-hides and horns, but continued restless and rebellious. The Batavi became allies of Rome, paying no tribute, but supplying a volunteer contingent, chiefly of cavalry, which was renowned for its impetuous bravery, and helped to win the battle of Pharsalia for Cæsar. About 70 A.D. Claudius Civilis, a Batavian, made a bold effort to overthrow the Roman power in Rhenish or Germanic Gaul, but failed in the end. Roman supremacy endured until the 4th century, when the inroads of the Salic Franks were followed by the Saxons and other tribes. The Franks took possession of the *Insula Batavorum*, and the name of the Batavi vanished. Christianity spread among these tribes, and even the Frisians, who were violently opposed to it, were forcibly converted by Charles Martel. At the end of the 8th century all the Low Countries submitted to Charlemagne, who built a palace at Nimeguen, on the Waal. The feudal system now began to develop itself, and dukedoms, counties, lordships, and bishoprics arose, the bishops of Utrecht, the dukes of Guelderland, and the counts of Holland being among the most powerful of these petty rulers, who owned but very little allegiance to their lords. During the 9th and 10th centuries the districts of the modern Netherlands belonged to Lotharingia, which acknowledged alternately French and German sovereignty. The nucleus of the countship of Holland, and the beginning of its power, were the work of Dirk III., who died in 1039. Count William II. was even made King of the Romans (1248) through the influence of Pope Innocent IV. The Crusades weakened the power and resources of the nobles and prelates, so that, during the middle ages, cities began to assume importance, strengthen themselves with walls, and choose their own rulers.

In 1384 the earldom of Flanders passed, through marriage, to the Duke of Burgundy, whose grandson, Philip the Good, made it his special life-effort to form the Netherlands into a powerful kingdom. He bought Namur, inherited Brabant with Limburg, and compelled Jacoba of Bavaria to resign Holland and Zealand. Charles V., as heir to Burgundy, inherited and united the Netherlands under his sceptre. He fostered trades and industries in the Low Countries, and under his rule they attained a great prosperity, whilst cities like Bruges and Ghent reached the zenith of their wealth and power. But he also tyrannised over the land with an iron will and hand, drained the life-blood of the nation for his continual warfare, and depopulated north and south by an implacable Inquisition, which it is computed put to death in various forms at least 100,000 persons for heresy. Yet he was at times popular with the people. He spoke their language. He always remained a Fleming; and Ghent, after attempting to betray him and rising in rebellion against him in 1539, owed her ultimate escape from the destruction which Alva counselled entirely to the fact of the emperor's citizenship. His son Philip II., who succeeded to the throne in October 1555, was a character of the very opposite type. A Spaniard born, he remained a Castilian to his dying day—austere, harsh, narrow, domineering, fanatical. He never spoke a word of Dutch, nor did he understand the people. With Philip II. commenced that terrible and desperate and long-fought struggle of Holland and Spain which finally resulted in the throwing off of the Spanish yoke, in the establishment of a free, strong, and prosperous commonwealth among the marshes of the low-lying delta. This heroic contest of the few against the many, of a handful of isolated burghers against the combined forces of the most powerful state in Europe, has excited a wonderful amount of interest in the civilised world. Motley, with the now countless editions of his great work, *The Rise of the Dutch Republic*, and its continuation, has done more to popularise the story of the so-called Eighty Years' War of the Low Countries against Spain than any of his predecessors.

Philip II. only remained in Holland for four brief years and then left it, never to return, appointing as regent Margaret of Parma, mother of the famous Farnese, and a natural daughter of Charles V., with a council, to which belonged Viglius, Berlaymont, the afterwards notorious Cardinal Granvella, Bishop of Arras—all friends and flatterers of the young king and enemies of the people—as well as Egmont, who had won the battles of St Quentin and Gravelines for Philip, and the king's lieutenant in Holland, Zealand, and Utrecht, young William of Orange, then completely unknown to fame. As the latter took leave of Philip, who was embarking at Flushing to return to Spain, the king bitterly complained to him of the opposition already mani

bested against his measures. These were mainly the maintenance of a standing Spanish army and of the Inquisition—both contrary to the laws and privileges of the people, as well as to his own solemn vows before ascending the throne. Orange tried to persuade the king that he had nothing to do with the resistance complained of, as the Estates were acting on their own responsibility when they had petitioned his majesty. Whereupon Philip seized the Prince of Orange by the wrist, shaking it violently, and exclaiming in Spanish, *No los Estados, no vos, vos, vos!* ('Not the Estates, but you, you, you!'). The king on this memorable occasion showed as much perspicacity as his reign betrayed perverseness and perfidy. In William of Orange, then only twenty-six years old and six years his junior, Philip had truly recognised his worst foe, his most dangerous opponent, and the soul of the coming struggle against the royal authority. The king's secret correspondence is there to confirm this view. Born on 16th April 1533, William belonged to an ancient family ruling a small principality in the south of France (see ORANGE), but his ancestors, originally vassals of the pope, had settled in the Netherlands, where they occupied high functions under the princes of the House of Burgundy. William had been a favourite with Charles, whom he accompanied everywhere. It was thus that William had been able to acquire that profound knowledge of the military art, and to grasp the intricacies of the prevalent occult diplomacy in which he afterwards proved himself such a consummate master. It was while he was hunting with the king of France in the Forest of Vincennes that Henry II. communicated to William of Orange the fiendish plot France and Spain had concocted to massacre all the Protestants in both countries. Henry II. did not know then the man to whom he had been so communicative: he had spoken to William the Silent. The prince never betrayed the least emotion. He buried in his bosom the project of a crime which, although a devout Catholic himself (though a Protestant afterwards), he had resolved to prevent at all hazards. He saw the storm coming. He determined to face it, to devote his fortune, his best powers, and his life to the cause of the weak against the strong, of the free against crushing despotism, fighting Philip with his own weapons, and having but one noble, self-sacrificing ambition—the welfare and the liberty of the people.

There is no doubt that Philip was betrayed by those in whom he had most implicit confidence, and that William of Orange knew of all the king's intentions and movements. Thus he was aware that Alva had collected an army in Italy by the orders of Philip in order to extirpate an abominable rebellion of heretics by sword, and re-establish the Inquisition. The prince warned his friends Egmont and Hoorn in good time against the imminent danger; but they heeded not what he said, and paid for their folly on the scaffold of Brussels as soon as Alva had arrived there with 10,000 picked troops and had established his Council of Troubles. This was no better than a council of butchers, and by means of it 20,000 inoffensive burghers were hurried to their doom. William escaped to Germany in order to organise the national defence with his brothers. But his task was well-nigh hopeless. What could he do with a handful of half-paid and under-fed hirelings? In 1572 the position of affairs could scarce have been more desperate. The Spaniards were absolute masters of the land, and the people, crushed under a reign of bloody rapine, had ceased to hope for deliverance, when the bold capture of Briel, by the Beggars of the Sea, on the 1st of April 1572—a great date in Dutch history, duly honoured in 1872—changed the whole aspect of affairs. They were marauders, those Beggars of the Sea, desperadoes clinging to the broad, hospitable ocean, after having been driven from the land by the Spaniard; but they were also patriots who had adopted as a title of honour the opprobrious epithet that Berlaymont had given them when they were petitioning the regent for the maintenance of their rights, and they held Briel for 'Father William.' Their daring capture became the sign of a general revolt, and soon William the Silent was again at the head of affairs, 'in the name of the king,' still nominally maintained as the ruler of the land. Orange's projects, which consisted of a junction with the French Huguenots, were indeed direfully frustrated by the butchery of St Bartholomew. The southern portion of the Low Countries could not be delivered from the clutches of the enemy and were for ever lost to the cause of freedom; but the north continued the struggle single handed, and at last Alva had to depart in disgust without having accomplished his mission. His successors could do nothing to retrieve Philip's fortunes or damp the inspiriting influence which the heroic defence of towns like Haarlem, Leyden, and Alkmaar had infused into the burghers of the new state. The military chest of the Spanish commanders was always empty, as the Dutch, masters on the sea, cut off all supplies, and revolts were frequent among the Spanish soldiery. Ottavio Farnese, Duke of Parma, who succeeded to the lieutenancy in 1578, saw but one way of settling the question, and that was the forcible removal of William of Orange. Philip, who had held all along the same sinister designs, was only too eager to fall in with this plan. In June 1580 there appeared that infamous ban, which declared William a traitor, a miscreant, and an outlaw, putting a heavy price upon his head (25,000 gold crowns), and promising the king's pardon and titles of nobility to whosoever might be found willing to rid the land of him. William replied in his famous *Apologie*: but he was not able to cope with a royal assassin. Numerous attempts against the prince's life were made, and although they failed for a time, the bravo's work was finally accomplished. Balthasar Gerards, the miserable instrument of a royal murderer, shot William dead with a pistol, purchased with the very money the prince had given him by way of alms to a 'poor Calvinist.' This took place at Delft on 12th July 1584, near the top of a staircase which has been preserved in the same state ever since. Gerards was arrested, tortured, and finally put to death in an atrocious manner; but no expiation, however awful, could bring to life again the noble patriot.

The blow was crushing and irreparable, yet William might have fallen at a moment even more critical to Holland than July 1584. He did not leave his country in a state of paralysed chaos. The Union of Utrecht, accomplished in January 1579, had cemented the alliance of the northern provinces banded together against the king of Spain; and the solemn declaration of July 1581, by which the free Netherlands for ever renounced their allegiance to Philip II., had virtually completed William's task of deliverer. His manifesto of renunciation and denunciation would alone have sufficed to stamp him as a man of genius in the eyes of posterity. It is a remarkably clear, bold, and spirited defence of a people's rights against the claimed rights of the anointed king at a time when the former had been forgotten. Yet William's doom, far from undoing his work, as Philip and Parma hoped, only tended to make it more durable. The bloody deed seemed to spur the whole nation to a revolt fiercer than ever. Maurice of Nassau followed in his father's footsteps, and the successes of the Dutch, especially at sea,

became more numerous. Parma, indeed, took Antwerp after a long siege, but failed to effect a junction with the Armada in 1588, as the Hollanders prevented his fleet from leaving the Scheldt; and when the great general died in 1592, six years before his master, he had not accomplished his mission. Philip III. was not more fortunate, and could do nothing better than sign in 1609 the twelve years' armistice with the 'rebels,' who were already masters of the sea, had laid the foundations of their great Indian empire by the establishment of the East India Company in 1602, and practically had made their own conditions. Maurice had been against the armistice, but he was overruled by the States, who wanted peace for trading. Unfortunately, the breathing time to 1621 was in a large measure filled up with religious and political dissensions between the adherents of Gomarus, the orthodox Lutherans, and the Arminians, the milder-mannered followers of Arminius, to whom Hugo Grotius and other celebrated men of the time belonged. These disputes culminated in the persecution of the Arminians, who were forced to flee, like Grotius, or were put on their trial for high-treason, like Olden Barneveldt, the Grand-pensionary of Holland, and one of her most distinguished sons, who was beheaded in 1618 with the approval of Maurice. But these internal troubles did not check the progress of the new republic. Maurice died in 1625, and his brother Frederick Henry finally freed his country from the Spaniards, who in 1648 were compelled to recognise the 'rebels' as an independent nation by the treaty of Munster.

In this epoch lies, perhaps, the period of Holland's greatest material and intellectual development. Her ships could be seen everywhere, and the Dutch had become the general carriers of the world's trade. Amsterdam, grown powerful and rich, was the Venice of the north, where, besides commerce proper, both banking and stockbroking reached a flourishing stage at an early period. From this emporium started the fleets of the great trading companies, and the vessels of intrepid explorers like Hudson, Heemskerck, Houtman, Lemaire, Tasman, and many others. Dutch agriculture and floriculture, gaining new experience and teaching fresh methods, grew famous, and so did many branches of science and industry. The first optical instruments came from Holland, and Huygens gave us the pendulum-clock. Arts and letters flourished, and the names of Erasmus, Grotius, Vossius, Burman, Gronovius, Boerhaave, Spinoza, Huygens, Rembrandt, Cuyp, Van der Helst, Hobbema, Potter, and many more became known and illustrious far beyond the national frontiers. The art of printing, perhaps not a glory of Holland in its inception (see PRINTING), had at anyrate attained a high degree of perfection there in the 17th century, as the names of Plantin and Elzevir testify. The liberty of the press, secured at an early date, led to the establishment of numerous newspapers, Dutch and foreign. The foreign news-sheets of Holland, mostly published in French, were sent all over the world, as they contained the latest intelligence and things that were not allowed to appear in print elsewhere. The *Gazette de Leyde* was among the oldest and most powerful of these early journals (1680–1814).

The rising power of Holland had the natural result of creating envy and cupidity in her nearest neighbours. The first serious antagonism came from England, where trade and navigation were also rapidly coming to the front. Both countries were then pure commonwealths—Cromwell ruling in England, and the Grand pensionary John de Witt having virtually the destinies of the United Provinces in his hands since the death of Frederick Henry's son, the last stadtholder before William III. Cromwell's Act of Navigation, which aimed at the destruction of Holland's monopoly in the carrying trade, led to the great naval war of 1652–54, during which twelve important battles, more or less decisive, were fought, and both nations distinguished themselves by the intrepid daring of their commanders and seamanship. Yet otherwise the result was barren, though the names of De Ruyter, Tromp, Evertsen, and Van Galen shone forth ever afterwards. These hostilities between Holland and England were renewed when Charles II. had been restored by General Monk; but the war of 1664–67 remained as undecisive as its predecessor, despite De Ruyter's daring feat of sailing up the Medway, which caused for a while wild panic in the British capital.

An ensuing war with France, now allied with England against the United Provinces, was much more serious, as De Witt had done his best to strengthen the navy, but at the cost of a totally neglected army. The hosts of Louis XIV., under captains so famous as Condé and Turenne, made short work of all resistance that Holland could offer on land, although De Ruyter's fleet kept the allied squadrons at bay, and thus, probably, saved his country from political annihilation. At the most critical juncture a violent popular reaction set in against De Witt and his brother Cornelis, and in favour of the young Prince of Orange, who had been held back by their party. John de Witt, one of the most clear-headed and bold statesmen of his day, was murdered as a traitor by an infuriated mob at The Hague, and the stadtholdership re-established in the person of a prince then (1672) only twenty-two years of age. But the people's instinct had been right after all, for William III.'s accession proved the salvation of Holland, as it also accomplished, later on, the political regeneration of England. The fortunes of the war changed immediately with William at the head of affairs. He showed himself an able tactician and a still more skilful diplomatist. By dexterously manœuvring between Holland's enemies he managed to gain time and isolate France. At last, in 1678, Louis XIV. was compelled to sign the treaty of peace of Nimeguen, as William had become, for the time being, the ally of the king of England, by his marriage with Mary, daughter of the Duke of York. William was not satisfied with what the peace of Nimeguen gave to Holland; and the following years were passed in preparing for the great events which he no doubt saw rapidly approaching. The revocation of the Edict of Nantes flooded Holland once more with political refugees, who here found a new fatherland, and who subsequently helped to fight the battles of Europe against their common tyrant. In the English Revolution of 1688 by William III., many of these Huguenots played an active and prominent part. To Holland the inauguration of the new era in England did not mean peace, but it meant an honourable alliance and security from further encroachments of the French king. The Dutch troops fought bravely in the battles of England, even after William's death in 1702; and Ramillies, Oudenarde, and Malplaquet, which saw Louis's greatest humiliation, were as much Dutch victories as La Hogue was an English victory.

The peace of Utrecht, in 1713, marks the close of Holland's activity as a great power in Europe. For her the 18th century was the century of demoralisation and decay. After William's death she became a republic once more; the stadtholdership was re-established in 1747, but it made no difference in the downward course. The National Convention of France having declared war against Great Britain and the stadtholder of Holland in 1793, French armies overran Belgium (1794); they

were welcomed by the so-called patriots of the United Provinces, and William V. and his family (January 1795) were obliged to escape from Scheveningen to England in a fishing smack, and the French rule began. The United Provinces now became the Batavian Republic, paying eight and a half millions sterling for a French army of 25,000 men, besides giving up important parts of the country along the Belgian frontier. After several changes Louis Bonaparte, 5th June 1806, was appointed king of Holland, but, four years later, was obliged to resign because he refused to be a mere tool in the hands of the French emperor. Holland was then added to the empire, and formed into seven departments. The fall of Napoleon I. and the dismemberment of the French empire led to the recall of the Orange family and the formation of the southern and northern provinces into the ill-managed kingdom of the Netherlands, which in 1830 was broken up by the secession of Belgium (q.v.). In 1839 peace was finally concluded with Belgium; but almost immediately after national discontent with the government showed itself, and William I. in 1840 abdicated in favour of his son. Holland being moved by the revolutionary fever of 1848, King William II. granted a new constitution, according to which new chambers were chosen, but they had scarcely met when he died, March 1849, and William III. (born 1817) ascended the throne.

The bill for the emancipation of the slaves in the Dutch West Indian possessions, passed in 1862, decreed a compensation for each slave, and came into force in 1863. The expenses of this emancipation came to £1,065,366, and the number of slaves set free was about 42,000, of whom 35,000 were in Dutch Guiana.

In 1863 the naval powers bought up the right of the king of Holland to levy toll on vessels navigating the river Scheldt (q.v.), the king of Belgium binding himself also to reduce the harbour, pilot, and other charges on shipping within that kingdom. In 1868 the Luxemburg (q.v.) question was settled in a manner satisfactory to Holland. Next year capital punishment was abolished. In 1872 a new treaty with England, defining and limiting the sphere of influence and action of Britain and Holland in the Indian Archipelago, and removing the restrictions of the treaty of 1824 as to Sumatra, was followed by a war with Atcheen, until then an independent Malay state in North Sumatra (see ACHEEN), a war that severely taxed the military and financial resources of the Dutch-Indian government, and is still carried on, in a modified form, the so-called conquest of 1873–75 notwithstanding. William III. having no living male issue, the succession to the crown was vested in the Princess of Orange, Wilhelmina, the only child of the king's second marriage, born in 1880. For many years the great question of internal politics was the new constitution, which, promulgated November 30, 1887, increased the electorate of Holland by no less than 200,000 voters. A revision of the school-laws in a sectarian sense was carried in 1889. In 1888 the queen, Emma of Waldeck, had been appointed regent in the event of the king's demise; and on the death of the king (23d November 1890), when Luxemburg ceased to be connected with the crown of Holland, the Princess Wilhelmina became queen.

Language and Literature. Dutch is an essential link in the chain of Teutonic languages, a wonderful storehouse of old and expressive Germanic words and phrases. It has been said that Old English is Dutch, and to no other nation is the study of the Netherlandish more interesting than to the English. Without a knowledge of Dutch it is almost impossible to properly understand the historical development of English. It is a common mistake to suppose that Dutch is merely a German dialect. As a language it has existed as long as German, and passed through the same series of evolutions. It possesses many affinities with German, because, like Frisian, Danish, &c., it sprang from the common Teutonic stock (see DUTCH; and for the relation of Dutch and Low German to High German, see GERMANY, Vol. V. p. 186); but between modern High German and modern Dutch there is less similarity in vocabulary than between modern English and modern Netherlandish, although the pronunciation differs much more in the latter case. Three great periods of development must be distinguished in the Netherlandish language, as in the German; the first was the period of inception, or of Old Netherlandish, when doubtless various Teutonic dialects existed among the tribes and peoples that had penetrated westward from the Elbe and the Oder. A curious relic of this ancient Netherlandish exists in a fragmentary translation of the Psalms, dating from the 9th century. It does not seem to belong to any one language, but looks like an attempt at combining the dialects then existing. The second period comprises the Middle Netherlandish, which developed soon after the 11th century, and became the popular tongue of a very considerable area, spreading far beyond the Rhine in the east, and covering not only the greater part of Belgium, as it now exists, but also the northern portions of France, where Old Dutch persists to this very day in the villages, with the wondrous tenacity of popular tongues. The second period is rich in *fabliaux* and romances of chivalry, but these were nearly all of foreign origin, mostly French and some English. Among them we name *Ferquut*, *Roman van Lancelot*, *Walewein*, *Floris en Blancefloer*, all republished of late, but not easily understood without a dictionary of Middle Netherlandish. *Reinaert* (see REYNARD THE FOX) is a truly national epic of considerable importance. But the most prominent representatives of Middle Netherlandish literature are Jakob van Maerlant (13th century) and Jan Boendale (14th century). The former was the author of the famous *Spieghel Historiael*; the latter wrote didactic poems, the best known of which is *Der Leken Spieghel*. To this period also belong Jan van Heelu's description of the battle of Woeringen and Melis Stoke's chronicles of Holland.

The origin of new Netherlandish or Dutch is to be found with the *Rederijkers*, whose rise can be traced to the commencement of the 15th century. They were mainly lovers of letters and the theatrical art, banded together in *Kamers*, 'chambers,' or clubs, for the purpose of study and mental recreation. In the course of time, when the troubles with Spain arose, these clubs no doubt also became centres of political agitation, and this led to their suppression in the southern provinces; but in the north, as soon as political freedom had been attained, they developed into literary associations of considerable importance. The most famous was the 'chamber' called *In Liefde Bloeijende* ('thriving in love') at Amsterdam, to which Coornhert (1522–90), Spiegel (1549–1612), and Roemer Visscher (1547–1620) belonged, the latter a literary merchant, and the father of two ladies who became celebrated for their learning amongst the men of letters of that period. Coornhert, Spiegel, and Visscher in 1584 caused a Dutch grammar to be published, and this may be called the foundation-stone of modern Netherlandish. Hooft (1581–1647) was the first to recognise the worth of his mother-tongue and to write a classical Dutch in which he strove to eliminate as much as possible all foreign elements, although a great admirer of classical lore and foreign literature, especially

French and Italian. At Muiden he formed a literary club which exercised very great influence. Hooft wrote his *Historiën*, but he also excelled in poetry and in the drama. Among his famous contemporaries is Vondel (1587–1679), who is considered the greatest of Holland's poets, and who, indeed, soars high in his dramas, still performed before appreciative audiences in our days. Milton, it is said, borrowed from Vondel, and passages taken from the masterpieces of the two poets certainly bear a curious resemblance. Vondel, some of whose dramatic works have been translated into German and English, was a very prolific poet. Yet his poetry can hardly be called so popular as that of Jacob Cats (1577–1660), whose maxims were for a long time, with the Bible, the only book found in every cottage. Cats is witty, but coarse; and Bredero, whose comedies deserve mention, is scarcely better in this respect. Van der Goes, who composed a beautiful poem on Amsterdam, ranks among the best of Vondel's disciples (1647–84); Oudaen (1628–92) is noted for his political poems and his dramas; Constantyn Huyghens, the father of the great mathematician, for his epigrams and his didactic poetry (the *Korenbloemen*, 'cornflowers,' is still read and admired); and Brandt, for his historical writings.

This is the great period of literary activity in Holland previous to the revival which marked the end of the 18th century. Writers who were desirous of being read beyond the limits of their vernacular had to use Latin; and Erasmus, Boerhaave, Grotius, Spinoza, to mention only a few of the most famous, would scarcely have been so well known had they written exclusively in the language of Vondel.

The 18th century is the period also of literary decadence in Holland; the only great names are those of Feith and Bilderdijk (1756–1831). The latter wrote poetry such as has not been equalled since in the Dutch language, and it is a national loss that his great epic poem, *The Destruction of the First World*, remained unfinished. Bilderdijk also ranks high as a historian, and his philological studies deserve credit, though his learning was sometimes misled by his ingenuity. Among Bilderdijk's contemporaries are Helmers, whose patriotic songs against the French created in Holland as profound a sensation as Körner's in Germany, and the two literary ladies, Deken and Bekker, whose novels (one of them translated into German), written in conjunction, are true pictures of Dutch life in those days. The poems of Tollens (1780–1856) came later, and still retain their hold on the popular fancy (especially in the words of the national hymn) notwithstanding the appearance of numerous still more modern competitors, among whom we can only mention here Van Beers, Beets, Da Costa, Schimmel, Hofdijk, and J. Van Lennep. Schimmel is also noted for his dramas and historical romances, the plots whereof he loves to place in England, when not in Holland. Beets has been truly called the Charles Dickens of the Dutch, as his inimitable *Camera Obscura* (sketches of Dutch life) proves. These two authors are not unknown in England and America, as portions of their work have been translated. So have some of the stirring novels of Van Lennep. Hofdijk, who died in 1888, is known for his faithful and eloquent historical writings not less than for his lyrical poetry. Potgieter, Ter Haar, Heye, Ten Kate, and many others have each excelled in a particular branch of poetry. Among noteworthy novelists we must mention Hendrik Conscience, 'Miss Wallis' (a daughter of Dr Opzoomer), and Mrs Bosboom Toussaint; and we cannot conclude without paying a tribute to the undoubted gifts of 'Multatuli' (Douwes Dekker), whose *Max Havelaar* has been translated into nearly every European language. 'Maarten Maartens' writes powerful novels in English; and Maeterlinck has been called 'the Flemish Shakespeare.' In law and theology the names of Opzoomer, Kuenen, and Kern are almost as well known without as within the kingdom.

In this necessarily rapid sketch we have made no distinction between Dutch writers in Belgium and Dutch writers in Holland. In fact, there is no distinction; they express their thoughts in the same language. The words 'Flemish' and 'Flemlander' have been invented by the French, and only serve to obscure what is a fact—viz. that there never has been a greater difference between the Dutch as taught at Antwerp and the Dutch as taught in Amsterdam than between Boston, Edinburgh, or Manchester English. There have been slight varieties in the spelling; but these have disappeared since the orthography of 1864 has been adopted in both the north and the south, and modern Netherlandish is now the language of some 7,000,000 Netherlanders, of whom 2,500,000 politically belong to Belgium. This is perfectly well understood in the two countries themselves, where Dutch philological and literary congresses are annually held in a northern and a southern centre by turns. In Belgium there are more Dutch than Walloons, and the Belgian constitution does not recognise a preponderating French language. No doubt the Dutch Belgians have only latterly insisted upon the maintenance of their rights in this respect; but ever since the so-called 'Flemish movement' commenced they have steadily gained ground, and all the French encroachments are being swept away. Dutch is being taught everywhere in the schools, and a knowledge of Dutch is essential in many functions, even in those of the king, who was taught Netherlandish by the great novelist Hendrik Conscience. The latter was one of the prime movers in the Dutch reaction in Belgium, wherewith the names of Willems, Blommaert, Snellaert, Snieders, Hiel, Van Beers, &c. will for ever remain associated—some as fiery poets, some as noted prose-writers.

For statistics, consult the annual *Staatsalmanak*, which possesses a semi-official character; the publications of the Dutch Statistical Society, Amsterdam, particularly *Jaarcijfers*, a statistical annual in French and Dutch, in two parts, one of which deals with the colonies; the *Algemeen Statistiek*, in several volumes, which is an official survey of the kingdom, with full particulars, but now somewhat antiquated in many details; the annual reports of British consuls in the Netherlands; the *Almanach de Gotha*, &c. For general descriptions and travel, see the works of Montegut, Esquiros, and particularly Henri Havard; his volumes in pleasant French (three of which, *The Heart of Holland*, *Picturesque Holland*, and *The Dead Cities of the Zuyder Zee*, exist in English) have much contributed towards propagating sound knowledge of the land and people. D'Amicis' *Olanda* (trans. into English) is also useful. For history, the writings of Prescott, Motley, Thorold Rogers, Wagenaar, the very valuable collections of Gachard and Groen, the histories of Th. Juste, Bilderdijk, Fruin, Arend, Nuijens, Hofdijk, &c. (all in Dutch, except Juste, who wrote in French) should be consulted. The most accessible literary history is Schmeder's *Geschichte der Niederländischen Literatur* (Leip. 1888), which is also the best in every way.

Holland, in contradistinction to the kingdom of that name, is the oldest, wealthiest, and most populated part thereof, forming two provinces, North and South Holland. The province of North Holland has an area of 1070 sq. m., and a population of 906,136 in 1895. It comprises the peninsula to the west of the Zuyder Zee, and also the islands that fringe this great gulf on its northern side. To the west North Holland is bounded by the German Ocean, and to the south by the province

of South Holland. This latter province has an area of 1162 sq. m., lying between the German Ocean and the provinces of Zealand, Utrecht and North Holland. It had a population in 1021,880 in 1895. The population of both North and South Holland is largely agricultural. It is in these provinces that the best corn is grown, the best cattle reared, and the best dairy produce brought to market. But as the largest towns of the kingdom (Amsterdam and Rotterdam) are also situated in these two provinces, its chief trade and industries, with nearly the whole of its shipping, are carried on in them.

Holland, originally a fine kind of linen manufactured in the Netherlands, and now a coarse linen fabric, unbleached or dyed brown, which is used for covering furniture, &c.

Holland, PARTS OF. See LINCOLNSHIRE.

Holland, LORD. HENRY RICHARD VASSALL FOX, third Baron Holland, F.R.S., was born at Waterslow House, Wilts, in 1773, and succeeded to the title on the death of his father, the second baron, in 1774. He went to Eton, and thence to Christ Church. He was trained for public life by his celebrated uncle, Charles James Fox, after whose death he held the post of Lord Privy Seal in the Grenville ministry for a few months. He then shared the long banishment of the Whigs from the councils of their sovereign. During this long and dreary interval Holland, to use the language of Macaulay, was the 'constant protector of all oppressed races and persecuted sects.' He held unpopular opinions on the war with France; strove zealously to mitigate the severity of the criminal code; made war on the slave-trade; threw his heart into the struggle against the Corn Laws; and, although an aristocrat, laboured to extend the liberties of the subject. In 1830 he became Chancellor of the Duchy of Lancaster and a member of the reform cabinet of Earl Grey, and these posts he also held in the Melbourne ministry. He died at Holland House, Kensington, October 22, 1840. He wrote biographies of Guillen de Castro and Lope de Vega, translated Spanish comedies, prepared a life of his uncle, and edited the memoirs of Lord Waldegrave.—His wife, ELIZABETH VASSALL (1770–1845), daughter of a wealthy Jamaica planter, married in 1786 Sir Godfrey Webster; but the marriage was dissolved in 1797 for her adultery with Lord Holland, who immediately married her. She was distinguished for beauty, conversational gifts, and autocratic ways; and till the end of her life her house was a meeting place for brilliant wits and distinguished statesmen.—Their son, the fourth Lord Holland (1802–59), edited two works by his father, *Foreign Reminiscences* (1850) and *Memoirs of the Whig Party* (1854). See the Princess Marie Lichtenstein's *Holland House* (1873).

Holland, SIR HENRY, physician, was born at Knutsford, Cheshire, on 27th October 1788, and studied at Edinburgh. He wrote a book on his three years' *Travels in Albania, Thessaly*, settled in London in 1816, and soon became one of the recognised heads of his profession. In 1828 he was elected a Fellow of the Royal College of Physicians; in 1840 he was appointed physician in ordinary to the Prince Consort, and in 1852 physician-in-ordinary to the Queen. In the following year he was created a baronet. His *Medical Notes and Reflections*, published in 1839, consist of 34 essays upon various departments of medicine and psychology; it has passed through several editions. In 1852 appeared *Chapters on Mental Physiology*, which are expansions of those essays in his former work which treated of 'that particular part of human physiology which comprises the reciprocal actions and relations of mental and bodily phenomena.' Other books from his pen are *Essays on Scientific Subjects* (1862) and *Recollections of Past Life* (1871). Holland died at London, 27th October 1873. He was related in different degrees to Josiah Wedgwood, Mrs Gaskell, and Charles Darwin, and married for his second wife a daughter of Sydney Smith. See KNUTSFORD.

Holland, HENRY SCOTT, preacher and theologian, was born at Ledbury, in Herefordshire, in 1847, and educated at Eton and Balliol. He took first-class honours in 1870, and, after having been theological tutor at Christchurch and select preacher, he became canon of Truro in 1882 and canon of St Paul's in 1884. He has published some remarkable volumes of sermons, including *Logic and Life* (1882).

Holland, JOSIAH GILBERT, an American author, was born in Belchertown, Massachusetts, 24th July 1819, and graduated at the Berkshire medical college, at Pittsfield, in 1844. He soon abandoned his profession, however, and after fifteen months as a school superintendent at Richmond, Virginia, became assistant editor of the Springfield *Republican*, of which he was part proprietor also from 1851 to 1866. In 1870, with Roswell Smith and the Scribners, he founded *Scribner's Monthly*, which he conducted successfully till his death, 12th October 1881. In this magazine appeared his novels, *Arthur Bonnicastle* (1873), *The Story of Sevenoaks* (1875), and *Nicholas Minturn* (1876). His *Timothy Titcomb's Letters* (1858) went through nine editions in a few months; and this sale was exceeded by his *Life of Lincoln* and his most popular poems, *Bitter Sweet* (1858), *Kathrina* (1867), and *The Mistress of the Manse* (1874). Most of his works have been republished in Britain. See the Life by Mrs Plunkett (1894).

Holland, PHILEMON, styled 'the translator-general of his age,' was born at Chelmsford, in Essex, in 1552. He became a Fellow of Trinity College, Cambridge, and in 1591 took at that university the degree of M.D. He afterwards practised medicine at Coventry, and in 1628 was appointed head-master of the free school there. He died on 9th February 1637. His more notable translations were Livy, Pliny's *Natural History*, Suetonius, Plutarch's *Morals*, Ammianus Marcellinus, Xenophon's *Cyropædia*, and Camden's *Britannia*. His son, Henry Holland, a bookseller in London, published *Heroologia Anglicana* (1620) and *Basilologia* (1618).

Hollands, See GIN.

Hollar, WENCESLAUS (1607–77), etcher. See ENGRAVING, Vol. IV. p. 380.

Holles, DENZIL, LORD, one of the 'five members,' was the son of the Earl of Clare, and was born at Houghton, in Nottinghamshire, in 1599. He entered parliament in 1624, and at once joined the party opposed to the king's government. On March 2, 1629, he was one of the members who held the Speaker in his chair whilst resolutions were passed against Arminianism and tonnage and poundage. For this act he was condemned by the Court of King's Bench to pay a fine of one thousand marks, and to be imprisoned in the Tower during the king's pleasure; he remained there about a twelvemonth. He was one of the members of parliament whom Charles accused of high-treason and attempted to arrest in 1642. On the outbreak of the Civil War he was charged to hold Bristol; but, dreading the supremacy of the army more than he dreaded the pretensions of the king, Holles was a steady advocate of peace. He was a foremost leader of the Presbyterian party. For having in 1647 proposed to disband

the army he was accused of high treason; but, leaving his native land, he found refuge in Normandy. Again, after a brief return visit to England in the following year, he went back to Brittany, and stayed there until Cromwell's death. On his reappearance in England Holles set to work to effect the restoration of the Stuarts; he was the spokesman of the commission delegated to carry the invitation of recall to Charles II. at Breda. In 1661 he was created a peer as Lord Holles of Ishield in Sussex. His last important public duty was the negotiation of the treaty of Breda in 1667. Although thus employed in the service of the crown, Holles still clung faithfully to his love of liberty, and remained staunch in his support of the governing rights of parliament; and as Charles's propensities towards absolutism became more pronounced Holles leaned more to the opposition. He died on 17th February 1680, a man of firm integrity, a lover of his country and of liberty, 'a man of great courage and of as great pride. He had the soul of a stub born old Roman in him.' See *Memoirs* written by himself (1699); also S. R. Gardiner's *History*.

Holloway, a district of London, in the parish and parliamentary borough of Islington, on the N., has a population of 47,924.

Holloway College, situated at Mount Lee, Egham, Surrey, near Virginia Water, is an institution founded in 1883 by Thomas Holloway (1800–83), patentee of Holloway's pills and Holloway's ointment (see ADVERTISING), for the purpose of supplying a suitable education to women of the middle classes. The building, which is constructed in the French Renaissance style, was opened by the Queen in 1886. The management is vested in the hands of twelve governors. Holloway also founded a sanatorium or hospital for the mentally afflicted belonging to the middle classes.

Holly (*Ilex*), a genus of trees and shrubs of the natural order Aquifoliaceæ, chiefly natives of temperate climates; with evergreen, leathery, shining, and generally spinous leaves; small flowers which have a four- to five-toothed calyx, a wheel-shaped four- to five-cleft corolla, four or five stamens, and the fruit globose and fleshy, with four or five stones (*nuts*). The Common Holly (*I. aquifolium*), the only European species, and a native also of some parts of Asia, is a well-known ornament of woods, parks, and shrubberies in Britain, the stiffness of its habit being so compensated by the abundance of its branchlets and leaves as to make it one of the most beautiful evergreens. It is found as a native plant in Scotland, although Britain is nearly its northern limit; and it attains a greater size and displays greater luxuriance in the northern than in the southern parts of its geographic range, often appearing in the former as a tree of considerable size, 20 to 50 feet high, whilst in the latter it is generally a mere bush. It prefers light soils.

Branch of Common Holly (*Ilex aquifolium*): *a*, a flower.

There are numerous varieties of holly produced, or at least perpetuated, by cultivation, exhibiting great diversity in the leaves, of which the *Hedgehog Holly* may be mentioned as extremely simious and spinous, whilst others are prized for their colour, golden, silver-blotched, &c. The flowers of the common holly are whitish, axillary, nearly umbellate, and often dioecious by abortion of the pistil; hence the barrenness of certain varieties, and occasionally also of individual trees of others which are remarkable for having the stamens only or the pistils only perfect as the case may be; the former of course never bear fruit. The fruit is small, scarlet, rarely yellow or white. The abundance of the fruit adds much to the ornamental character of the tree in winter, and affords food for birds: but to man it is purgative, emetic, and diuretic, and in larger quantities poisonous. The leaves are inodorous, have a mucilaginous bitter and somewhat austere taste, and have been used medicinally in cases of gout and rheumatism, as a diaphoretic, and also as an astringent and tonic to correct a tendency to diarrhœa, &c. The leaves and small branches, chopped, are sometimes used for feeding sheep in severe winters. The root and bark are emollient, expectorant, and diuretic. Birdlime (q.v.) may be made from the inner bark. The wood is almost as white as ivory, very hard and fine-grained, and is used by cabinetmakers, turners, musical-instrument makers, &c., and sometimes for wood-engraving. Handles of tools and handles of metal teapots are very often made of it. The holly is often planted for hedges, as it bears clipping well, and makes an excellent fence. A holly hedge may either be kept low, or, as is the case at Tyninghame, in East Lothian, allowed to grow to the height of 20 or 30 feet. In the gardening of former days hollies were often clipped into fantastic shapes. The name holly used to be derived from the very ancient use of the branches and berries to decorate churches at Christmas (said to be connected originally with the Roman Saturnalia), from which the tree was called Holy Tree. Really holly (O. E. *holyn*) shows the same root as in Irish *cuilean*, German *hulse*, Old French *houlx* (see EVERGREENS, and the illustration there). The American holly (*I. opaca*) is common along the Atlantic coast from Maine southwards.—Maté (q.v.), or *Paraguay Tea*, is the leaf of a South American species of holly (*I. paraguensis*). *I. vomitoria* has been erroneously named *South Sea Tea*, from the impression that it was the same as *I. paraguensis*. The Indians smoked it as a substitute for tobacco. *I. cassine* and *I. Dahoon* are natives of the same region of the United States. *I. gongonha*, which grows in the provinces of Minas Geraes and São Paulo, Brazil, has leaves which have been substituted for Paraguay Tea. The fruit of *I. maconcona* contains a great quantity of tannin, and mixed with a ferruginous earth is used to dye cotton.

According to the Darwinian theory of the origin of thorns, spines, and prickles, these structures serve either as a protection against the attacks of the larger animals (the view expressed in Southey's 'Holly-tree') or as climbing organs. The ancestors of the holly are supposed to have had spineless leaves which were eaten by large browsing animals, and thus the holly ran the risk of extermination, until some individuals, dwarfed and checked in growth from the losing of their tender shoots, developed spines which protected them from the attacks of animals. These spine-producing hollies had an advantage over their spineless neighbours and became the survivors. In support of this theory is the fact that many varieties of holly above a certain height develop leaves without spines; and this is explained by saying that these leaves were beyond the reach of animals which

attacked the plant, and therefore spines were not formed on these higher leaves because they were unnecessary. A more recent view of the origin of spines denies altogether the agency of animals. According to this view the bitter nature of holly leaves is sufficient to repel any animal from making food of them. The presence or absence of spines on the leaves is the result of the metabolism of the plant. Those plants which have grown in rich soil under favourable climatic conditions are vigorous individuals with large spineless leaves; while hollies which have grown in poor soil under unfavourable conditions have shrubby stems and small curled spiny leaves. The former plants are healthy and well fed; the latter half starved and ill conditioned. The former are the highly anabolic, the latter the katabolic individuals.

Hollyhock (*Althæa rosea*), a plant of the natural order Malvaceæ, commonly referred to the same genus with the Marsh Mallow (q.v.). It has a tall, straight, hairy stem; heart-shaped, crenate, wrinkled, five- to seven-angled leaves, and large axillary flowers almost without stalks; the leaves diminishing into bracts, and the upper part of the stem forming a spike; the petals hairy at the base. The hollyhock is a native of the Mediterranean, is to be seen in almost every garden in India, and has been much cultivated in gardens in Britain from a very early period. At present it is a favourite flower, and varieties, the result of cultivation, are very numerous. It varies much in the colour of the flowers, and double and semi double varieties are common. It is an autumnal flower, continuing till the frost sets in. The plant is a biennial or perennial, but in the latter condition lasting only for three or four years in a healthy state. The stem rises to a height of 8-15 feet, unbranching, or nearly so. Since 1870-75 the plant has all but succumbed to what is known as the hollyhock disease, caused by a species of fungus (Puccinia) which attacks the leaves and finally proves fatal, unless prompt measures are adopted to arrest its progress. Sulphur dusted on the affected leaves has proved the most effectual cure. The fibres of the plant have been made into yarn, but it is not yet certain if it is really valuable for cultivation on this account, or for the manufacture of paper. It is not improbable that it might be cultivated with advantage to afford green fodder for cattle, which are very fond of its leaves, and the leaves are produced in great abundance if the plant is prevented from flowering. The flowers are mucilaginous and demulcent, and are sometimes used like those of mallows and marsh mallows. The leaves yield a fine blue dye.—The Chinese Hollyhock (*A. chinensis*) is an allied species.

Hollyhock (*Althæa rosea*).

Holman, James, 'the Blind Traveller,' was born 15th October 1786, and, entering the navy in 1798, had risen to be a lieutenant when, in 1810, the loss of sight compelled him to quit the service. Yet, being of an active temperament, he in 1819-21 travelled through France, Italy, and the countries touching on the Rhine. Encouraged by this, he conceived the plan of travelling round the world, and had penetrated to Irkutsk in Siberia, when he was arrested as a spy by the Russian government and carried back to the frontiers of Poland. Nevertheless, undaunted by this failure, he again set off in 1827, and this time effectively accomplished his purpose. Finally, he visited the countries of south-east Europe. He died at London, 29th July 1857. He published *Journals* of his successive journeys, which contain much more useful information than could be expected from the circumstances under which it was gathered.

Holmby House, a fine Tudor mansion, 6½ miles NW. of Northampton, was built by Sir Christopher Hatton in the reign of Elizabeth. It was sold to James I., and was for four months in 1647 the prison of Charles I. (q.v.). It was dismantled in 1652.

Holmes, Oliver Wendell, born in Cambridge, Massachusetts, August 29, 1809, was the son of Rev. Abiel and Sarah (Wendell) Holmes. His father was a Congregational [illegible] minister, the author of *Annals of America* and other works; his mother, descended from a Dutch ancestor, was related to many well-known families in New England and New York. He entered Harvard College at the age of sixteen, and graduated, in what became a famous class, in 1829. He began the study of law, but after a year gave it up, and entered upon the study of medicine. After the customary course at the medical school of Harvard he spent over two years in the hospitals and schools of Europe, chiefly in Paris; and on his return home took the degree of M.D. in 1836. Three years later he was professor of Anatomy and Physiology at Dartmouth College, but after two years' service he resigned and engaged in general practice in Boston. He married in 1840 Amelia Lee Jackson, daughter of a justice of the Supreme Court of Massachusetts. (Three children were born of the marriage, of whom one, O. W. Holmes, jun., served as a captain in the civil war, and is a judge and an eminent writer upon legal subjects.) In 1847 he was appointed professor of Anatomy at Harvard, which place he held until 1882. He was highly respected as a man of science, and beloved as an instructor; but as time went on his literary genius quite overbore his professional zeal, and it is as a poet and essayist that he will be remembered.

He began writing verse while an undergraduate, but his first efforts were not remarkable. While in the law school he contributed to the *Collegian* a few poems of a light and humorous character which first gave indications of his future power; among these are 'Evening, by a Tailor' and 'The Height of the Ridiculous.' There is a reminiscence of his life in Paris in the tender poem beginning 'Ah, Clemence! when I saw thee last.' A little later was written 'The Last Leaf,' which contains one perfect stanza, and which from the blending of quaintness and pathos is perhaps the most fortunate and characteristic of his minor poems. For some years the muse visited him by stealth, the votary fearing for his professional reputation in a town so noted for propriety. A small volume of these early poems was published in 1836. Twenty years passed with desultory efforts and a slowly-growing power, when by the publication of *The Autocrat of the Breakfast Table* (1857-58) he became suddenly famous. No literary event since the *Noctes* had more strongly affected the reading world. The success was due

to its fresh, unconventional tone, its playful wit and wisdom, and to the lovely vignettes of verse. Apart from the merits of thought and style, the pages have the charm of personal confidences; the reader becomes at once a pupil and an intimate friend. The tone assumed is egotistical, but the force and the comedy (as every man with imagination sees) are bound up in that assumption. *The Professor at the Breakfast Table* (1858-59) was written upon the same lines and has qualities equal to those of its predecessor, but it deals with deeper questions and in a less familiar way. *The Poet at the Breakfast Table* (1872) takes the reader into the region of religious and philosophical ideas. 'God is Love' is the keynote of its doctrine. His first effort in fiction was *Elsie Venner* (1859–60), a study of hereditary impressions and tendencies. *The Guardian Angel* (1867) is a picture of rural New England. *A Mortal Antipathy* was written in 1885. It is scarcely a novel as the term is generally understood, but there is a thread of story on which the author hangs his observations, as he had done before in the Autocrat. The introduction to this book is autobiographical and historical, and gives a delightful view of Cambridge as it was in the author's boyhood, and a sadly amusing account of early American literature. The works before named appeared in the *Atlantic Monthly*, of which he was one of the founders. He wrote for it also many occasional essays and poems. Besides the early volume (1836), he published *Songs in Many Keys* (1862), *Songs of Many Seasons* (1875), *The Iron Gate* (1880), and *Before the Curfew* (1888). His other (prose) works are *Currents and Counter-currents* (1861), *Soundings from the Atlantic* (1864), *Border Lines of Knowledge* (1862), *Mechanism in Thought and Morals* (1871), and Memoirs of Motley (1879) and Emerson (1885). *Our Hundred Days in Europe* (1887) is an account of a visit made in 1886, during which he received honours from the universities of Cambridge, Oxford, and Edinburgh. The article EMERSON in this work is from his pen. Universally beloved, he died peacefully in his arm-chair in his library overlooking Cambridge, on the 7th October 1894.

It is difficult to make a summary of the traits of a writer so versatile. By his own generation he will be remembered as a great talker, in the highest sense. His intellect was keen and powerful; his observation instinctive; and his enthusiasm and energy would have carried through a man of less brilliant parts. His verse is melodious, compact, and rounded by art; its Gallic liveliness tempered by the even measure, and enforced by the point, of the 18th century. There is not in it a trace of the manner of recent English poets. Still, in its thought, its humanity, and its suggestions of science, it is seen that he is a man of his own century, and among the most advanced. Among specimens of his varied powers may be cited 'The Last Leaf,' already mentioned, 'The Chambered Nautilus,' 'Grandmother's Story' (of the battle of Bunker's Hill), 'Sun and Shadow,' 'For the Burns Centennial,' 'On lending a Punch-bowl,' and 'The One-hoss Shay.' He is especially happy in his tributes to brother poets as to Longfellow and Lowell, and to Whittier on his seventieth birthday. During the civil war he wrote many impassioned lyrics in defence of the Union—probably the best patriotic songs of the time. Of his prose it may be said that, whatever may be the subject, it always engages attention, and is always *sui generis*. The reader feels himself in contact with a strong mind, full of the fruit of reading, and with a character that is full of surprises. The choice of words is directed by a poet's inevitable instinct, and the general treatment is both precise and delicate. In the essay upon *Mechanism in Thought and Morals* there is an acuteness and subtlety which might have made a metaphysician; only that might have deprived the world of one of its most original and delightful essayists. There are degrees of value in his works, but it appears that his fame will rest chiefly upon The Autocrat, The Professor, and certain of his poems. Of his writings in general it should be said that, though his sparkling wit and flowing humour are evident to the most casual reader, a closer study reveals other qualities which give him a place among the great writers of the time.

The collected ('Riverside') edition of his works extends to 13 vols. (1891-92). There are Lives by W. S. Kennedy (1883), Emma E. Brown (1884), and J. T. Morse, jun. (2 vols. 1896).

Holofernes. See JUDITH.

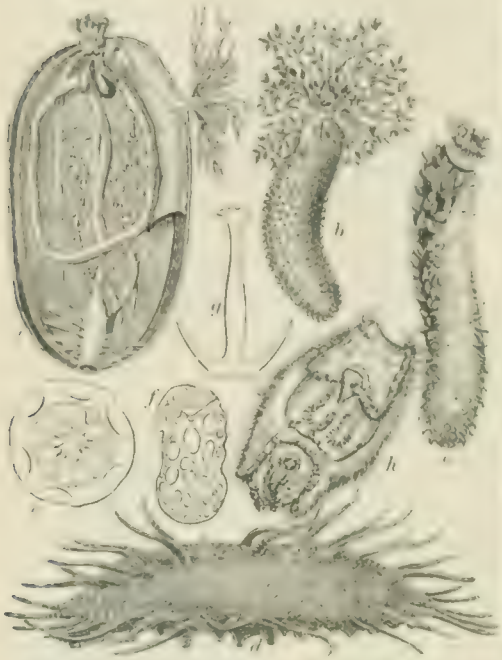
Holograph. See DEED.

Holoptychius (Gr. *holos*, 'all,' and *ptyche*, 'wrinkle'), an extinct genus of Ganoid fishes from Devonian and Carboniferous strata, type of a family the members of which are remarkable for their sculptured or wrinkled scales and extraordinary labyrinthine tooth structure.

Holothurians (*Holothurioidea*), a class of animals belonging to the sub-kingdom Echinodermata (q.v.), from the other members of which they are readily distinguished by a more or less worm-like appearance. They are popularly known as Sea-cucumbers or Sea-slugs. The word *holothourion* was used by Aristotle for a marine animal which we are now unable to identify, and the Latinised form was appropriated as a generic title by Linnæus in 1758. His genus was practically co-extensive with the present class. As in all Echinodermata, the symmetry of the adult body is apparently pentagonal, but, instead of presenting the appearance of rays diverging in one plane from a common centre, these are bands running along the sides of a cylinder. Very frequently they are not equidistant from each other, and then the radiate symmetry passes over into a bilateral one. The most common arrangement is for three rays to be approximated to each other on the ventral and two on the dorsal aspect. The body of a Holothurian consists of a sac of leathery consistency (whence the name Scytodermata sometimes used for them), made up of a cuticle, layers of cells, connective tissue, nerve-fibres, and calcareous plates and muscles. The calcareous plates are the sole remnants of the skeleton which is so largely developed in other Echinoderms. They are of various shapes, resembling wheels in Chirodota, plates and anchors in Synapta, and spines in some other genera; in Psolus there are overlapping scales. The mouth is ordinarily at one end of the body, but occasionally on the ventral surface; it is surrounded by a ring of tentacles whose number is some multiple of five, and opens into a gullet surrounded by a circle of calcareous plates. The digestive tract is ordinarily disposed in a loop; the last portion before the vent (cloaca) is a large space, which has been observed to contract rhythmically. To it are appended (except in two subdivisions) a pair of branched outgrowths, the respiratory trees, and certain processes of unknown function, known as the Cuvierian organs.

The gullet is surrounded by the ring-shaped central nervous system, and also by a tube belonging to the ambulacral or water-vascular system, which is so generally distributed among the Echinodermata. It gives off a branch forwards to each tentacle, and sends one backwards along each of the five radii of the body, to supply the tube-feet, the principal locomotor organs. The annular tube bears also a reservoir, the Polian vesicle, and communicates either with the body-cavity, or sometimes with the outside by means of a canal. The sense-

organs consist of auditory vesicles situated near the anterior end of the body, and containing small calcareous corpuscles (otoliths), and of the tentacles above mentioned. These may be either simple or



a, Semi-diagrammatic view of the viscera of a Holothurian, belonging to the Aspidochirotæ. Projecting from the upper end are the tentacles; lower down the calcareous ring, and still lower on the middle line the two Polian vesicles. The intestine is shown passing mid-loop to the hinder end of the body during part of its course. It is seen to be attached to the body wall by a mesentery. Two respiratory trees open into the expanded termination or cloaca, which is connected to the walls of the body by radiating muscular bands. Longitudinal muscles pass from the anterior to the posterior end of the animal. To the right is the branched genital gland with its duct. (From Leuns.)

b, [illegible], one of the Dendrochirotæ, ¼ nat. size (from Lemoine); *c*, *H. Thomsoni*, Gosse, one of the Aspidochirotæ, ⅓ nat. size (from Lemoine); *d*, [illegible], one of the Elasipoda, ½ nat. size (from Theel); *e*, adolescent echinoplutei, from the enlargement of [illegible], magnified ten diameters (from Thorell); *f*, pluteus and auricle of *Synapta inhærens*, highly magnified (from Thorell); *g*, larval form (Auricularia) of *H. tubulosa* (Gmel.), highly magnified (from Selenka)

branched, and in a few cases they are furnished with suckers. In the Elasipoda tactile organs are present in the form of dorsal papillæ.

The generative organs consist of a bunch of tubes, with one end closed; their duct opens either within or just outside the circle of tentacles. The egg develops as a rule into a curiously formed bilaterally symmetrical larva, formerly described as a distinct animal under the name Auricularia. In a few cases the development is direct; in *Cucumaria crocea* the young are borne among the tentacles of the parent, whilst in *Psolus ephippifer* they are carried in a special pouch on the back.

The class is subdivided as follows:

I. Elasipoda, pelagic deep-sea forms, bilaterally symmetrical, tube-feet on the ventral surface, papillæ on the dorsal. No respiratory trees. A very large number of genera and species have been obtained by the *Challenger* and other deep-sea expeditions.

II. Pedata, with tube-feet and tentacles, but no papillæ.

(1) Aspidochirotæ, with tentacles bearing a disc, and ten calcareous plates round the gullet. The genus Holothuria as now understood belongs here.

(2) Dendrochirotæ, with arborescent tentacles [illegible]

III. Apoda, devoid of tube-feet and papillæ.

(1) Pneumophora, with respiratory trees, e.g. Molpadia. (2) Apneumona, with neither radial water-vascular canals, respiratory trees, nor Cuvierian [illegible], e.g. Synapta, Chiridota.

The Holothurians are all marine, and have a world-wide distribution; traces of them have been found fossil as far back as the Carboniferous deposits of Scotland. They either take in large quantities of sand and absorb the nutritive matters mixed with it, or devour small animals. On strong contraction, caused by sudden irritation, the whole digestive canal and its appendages are not unfrequently ejected; but these are regenerated after a time. In some species the cloaca is inhabited by a small parasitic fish of the genus Fierasfer. Trepang (q.v.), or *bêche-de-mer*, a great delicacy among the Chinese, consists of dried Holothurians.

Holstein, formerly a duchy belonging to Denmark, and at the same time a member of the Germanic Confederation, was annexed in 1866 to Prussia, which incorporated it in the province of Sleswick Holstein. It is separated from Sleswick on the N. by the river Eider and the North Baltic Canal; is bounded on the E. by the Baltic Sea, the territory of Lübeck, and the duchy of Lauenburg; on the S. by the Hamburg territory and the Elbe; and on the W. by the North Sea. One-eighth of the surface consists of marshes. The central districts are occupied by an undulating plain traversed from north to south by a low heathy and sandy ridge. The soil, with the exception of several tracts of sand and heath, is very fruitful, especially in the marshes. The climate and natural productions closely resemble those of similar districts in the north of Germany. Salt and gypsum are the only minerals found. Peat is plentiful. Agriculture and the rearing of cattle are the chief employments, though market-gardening flourishes in the neighbourhood of Altona and Hamburg, and shipping in the seaport towns, and fishing along the coasts, especially for oysters in the North Sea. Area, 3237 sq. m.; pop. about 560,000 mostly Germans of the Low German stock. The history of Holstein will be noticed under SLESWICK.

Holsten, KARL CHRISTIAN JOHANN, an eminent Protestant theologian, born at Güstrow in Mecklenburg-Schwerin, 31st March 1825. He studied theology and philology at Leipzig, Berlin, and Rostock, and became in 1852 a teacher at the Rostock gymnasium. In 1870 he was called to the Bern High School as an extra-ordinary professor, next year became ordinary professor, and in 1876 obeyed a call to a similar post at Heidelberg. His startling contribution to Pauline theology, *Zum Evangelium des Paulus und Petrus* (1867), was followed by *Das Evangelium des Paulus* (vol. i. 1880), *Die drei ursprünglichen, noch ungeschriebenen Evangelien* (1885), and *Die Synoptischen Evangelien nach der Form ihres Inhalts* (1886). He died 27th Jan. 1897.

Holt, SIR JOHN, Lord Chief justice of the Court of King's Bench, was born at Thame in Oxfordshire, on 30th December 1642. After leading a wild life as a student of Oriel College, Oxford, he entered at Gray's Inn, reformed his manners, and was called to the bar in 1663. He figured as counsel in most of the state-trials of that period, and generally as pleader for the defendants. In 1686 he was made recorder of London and king's serjeant, and was knighted. On the accession of William III. he was raised to the dignity of lord chief-justice of the King's Bench, and filled the post to his life's end. He died 3d March 1710. Sir John Holt occupies an honourable place among the dignitaries of the English bench on two accounts. Contrary to the practice of his predecessors, he treated those who appeared before him with uniform fairness and justice. Although politically a Whig, Holt's judi-

cial career was entirely free from the stigma of party bias or intrigue. He distinguished himself by his courageous defence of the powers of his office against both crown and parliament, and his decisions were marked by conspicuous ability and unbending integrity. See *Life* (1764) and *Reports of Cases determined by Sir John Holt from 1688 to 1710* (1738).

Holtzendorff, Franz von, a German writer on law subjects, was born 14th October 1829, at Vietmannsdorf in Brandenburg. Educated for the law, he practised in the courts at Berlin till 1857, when he became a lecturer on law at the university. Made professor there in 1861, he was in 1873 called to Munich. He is known as an author on several branches of law, and especially as an advocate for the reform of prisons and penal systems. Among his numerous works may be mentioned one on deportation, and another on the Irish prison system (1859); *Die Prinzipien der Politik* (1869); *Encyclopädie der Rechtswissenschaft* (1870-71; 4th ed. 1882); *Handbuch des Deutschen Strafrechts* (1871-77); and *Handbuch des Völkerrechts* (1885).

Holtzmann, Adolf, a celebrated Germanist, was born at Carlsruhe, 2d May 1810, first studied theology at Berlin, then Old German philology under Schmeller at Munich, and next Sanskrit under Burnouf at Paris. In 1852 he was appointed professor of the German Language and Literature at Heidelberg, where he died, 3d July 1870. Among his numerous contributions to philology are *Ueber den griech. Ursprung des Ind. Tierkreises* (1844); *Ind. Sagen* (1845-47); *Kelten und Germanen* (1855), in which both are maintained to have been originally identical; and *Untersuchungen über das Nibelungenlied* (1854), in which the views of Lachmann are assailed. His last work was a projected *Altdeutsche Grammatik*. After his death Holder edited from his papers *German. Altertumer* (1873), *Deutsche Mythologie* (1874), and *Die ältere Edda* (1875). - Of his brothers two attained eminence, Karl Heinrich Alexander (1811-65) as a lecturer and writer on applied mathematics; and Karl Julius (1804-77) as a preacher and ecclesiastic at Carlsruhe.

Holtzmann, Heinrich Julius, an eminent theologian, was son of the Germanist Adolf Holtzmann. He was born at Carlsruhe, 17th May 1832, became in 1861 extra-ordinary, in 1865 ordinary professor of Theology at Heidelberg, and obeyed in 1874 a call to the theological faculty at Strasburg. Holtzmann set out as an exponent of the 'Vermittelungtheologie,' but gradually let slip its assumptions, and now stands one of the chief representatives of the more advanced modern school.

Among his writings are *Kanon und Tradition* (1859), *Die Synoptischen Evangelien* (1863), *Kritik der Epheser- und Kolosserbriefe* (1872), *Die Pastoralbriefe* (1880), and an introduction to the New Testament (1885). Besides these he prepared the New Testament portion of Bunsen's *Bibelwerk*; published two volumes of sermons (1865 and 1873); along with G. Weber, *Geschichte des Volkes Israel* (1867); and with Zopffel, the *Lexikon für Theologie und Kirchenwesen* (1882). He has also contributed extensively to the theological reviews.

Holy Alliance, a league formed (1816) after the fall of Napoleon by the sovereigns of Russia, Austria, and Prussia, whereby they pledged themselves to rule their peoples like fathers of families, and to regulate all national and international relations in accordance with the principles of Christian charity. But the alliance was made in actual fact a means of mutual encouragement in the maintenance of royal and imperial absolutism, and an instrument for suppressing free institutions and checking the aspirations for political liberty struggling into realisation amongst the nations of the Continent. The league died a natural death after the lapse of a few years.

Holy Coat of Treves. See Treves.

Holy Ghost. See Spirit, Creeds.

Holy Grail. See Grail.

Holy Grass (*Hierochloe borealis*), a sweet-smelling grass belonging to the tribe Phalarideæ, about a foot high, with a brownish glossy lax panicle. It is sometimes strewed on the floors of churches on festival-days, whence its name.

Holyhead, a seaport (once a parliamentary borough) of Anglesey, North Wales, is situated on a small island of the same name, 60 miles E. of Dublin, 85 W. of Chester, and 264 NW. of London. Although recently much improved, it is still a primitive, irregularly-built town. It is the terminus of the London and North-Western Railway (1850), and the port for the mail steam-packets to Dublin, which perform the voyage in about four hours. The shipping accommodation consists of a harbour with two divisions, and a roadstead sheltered by a breakwater. The harbour was extended in 1873-80, and the quay lengthened to 4000 feet. The roadstead or harbour of refuge (1847-73), with an area of about 400 acres, is protected from the sea on the north by a solid masonry wall, rising 38 feet 9 inches above low-water mark, and backed by a strong rubble mound (see Breakwater, Vol. II. p. 413). Pop. (1875) 5622; (1891) 8726, employed in the coasting trade and in shipbuilding and rope-making. Till 1885 Holyhead united with Amlwch, Beaumaris, and Llangefni in sending one member to parliament.

Holyhead Island, lying west and forming part of Anglesey, is 8 miles long by 3½ broad. Area, 9658 sq. acres; pop. (1891) 9616. The island is separated from Anglesey by a narrow sandy strait, crossed by a causeway, along which run the Holyhead road and the Chester and Holyhead Railway, and arched in the centre for the tide to pass beneath. The surface is for the most part rocky and barren. On the north-west coast are two islets, the North and South Stacks, the latter with a lighthouse, whose light, 197 feet above high-water, is seen for 20 miles. The Stacks and the north coast are hollowed out into magnificent caves, the haunt of sea-fowl.

Holy Island, or Lindisfarne, a small island of Northumberland, 9½ miles SE. of Berwick-on-Tweed. It is 3 miles long by 1½ broad, and has an area of 2457 acres. At low-water it can be reached by walking across the sands, a distance of 3½ miles; at high-water the strait covered by the sea is 1½ mile wide. The village (pop. 686) is guarded by the castle, built about 1500, and still in good repair. The island is chiefly interesting for the ruins of its Benedictine priory church. This was built in 1093 out of the materials of the ancient cathedral, erected here in the 7th century, under the auspices of Bishop Aidan. Here a company of Columban monks established themselves, and grew into the famous priory of Lindisfarne, the luminary of the north, the Iona of England. It reached its greatest glory under St Cuthbert (q.v.). The cathedral suffered severely from the ravages of the Danes, and was gradually allowed to fall into ruins as Durham grew into importance. In August 1887 three thousand barefooted pilgrims crossed the sands to Lindisfarne. See works by G. Johnston (1853) and F. R. Wilson (1870).

Holy Land. See Palestine.

Holyoake, George Jacob, a zealous labourer for bettering the condition of working-men, a writer on co-operation, and the founder of 'Secularism, a system which bases duty on considerations purely human, relies on material means of improvement, and justifies its beliefs to the conscience, irrespective of atheism, theism, or revelation.' He was born at Birmingham on 13th April 1817. During the

course of his life he has filled various offices and taken an active share in various public movements. He taught mathematics at the Mechanics Institution in Birmingham, lectured on Robert Owen's socialist system, acted as secretary to the British contingent that went to the assistance of Garibaldi, edited the *Reasoner*, was chiefly instrumental in getting the bill legalising secular affirmations passed, projected the light on the clock tower of the Parliament House, and exerted himself on behalf of settlers in Canada and the United States, services recognised by Mr Gladstone and the Canadian government. Holyoake was the last person imprisoned in England on a charge of atheism (1841). He was president of the Carlisle Congress of the Co-operative Societies, 1887. On the subject of co-operation he has written *History of Co-operation in Rochdale* (2 parts, 1857-72), *History of Co-operation in England* (2 vols. 1875-79; new ed. vol. i. 1886), and *Self-help a Hundred Years Ago* (1888). Other works from his pen are *The Limits of Atheism* (1861), *Trial of Theism* (1877), *Life of Joseph Rayner Stephens* (1881), *Hostile and Grotesque Toleration*, a *History of Middlesborough*, *Sixty Years of an Agitator's Life* (1892), &c.

Holyoke, a city of Massachusetts, 8 miles N. of Springfield, on the Connecticut River, which is here crossed by a dam over 1000 feet long and falls 60 feet in less than a mile, supplying immense water power. Holyoke is a great seat of the paper-making trade, and has a score of paper-mills, besides numerous cotton-factories and woollen-mills, several grist-mills, and manufactures of metal and wooden wares. It contains a fine city-hall of granite, and a large number of excellent schools. Pop. (1870) 10,733; (1890) 35,637.

Holy Roman Empire. See ROMAN EMPIRE, CHURCH HISTORY.

Holyrood, an abbey and palace of Edinburgh. In the year 1128 King David I. of Scotland founded at Edinburgh an abbey of canons regular, of the order of St Augustine. According to the legend, it was founded on the spot where the king, whilst hunting on Rood Day in the fourth year of his reign, in the forest that then surrounded Edinburgh, was thrown from his horse and nearly gored by a hart, and was only saved by a mysterious hand putting a flaming cross between him and the animal, at the sight of which the hart fled away, leaving the king safe. The abbey was dedicated to the Holy Cross or Rood, a casket of gold, elaborately wrought and shaped like a cross, which was brought to Scotland by Margaret, wife of Malcolm, king of Scotland, about 1070. This casket was held in great veneration as containing a splinter of the true Cross, and became one of the heirlooms of the kingdom. The Black Rood of Scotland, as it was called, was carried before the army of David II. when he invaded England in 1346, and fell into the hands of the English at the battle of Neville's Cross. The victors placed it in the shrine of St Cuthbert in the cathedral of Durham. At the time of the Reformation it disappeared, and nothing has been known about it since. The abbey church was built in the Norman and early Gothic styles. The abbey was several times burned by the English, especially in 1544 (when the transepts were destroyed) and 1547. At the Reformation the monastery was dissolved; and the abbey church having been repaired was henceforth used as the parish church of the Canongate. In 1687 James VII., having built another parish church for the Canongate, converted the abbey church into the chapel royal of Holyrood. It was plundered and burned by the mob at the Revolution in 1688, and remained in neglect until 1758. In that year it was repaired and roofed; but the roof was too heavy for the walls, and it fell in 1768. Since then the chapel has been left in a state of ruin. The vault, built as a burying-place for the royal family of Scotland, contained the ashes of David II., James II., James V., and of many other royal and historical personages, such as the Duke of Albany, Lord Darnley, &c.

The abbey of Holyrood early became the occasional abode of the Scottish kings. Robert Bruce and Edward Baliol held parliaments within its walls. James II. was born in it, crowned in it, married in it, buried in it. The foundations of the palace, apart from the abbey, were laid about 1501 by James IV., who made Edinburgh the capital of Scotland. Henceforth Holyrood Palace was the chief seat of the Scottish sovereigns. It was mostly destroyed by the English in 1544, but immediately afterwards rebuilt on a larger scale. Queen Mary took up her abode in the palace when she returned from France in 1561. Here, in 1566, Rizzio was torn from her side and murdered. It was garrisoned after the battle of Dunbar in 1650 by Cromwell's troops, who burned the greater part of it to the ground. It was rebuilt by Charles II., from the designs of Sir William Bruce of Kinross, between 1671 and 1679. After the accession of James VI. to the throne of England it ceased to be occupied as a permanent royal residence. But George IV. held his court in it in 1822, and Queen Victoria occasionally spends a night within its walls. At the present day the disposition of the rooms in the older portion seems to be much the same as in the time of Queen Mary. The picture-gallery, containing badly-painted 'portraits' of fabulous Scottish kings, and a few genuine works of art, possesses romantic interest as the scene of the balls and receptions of Prince Charlie in 1745.

The palace, with its precincts and park, was in Catholic times a sanctuary for all kinds of offenders, but afterwards the privilege of Sanctuary (q.v.) was extended to none except insolvent debtors. De Quincey is the most illustrious person who availed himself of the privilege. But now, from recent ameliorations in the laws affecting debtors, especially the Debtors (Scotland) Act, 1880, the protection has no longer legal validity. See *Historical Description of the Monastery and Chapel Royal of Holyrood House* (1819), and D. Wilson, *Memorials of Edinburgh* (1848).

Holy Sepulchre, KNIGHTS OF THE, an order of knighthood instituted, probably by Pope Alexander VI., for the guardianship of the Holy Sepulchre, and the relief and protection of pilgrims. On the recapture of Jerusalem by the Turks the knights retired to Italy, and settled at Perugia. For a time united with the Hospitallers, the order was reconstituted (1814) in France and in Poland.

Holy Spirit. See SPIRIT.

Holy Water, in the Roman Catholic, as also in the Greek, Russian, and oriental churches, signifies water blessed by a priest or bishop for certain religious uses. Water is, almost of its own nature, a fitting symbol of purity; and accordingly, in most of the ancient religions, the use of lustral or purifying water not only formed part of the public worship, but also entered largely into the personal acts of sanctification prescribed to individuals. The Jewish law contained many provisions to the same effect; and our Lord, by establishing baptism with water as the necessary form of initiation into the religion instituted by him, gave his sanction to the use. The usage of sprinkling the hands and face with water before entering the sanctuary, prescribed in the Jewish law for those ceremonially unclean, was very early adopted in the Christian church. It is expressly mentioned by

Tertullian in the end of the 2d century. And that the water so employed was blessed by the priests we learn from St Jerome, among others, and from the Apostolical Constitutions. Although it is difficult to fix the precise time, it cannot be doubted that the practice of mingling salt with the water is of very ancient origin. In the Western Church there is a solemn blessing of water in the service of Holy Saturday, but the ceremonial is repeated by the priest whenever necessary. Holy water is placed in Benitiers (q.v.) at the doors of churches that worshippers may sprinkle themselves with it; before high mass on Sundays the celebrant sprinkles the people with holy water; and it is used in nearly every blessing given by the church. Instructed Catholics regard the use of holy water chiefly as a means of suggesting to the mind the necessity of internal purity; and although it is supposed to derive from the blessing a special efficacy for this end, yet this efficacy is held to be mainly subjective and of a character entirely distinct from that ascribed to the sacramental rites of the church. See BENEDICTION.

Holy Week, the week immediately preceding Easter, and specially consecrated to the commemoration of the Passion of our Redeemer. This institution is of very early origin, and the name Holy Week is but one of many by which its sacred character has been described. In English use it is called 'Passion Week' (a name appropriated, in Roman use, to the week before Palm Sunday). It was also called the 'Great Week,' the 'Silent Week,' the 'Week of the Holy Passion,' the 'Vacant Week,' the 'Penitential Week.' In the Roman Catholic Church the special characteristics of the celebration of the Holy Week are increased solemnity and gloom, penitential rigour, and mourning. If any of the ordinary church festivals fall therein, it is deferred till after Easter. All instrumental music is suspended in the churches, the altars are stripped of their ornaments, the pictures and images are veiled from public sight; manual labour, although it is no longer entirely prohibited, is by many persons voluntarily suspended; the rigour of fasting is redoubled, and alms-deeds and other works of mercy sedulously enjoined and practised. All church services of the week, moreover, breathe the spirit of mourning, some of them being specially devoted to the commemoration of particular scenes in the Passion of our Lord. The days thus specially solemnised are Palm Sunday, Spy Wednesday, Holy (or Maundy, q.v.) Thursday, Good Friday (q.v.), Holy Saturday. Holy Thursday in the Roman Catholic Church is specially designed as a commemoration of the Last Supper, and of the institution of the eucharist, although there are several other features peculiar to the day. To Holy Saturday belongs the solemn blessing of fire and of the water of the baptismal font; and from the earliest times it was set apart for the baptism of catechumens, and for the ordination of candidates for the ecclesiastical ministry. From the 'new fire,' struck from a flint, and solemnly blessed on this day, is lighted the Paschal Light, which is regarded as a symbol of Christ risen from the dead. This symbolical light is kept burning during the reading of the gospel at mass throughout the interval between Easter and Pentecost. It must be added, however, that in many instances the primitive institution of the Holy Week was perverted, and that the suspension of labour, designed for purposes of devotion, was turned into an occasion of amusement not infrequently of a very questionable character. Such abuses are now universally discountenanced by the ecclesiastical authorities. See FASTS, FESTIVALS; and Feasey's *Ancient English Holy Week Ceremonial* (1897).

Holywell (Welsh *Treffynnon*), a parliamentary borough and market-town of Flintshire, North Wales, on an eminence 15 miles NW. of Chester. It is the seat of numerous lead, iron, copper, and zinc mines, and has smelting-works for the extraction of these metals, manufactures of paper, flannel, and Roman cement, and tanyards and breweries. The borough unites with those of Flint, Mold, &c. in returning one member to parliament. Pop. (1881) 3090; (1891) 3018. Holywell owes its origin to the renowned well of St Winifred, which, until diminished by drainage works, was estimated to deliver 4700 gallons of water per minute. The Perpendicular chapel over the well is attributed to Margaret, mother of Henry VII. It is still a place of pilgrimage for Roman Catholics. See Pennant's *History of Holywell* (1796).

Homage (Old Fr.; Low Lat. *homaticum*; Lat. *homo*, 'man') is the service due from a knight or vassal to his lord in feudal times, the vassal professing to become his lord's man. See FEUDALISM.

Homburg, or HOMBURG VOR DER HÖHE, a town in the Prussian province of Hesse-Nassau, is situated at the foot of the Taunus Mountains, 8 miles NNW. of Frankfort-on-the-Main. It has beautiful environs, and is frequented by about 12,000 visitors annually on account of its mineral waters. The springs, five in number, possess saline and chalybeate properties. They are considered effective in cases of disordered liver and stomach, for hæmorrhoidal and menstrual disorders, and for gout, rheumatism, scrofula, and skin diseases. About 400,000 bottles are sent away annually. The gaming-tables were suppressed in 1872. Pop. (1875) 8294; (1895) 9274. See works by Schick (14th ed. 1885) and Will (1880).

Home, the name of one of the oldest and most celebrated of the historic families of Scotland. After the Conquest Cospatrick, the great Earl of Northumberland, took refuge in Scotland, and received from Malcolm Canmore the manor of Dunbar, and large estates in the Merse and the Lothians. Patrick, the second son of the third Earl of Dunbar, inherited from his father the manor of Greenlaw, and having married his cousin, daughter of the fifth earl, obtained with her the lands of Home, from which his descendants took their designation. After the overthrow of the earls of Dunbar and March in 1436 the Homes succeeded to a portion of their vast estates and to a great deal of their power on the eastern Marches. Sir Alexander Home was created a peer by James III.; but, disappointed in his attempt to appropriate the revenues of Coldingham Priory, he joined the disaffected nobles who rebelled against James, and took part in the battle of Sauchieburn, where the king was killed. The second baron obtained estates and important offices from James IV. Along with Lord Huntly he commanded the vanguard of the Scottish army at Flodden, and routed the English right wing. He was almost the only Scottish noble who returned unhurt from that battle. He was induced by fair promises from the Regent Albany to visit Holyrood along with his brother William in 1516, and they were arrested, tried for treason, and condemned and executed. The forfeited title and estates were restored to his brother George in 1522; but, though the family took a prominent part in public affairs during the troublous times of Queen Mary and the great civil war, they never regained their former influence. Their extensive estates dwindled down to a patrimony of 2000 acres, and they sank into insignificance. But the marriage (1832) of the eleventh earl to the heiress of the Douglas estates restored the decayed fortunes of this ancient house. These estates now,

according to the Doomsday Book, yield a rental of £47,721 a year.

Home, DANIEL DUNGLAS, spiritualist, was born near Edinburgh, March 20, 1833, and was taken by an aunt to the United States, where by 1850 he had become a famous medium. He began the study of medicine, but was persuaded by his friends to practise spiritualism instead; and in 1855 he removed to London to carry on his 'mission.' Home was a proficient in mesmerism and such like sciences, and to table-turning and spirit-rapping he added, for advanced disciples, speaking ghosts, and a display of his own powers of floating in the air. He made many converts, though not all the great people he claimed. He was presented at several courts, and to the pope; and he joined the Roman Catholic Church, but was ultimately expelled for spiritualistic practices. In 1866 he acceded to a Mrs Lyon's suggestion that he should become her adopted son, she assigning to him £60,000; but this money his fickle patroness afterwards compelled him to restore, and the lawsuit discredited Home greatly, though he was scarcely to blame in the matter. He died at Auteuil, 21st June 1886. He published two series of *Incidents of my Life* (1863 and 1872), and *Lights and Shadows of Spiritualism* (1877); see also *D. D. Home: his Life and Mission* (1888), and a continuation, *The Gift of D. D. Home* (1890), both by his widow.

Home, HENRY. See KAMES (LORD).

Home, JOHN, a Scotch clergyman and dramatist, was born at Leith in 1722. He graduated at the Edinburgh University in 1742, and three years later entered the church. He was present as a volunteer on the king's side when the royalists were routed by the young Pretender at Falkirk, and was carried a prisoner to the castle of Doune, whence he effected his escape. In 1747 he was appointed minister of Athelstaneford, near Haddington, where he produced in 1747 the tragedy of *Agis*, and, after the lapse of five years, *Douglas*, a tragedy founded (before the publication of Percy's *Reliques*) on the ballad of Gil Morrice. Each of these plays was successively rejected by Garrick; but *Douglas*, brought out at Edinburgh, met with instant and brilliant success, and evoked equal enthusiasm when placed on the London boards. Its production, however, gave such offence to the Presbytery that the author thought fit to resign his ministry, and, withdrawing into England, he became private secretary to the Earl of Bute, who procured him a pension of £300 a year. The success of *Douglas* induced Garrick not only to accept Home's next play, *The Siege of Aquileia*, but to bring out the earlier work, *Agis*. Home's other works are *The Fatal Discovery*, *Alonzo*, *Alfred*, occasional poems, and, in prose, *A History of the Rebellion of 1745*. He died in 1808.

Home is the last of our tragic poets whose works for any time held the stage. The drama, purified from the licentiousness of Wycherley and Congreve, had become frigid and lifeless in the hands of Addison, Rowe, and Johnson, and the enthusiasm with which *Douglas* was greeted was due to the generous warmth of domestic feeling, the chivalrous ardour and natural pathos which Home infused into his work. His writings are remarkable for the interesting character of their plots, for lucidity of language, and for occasional flashes of genuine poetry; but he did not succeed in entirely discarding the pompous declamation of his forerunners. In his day he enjoyed the praise of all and the friendship of the most distinguished; Collins dedicated to him his ode on the Highland superstitions, and Burns, with more zeal than judgment, said that he

> [illegible]

The taste of the time is not that of ours, but the dramatists who displaced him turned to comedy, and he has had no successor of equal fame. See the Life by Henry Mackenzie, prefixed to his works (3 vols. 1822).

Home Counties, the counties over and into which London has extended—Middlesex, Hertfordshire, Essex, Kent, Surrey. The south-eastern circuit (see ASSIZE) is still sometimes called the 'Home Circuit,' though it includes, besides the home counties (except Middlesex), also Cambridgeshire, Norfolk, and Suffolk.

Homer. The poems of Homer differ from all other known poetry in this that they constitute in themselves an encyclopædia of life and knowledge; at a time when knowledge, indeed, such as lies beyond the bounds of actual experience was extremely limited, but when life was singularly fresh, vivid, and expansive. The only poems of Homer we possess are the *Iliad* and the *Odyssey*, for the Homeric *Hymns* and other productions lose all title to stand in line with these wonderful works, by reason of conflict in a multitude of particulars with the witness of the text, as well as of their poetical inferiority. They evidently belong to the period that follows the great migration into Asia Minor brought about by the Dorian conquest.

The *dictum* of Herodotus which places the date of Homer 400 years before his own, therefore in the 9th century B.C., was little better than mere conjecture. Common opinion has certainly presumed him to be posterior to the Dorian conquest. The Hymn to Apollo, however, which was the main prop of this opinion, is assuredly not his. In a work which attempts to turn recent discovery to account, I have contended that the fall of Troy cannot properly be brought lower than about 1250 B.C., and that Homer may probably have lived within fifty years of it (*Homeric Synchronism*, I. vi.).

The entire presentation of life and character in the two poems is distinct from, and manifestly anterior to, anything made known to us in Greece under and after that conquest. The study of Homer has been darkened and enfeebled by thrusting backwards into it a vast mass of matter, belonging to these later periods, and even to the Roman civilisation, which was different in spirit and which entirely lost sight of the true position of Greeks and Trojans, and inverted their moral as well as their martial relations. The name of Greeks is a Roman name: the people, to whom Homer has given immortal fame, are Achaians both in designation and in manners. The poet paints them at a time when the spirit of national life was rising within their borders. Its first efforts had been seen in the expeditions of Achaian natives to conquer the Asiatic or Egyptian immigrants who had under the name of Caduneians (etymologically, 'foreigners') founded Thebes in Bœotia, and in the voyage of the ship *Argo* to Colchis—which was probably the seat of a colony sprung from the Egyptian empire, and was therefore regarded as hostile in memory of the antecedent aggressions of that empire. The expedition against Troy was the beginning of the long chain of conflicts between Europe and Asia which end with the Turkish conquests, and with the reaction of the last 300 years, and especially of the 19th century, against them. It represents an effort truly enormous towards attaining nationality in idea and in practice. Clearing away obstructions, of which the cause has been partially indicated, we must next observe that the text of Homer was never studied by the moderns as a whole in a searching manner until within the last two generations. From the time of Wolf there

was infinite controversy about the works and the authorship with little positive result, except the establishment of the fact that they were not written but handed down by memory—an operation aided and methodised by the high position of bards as such in Greece (more properly Achaiis, and afterwards Hellas), by the formation of a separate school to hand down these particular songs, and by the great institution of the Games at a variety of points in the country. At these centres there were public recitations even before the poems were composed, and the uncertainties of individual memory were limited and corrected by competition carried on in presence of a people eminently endowed with the literary faculty, and by the vast national importance of handing down faithfully a record which was the chief authority touching the religion, history, political divisions, and manners of the country. Many diversities of text arose, but there was thus in continual operation a corrective as well as a disintegrating process.

The Germans, who had long been occupied in framing careful monographs which contracted the contents of the Homeric text on many particulars, such as the Ship, the House, and so forth, have at length supplied, in the work of Dr E. Buchholz, a full and methodical account of the contents of the text. This work would fill in English not less than six octavo volumes.

The Greeks called the poet *poiētēs*, the 'maker,' and never was there such a maker as Homer. The work, not exclusively but yet pre-eminently his, was the making of a language, a religion, and a nation. The last named of these was his dominant idea, and to it all his methods may be referred. Of the first he may have been little conscious while he wrought in his office as a bard, which was to give delight.

Careful observation of the text exhibits three powerful factors which contribute to the composition of the nation. First, the Pelasgic name is associated with the mass of the people, cultivators of the soil in the Greek peninsula and elsewhere, though not as their uniform designation, for in Crete (for example) they appear in conjunction with Achaians and Dorians, representatives of a higher stock, and with Eteocretans, who were probably anterior occupants. This Pelasgian name commands the sympathy of the poet and his laudatory epithets; but is nowhere used for the higher class or for the entire nation. The other factors take the command. The Achaians are properly the ruling class, and justify their station by their capacity. But there is a third factor also of great power. We know from the Egyptian monuments that Greece had been within the sway of that primitive empire, and that the Phœnicians were its maritime arm, as they were also the universal and apparently exclusive navigators of the Mediterranean. Whatever came oversea to the Achaian land came in connection with the Phœnician name, which was used by Homer in a manner analogous to the use of the word Frank in the Levant during modern times. But as Egyptian and Assyrian knowledge is gradually opened up to us we find by degrees that Phœnicia conveyed to Greece Egyptian and Assyrian elements together with her own.

The rich materials of the Greek civilisation can almost all be traced to this medium of conveyance from the East and South. Great families which stand in this association were founded in Greece and left their mark upon the country. It is probable that they may have exercised in the first instance a power delegated from Egypt, which they retained after her influence had passed away. Building, metal-working, navigation, ornamental arts, natural knowledge, all carry the Phœnician impress. This is the third of the great factors which were combined and evolved in the wonderful nationality of Greece, a power as vividly felt at this hour as it was three thousand years ago. But if Phœnicia conveyed the seed, the soil was Achaian, and on account of its richness that peninsula surpassed, in its developments of human nature and action, the southern and eastern growths. An Achaian civilisation was the result, full of freshness and power; in which usage had a great sacredness, religion was a moral spring of no mean force, slavery though it existed was not associated with cruelty, the worst extremes of sin had no place in the life of the people, liberty had an informal but very real place in public institutions, and manners reached to much refinement: while on the other hand fierce passion was not abated by conventional restraints, slaughter and bondage were the usual results of war, the idea of property was but very partially defined; and, though there were strong indeterminate sentiments of right, there is no word in Homer signifying law. Upon the whole, though a very imperfect, it was a wonderful and noble nursery of manhood.

It seems clear that this first civilisation of the peninsula was sadly devastated by the rude hands of the Dorian conquest. Institutions like those of Lycurgus could not have been grafted upon the Homeric manners; and centuries elapsed before there emerged from the political ruin a state of things favourable to refinement and to progress in the Greece of history; which, though in so many respects of an unequalled splendour, yet had a less firm hold than the Achaian time upon some of the highest social and moral ideas. For example, the position of women had greatly declined, liberty was perhaps less largely conceived, and the tie between religion and morality was more evidently sundered.

After this sketch of the national existence which Homer described, and to the consolidation of which he powerfully ministered, let us revert to the state in which he found and left the elements of a national religion. A close observation of the poems pretty clearly shows us that the three races which combined to form the nation had each of them their distinct religious traditions. It is also plain enough that with this diversity there had been antagonism. As sources illustrative of these propositions, which lie at the base of all true comprehension of the religion—which may be called Olympian from its central seat—I will point to the numerous signs of a system of Nature-worship as prevailing among the Pelasgian masses; to the alliance in the War between the Nature-powers and the Trojans as against the loftier Hellenic mythology; to the legend in *Iliad*, i. 396–412, of the great war in heaven, which symbolically describes the collision on earth between the ideas which were locally older and those beginning to surmount them; and, finally, to the traditions extraneous to the poems of competitions between different deities for the local allegiance of the people at different spots, such as Corinth, to which Phœnician influence had brought the Poseidon-worship before Homer's time, and Athens, which somewhat later became peculiarly the seat of mixed races. I have spoken of Nature-worship as the Pelasgian contribution to the composite Olympian religion. In the Phœnician share we find, as might be expected, both Assyrian and Egyptian elements. The best indication we possess of the Hellenic function is that given by the remarkable prayer of Achilles to Zeus in *Iliad*, xvi. 233–248. This prayer on the [illegible] of Patroclos is the hinge of the whole action of the poem, and is preceded by a long [illegible] (220–232) such as we nowhere else find. The [illegible] appears in it; and the immediate servants of Zeus [illegible]

several indications it may be gathered that the Hellenic system was less priestly than the Troic. It seems to have been an especial office of Homer to harmonise and combine these diverse elements, and his Thearchy is as remarkable a work of art as the terrestrial machinery of the poem. He has profoundly impressed upon it the human likeness often called anthropomorphic, and which supplied the basis of Greek art. He has repelled on all sides from his classical and central system the cult of nature and of animals; but it is probable that they kept their place in the local worships of the country. His Zeus is to a considerable extent a monarch, while Poseidon and several other deities bear evident marks of having had no superior at earlier epochs or in the countries of their origin. He arranges them partly as a family, partly as a commonwealth. The gods properly Olympian correspond with the Boulē or council upon earth; while the orders of less exalted spirits are only summoned on great occasions. He indicates twenty as the number of Olympian gods proper, following in this the Assyrian idea. But they were far from holding an equal place in his estimation. For a deity such as Aphroditē brought from the East, and intensely tainted with sensual passions, he indicates aversion and contempt. But for Apollo, whose cardinal idea is that of obedience to Zeus, and for Athēnē, who represents a profound working wisdom that never fails of its end, he has a deep reverence. He assorts and distributes religious traditions with reference to the great ends he had to pursue; carefully, for example, separating Apollo from the sun, with which he bears marks of having been in other systems identified. Of his other greater gods it may be said that the dominant idea is in Zeus policy, in Hērē nationality, and in Poseidon physical force. His Trinity, which is conventional, and his Under-world appear to be borrowed from Assyria, and in some degree from Egypt. One licentious legend appears in Olympos, but this belongs to the *Odyssey*, and to a Phœnician, not a Hellenic circle of ideas. His Olympian assembly is, indeed, largely representative of human appetites, tastes, and passions; but in the government of the world it works as a body on behalf of justice, and the suppliant and the stranger are peculiarly objects of the care of Zeus. Accordingly we find that the cause which is to triumph in the Trojan war is the just cause: that in the *Odyssey* the hero is led through suffering to peace and prosperity, and that the terrible retribution he inflicts has been merited by crime. At various points of the system we trace the higher traditions of religion, and on passing down to the classical period we find that the course of the mythology has been a downward course.

The Troic as compared with the Achaian manners are to a great extent what we should now call Asiatic as distinguished from European. Of the great chieftains, Achilles, Diomed, Ajax, Menelaos, and Patroclos appear chiefly to exhibit the Achaian ideal of humanity; Achilles especially, and on a colossal scale. Odysseus, the many-sided man, has a strong Phœnician tinge, though the dominant colour continues to be Greek. And in his house we find exhibited one of the noblest among the characteristics of the poems in the sanctity and perpetuity of marriage. Indeed, the purity and loyalty of Penelope are, like the humility approaching to penitence of Helen, quite unmatched in antiquity.

The plot of the *Iliad* has been the subject of much criticism on account of the long absence of Achilles, the hero, from the action of the poem. But Homer had to bring out Achaian character in its various forms, and while the vastness of Achilles is on the stage every other Achaian hero must be eclipsed. Further, Homer was an itinerating minstrel, who had to adapt himself to the sympathies and traditions of the different portions of the country. Peloponnesos was the seat of power, and its chiefs acquired a prominent position in the *Iliad* by what on these grounds we may deem a skilful arrangement. But most skilful of all is the fine adjustment of the balance as between Greek and Trojan warriors. It will be found on close inspection of details that the Achaian chieftains have in truth a vast military superiority; yet by the use of infinite art Homer has contrived that the Trojans shall play the part of serious and considerable antagonists, so far that with divine aid and connivance they reduce the foe to the point at which the intervention of Achilles becomes necessary for their deliverance, and his supremacy as an exhibition of colossal manhood is thoroughly maintained.

The plot of the *Odyssey* is admitted to be consecutive and regular in structure. There are certain differences in the mythology which have been made a ground for supposing a separate authorship. But, in the first place, this would do nothing to explain them; in the second, they find their natural explanation in observing that the scene of the wanderings is laid in other lands, beyond the circle of Achaian knowledge and tradition, and that Homer modifies his scheme to meet the ethnical variations as he gathered them from the trading navigators of Phœnicia, who alone could have supplied him with the information required for his purpose.

That information was probably coloured more or less by ignorance and by fraud. But we can trace in it the sketch of an imaginary voyage to the northern regions of Europe, and it has some remarkable features of internal evidence supported by the facts, and thus pointing to its genuineness. In latitudes not described as separate we have reports of the solar day apparently contradictory. In one case there is hardly any night, so that the shepherd might earn double wages. In the other, cloud and darkness almost shut out the day. But we now know both of these statements to have a basis of solid truth on the Norwegian coast to the northward, at the different seasons of the midnight sun in summer, and of Christmas, when it is not easy to read at noon.

The value of Homer as a recorder of antiquity, as opening a large and distinct chapter of primitive knowledge, is only now coming by degrees into view, as the text is more carefully examined and its parts compared, and as other branches of ancient study are developed, especially as in Assyria and Egypt, and by the remarkable discoveries of Dr Schliemann at Hissarlik and in Greece. But the appreciation of him as a poet has never failed, though it is disappointing to find that a man so great as Aristophanes should describe him simply as the bard of battles, and sad to think that in many of the Christian centuries his works should have slumbered without notice in hidden repositories. His place among the greatest poets of the world, whom no one supposes to be more than three or four in number, has never been questioned. Considering him as anterior to all literary aids and training, he is the most remarkable phenomenon among them all. It may be well to specify some of the points that are peculiarly his own. One of them is the great simplicity of the structure of his mind. With an incomparable eye for the world around him in all things great and small, he is abhorrent of everything speculative and abstract, and what may be called philosophies have no place in his works, almost the solitary exception being that he employs thought as an illustration of the rapidity of the journey of a deity. He is, accordingly, of all poets the most simple and direct. He is also the most free and genial in the movement of

his verse: grateful nature seems to give to him spontaneously the perfection to which great men like Virgil and Milton had to attain only by effort intense and sustained. In the high office of drawing human character in its multitude of forms and colours he seems to have no serious rival except Shakespeare. We call him an epic poet, but he is instinct from beginning to end with the spirit of the drama, while we find in him the seeds and rudiments even of its form. His function as a reciting minstrel greatly aided him herein. Again, he had in his language an instrument unrivalled for its facility, suppleness, and versatility, for the large range of what would in music be called its register, so that it embraced every form and degree of human thought, feeling, and emotion, and clothed them all, from the lowest to the loftiest, from the slightest to the most intense and concentrated, in the dress of exactly appropriate style and language. His metre also is a perfect vehicle of the language. If we think the range of his knowledge limited, yet it was all that his country and his age possessed, and it was very greatly more than has been supposed by readers that dwelt only on the surface. So long as the lamp of civilisation shall not have ceased to burn, the *Iliad* and the *Odyssey* must hold their forward place among the brightest treasures of our race.

It is impossible to give any satisfactory account of the Homeric bibliography, not only from its extent, but from the fragmentary manner in which for the most part the subject has been handled, and through the rapid extension of the field by the importation of new knowledge from sources apparently remote, which brings with it new lights. The works of Blackwell and Wood, the latter of which attained to celebrity, will show how slender was the *apparatus criticus* of their time. Thirlwall, Grote, and Mitford, who is now antiquated, contain good ideas, but Grote condemns as pure myth or fable much that is now gradually taking historic form, and vivisects the *Iliad* by resolving it into an Achilleis and an Ilias. The first English writers who indicated a study of the text at once comprehensive and appreciative were Keble in his *Prælectiones Poeticæ*, and Colonel Mure in his *History of the Literature of Greece*. Mr Robert Brown's *Poseidon* is a good example of method in tracing the origin of the Olympian deities. Nägelsbach rendered an essential service by dividing for the first time the *Homerische* from the *Nachhomerische Theologie*. Mure first, I think, taught the need of large and careful collection of matter from the text; and this process has been carried to its consummation by Dr Buchholz of Berlin, whose collection of the *realien* or contents of the poems must have been the work of at least twenty years. This, however, is a meagre notice of a literature which might of itself form the study of a life.

TRANSLATIONS INTO ENGLISH: *Iliad* (verse)—Chapman, Pope, Cowper, Lord Derby, Blackie, Worsley and Conington, Way, Wright, Green; *Iliad* (prose) Leaf, with Myers and Lang; *Odyssey* (verse)—Pope, Chapman, William Morris, Worsley, Lord Carnarvon, Way, Schomberg, 'Avia;' *Odyssey* (prose)—Butcher and Lang. For information on various matters connected with Homer and the Homeric poems, see the articles in this work on ACHILLES, HELEN, TROY, ULYSSES, &c.; also GREECE, Vol. V. p. 390.

Home Rule. See IRELAND.

Homestead. By the Homestead Act of 1862 every citizen of the United States, native or naturalised, who has reached the age of twenty one years, or is the head of a family, is entitled to claim one-quarter section (160 acres) of any of the public lands that are surveyed and otherwise unappropriated. The sole condition attaching to what is virtually a gift from the government to the settler is five years' residence upon the property, something of course being done to improve it. A title is then granted by the general land office in Washington. Except in the case of non-payment of the moderate registration and other fees, the homestead is absolutely exempt from forced sale for debt; the object of this provision being to guard the interests of women and children. See PRE-EMPTION.

Homestead, on the Monongahela River, in Pennsylvania, 8 miles SE. of Pittsburgh by rail, is the main seat of the great iron and steel works of the Carnegie Company, employing 40,000 men. The labour riots of 1892 amounted almost to civil war. Pop. of the 'post-village' (1880) 592; (1890) 7911.

Homicide. See JUSTIFIABLE HOMICIDE, MANSLAUGHTER, MURDER, INSANITY.

Homildon Hill, a battlefield in Northumberland, 1 mile NE. of Wooler. In 1402 Earl Douglas at the head of 10,000 Scots had ravaged England as far as Newcastle, and was returning laden with booty, when on 14th September he was intercepted by an English army under Hotspur and the exiled Earl of March and Dunbar, so posted himself upon Homildon (Humbleton) Hill. Hotspur was eager for a headlong charge, but, by March's advice, the bowmen were set to play upon the Scots, who 'stood long like deer in a park to be butchered,' and, too late descending to come to close quarters, sustained an irretrievable defeat. Douglas himself was wounded in five places, and was taken prisoner, with four other earls, two barons, and eighty knights. See HENRY IV.

Homily (Gr. *homilia*) primarily signifies a discourse held with one or more individuals, but in ecclesiastical use it means a discourse held in the church. The practice of explaining in a popular form the lessons of Scripture read in the synagogues had prevailed among the Jews, and appears to have been adopted in the Christian churches from the earliest times; but we have no sample of this form of composition earlier than the homilies of Origen in the 3d century. The early Christian homily may be described as a popular exposition of a portion of Scripture, accompanied by moral reflections and exhortations. It differs from the sermon (Gr. *logos*, Lat. *oratio*) in following the order of the scriptural text or narrative, instead of being thrown into the form of a rhetorical discourse or a didactic essay. The name homily is, however, very frequently used almost as a synonym for sermon; and *Homiletics* is that branch of theology which deals with the rules for composing sermons and discourses of any kind, sometimes called 'sacred rhetoric.' Ancient collections of homilies or *homiliaria* are very numerous; the most notable being that compiled about 782 by Paulus Diaconus, under Charlemagne's authority.

The Homilies of the Church of England are a collection of sermons, the first part of which was published in 1547, the first year of the reign of Edward VI., to be read in the churches, partly in order to supply the defect of sermons, but partly, also, to secure uniformity of doctrine, and to guard against the heterodoxies, old and new, which at that time threatened the unconsolidated church. The second part was published in 1562, at the same time with the Articles, under Elizabeth. The 35th Article declares that 'the Book of Homilies doth contain a godly and wholesome doctrine, and necessary for these times.' The titles are enumerated in the article, and are twenty-one in number. The

homilies are not now read in churches, but there is no law to prevent their being so read, and they are frequently appealed to in controversies as to the doctrine of the Anglican Church on the points of which they treat. The precise degree of authority due to them is matter of doubt.

Hominy, a preparation of maize, coarsely ground and boiled, a kind of [illegible] porridge.

Homocercal. See Heterocercal.

Homœopathy (*homoion*, 'like;' *pathos*, 'disease'), a medical doctrine, which teaches that diseases should be treated or cured by drugs capable of producing in healthy persons symptoms of disordered health to those presented by them; or, as it is commonly phrased, 'likes should be treated by likes,' or let likes be cured by likes (*similia similibus curentur*).

The earliest mention of this doctrine occurs in one of the books attributed to Hippocrates, who taught that some diseases were cured by similars and some by contraries. He illustrated the former by pointing to mandrake as a cure for mania; 'give the patient,' he says, 'a draught made from the root of mandrake in a smaller dose than is sufficient to produce mania.' Reference is also made to the doctrine of similars by several medical authors during the centuries that followed. In 1738 Stahl, a Danish army surgeon, wrote that 'the rule generally acted upon in medicine to treat by means of oppositely acting remedies is quite false, and the reverse of what ought to be; I am, on the contrary, convinced that diseases will yield to and be cured by remedies that produce a similar affection.' The celebrated Von Stöerck, in 1762, urged the same rule as a reason for using stramonium in insanity. Though impressed with the importance of this doctrine, these writers took no steps towards rendering it available in the practice of medicine. To do this was reserved for Samuel Hahnemann (q.v.), who, in 1796, in an essay entitled 'Suggestions for ascertaining the Curative Powers of Drugs,' published in *Hufeland's Journal*, then the leading medical periodical of Europe, showed, as the result of a series of researches and experiments extending over six years, that in this doctrine lay the key to the selection of specifically acting medicines; of medicines, that is, which cure by exercising a direct influence upon the parts diseased, as distinguished from those which relieve by what is termed their 'derivative' action. For example, it was then, and is now, customary to endeavour to control congestion of the brain by purgatives, by medicines operating not on the brain but upon the bowels. Hahnemann, on the other hand, asserted that congestion of the brain was most quickly and certainly cured by prescribing small doses of a medicine which previous experiment had proved to have a special influence upon the circulation in that organ—a direct method. The nature of this influence, he further showed, must be one of *similarity*. This similarity was, he pointed out, recognised by the symptoms indicating the nature of the disease-process on the one hand, and those marking the action of the drug when taken by persons in ordinary health on the other.

This doctrine, then, applies solely to that part of the treatment of disease which relates to the use of medicines; and further, it is restricted to prescribing medicines in diseases which are not dependent for their existence on some mechanical cause, such as the presence of a mass of undigested food in the stomach, or of a stone in the bladder. To those parts of treatment which are concerned with nursing, dietetics, hygiene, the use of water in various ways, electricity, massage, &c., homœopathy, as such, bears no reference; though those physicians who have adopted it attach great importance to these therapeutic measures. Homœopathy has solely to do with the selection of drugs when these are needed for directly curative purposes—a sufficiently wide range truly! Hahnemann's claims to distinction as a therapeutist rest not merely on his having recognised this doctrine as a rule of drug selection in a wide range of diseases—this had been done to some extent by others, as he himself has admitted—but upon his having rendered it possible to apply it in practice; as he wrote in 1810, 'no one has as yet *taught* this homœopathic therapeutic doctrine.' If it were true that the symptoms evoked by a drug should regulate its employment in disease, the symptoms which drugs will cause must needs be ascertained. Hence the study of drugs by making experiments with them upon healthy persons—drug-proving, as it is termed—became a cardinal point in the teaching of Hahnemann. It forms, indeed, the *first* maxim of homœopathy.

Further, if a medicine is to be used that will produce a condition like that which it is intended to cure, it is obvious that it must be prescribed in a dose smaller than that in which it is capable of producing such a condition. This much was clear to Hahnemann when he first applied homœopathy at the bedside. During the first three or four years of his doing so he used doses of from three to four grains of such medicines as nux vomica and veratrum powder; of arnica powder he gave 'a few grains;' of ignatia, from three to seven grains, and so on. As his experience in the use of medicines upon this basis increased he found that far more minute doses than these were all-sufficient, and in 1806 he writes of his giving hundredths, thousandths, and millionths of the quantities required to obtain the antipathic or allopathic action of a drug. In graduating his doses Hahnemann followed where his experience seemed to lead him, his one desire apparently being to give no more medicine than was absolutely necessary for the cure of disease.

What is the safest, surest, and best dose in which to prescribe a homœopathically chosen medicine is a question upon which there is a great difference of opinion among those who have studied the subject. The only principles upon which there is any unanimity among them are that the dose to cure must be smaller than that which will produce a condition like that to be treated, and that different persons are susceptible to the influence of widely differing doses. The necessity for the dose being a small one is the *second* maxim of homœopathy. The *third* is that medicines must be prescribed in the form in which they were taken when 'proved'—i.e. when the experiments were made which revealed the kind of action they have upon healthy persons. This is essential, because, however well acquainted such experiments may render the physician with medicines individually, they teach him nothing of what the action of such medicines will be when combined with one or more others. He has no means of ascertaining what would be the influence exercised upon the action of his 'base' by the 'corrective' or the 'adjuvant' of the ordinary prescription combination of drugs.

To account for or explain the *modus operandi* of a homœopathically selected medicine several theories have been advanced. Hahnemann put forward one which, however, he at the same time declared that he regarded as of no importance. So far no explanation hitherto attempted has met with any general acceptance from those who admit the truth of the doctrine. It is as an ultimate fact in therapeutics, the reality and value of which can only be ascertained by putting it into practice at the bedside, that homœopathy has always been regarded, rather than as a speculative idea to be

demonstrated or refuted by theoretical discussions or *a priori* arguments. Hence it is to the results of experience in employing homœopathically selected medicines, especially in epidemics notoriously attended by a great mortality under the usual methods of treatment, that those who advocate this method appeal to sustain their position.

For example, in 1836 cholera was devastating Austria, when a petition was presented to the government to allow homœopathy to be tested. Dr Fleischmann was accordingly ordered to fit up a hospital in the Gumpendorf suburb of Vienna for the reception of cholera patients to be treated homœopathically. The result showed that whereas 70 per cent. of those treated in the ordinary way died, Dr Fleischmann lost only 33 per cent.

Again, in yellow fever, in 1878 the American Institute of Homœopathy appointed a commission, consisting of physicians who had had experience in dealing with this disease, to ascertain the number of cases treated homœopathically during the epidemic of that year, and the rate of mortality amongst them. The report showed that in and around New Orleans 3914 cases were treated, with a loss of 261, being a mortality of only 6·6 per cent. in this singularly fatal form of disease.

Lastly, in the city of Melbourne typhoid fever recurs in epidemic form every year. The *Melbourne Herald* of April 20, 1889, gave the following hospital statistics of typhoid for three seasons. During these three epidemics the Melbourne hospital, with 318 beds, received 1182 cases of typhoid, of which 181, or 15·31 per cent., died. The Alfred Hospital, with 144 beds, admitted 998 cases; of these 135, or 13·52 per cent., were fatal. The Homœopathic Hospital, with 60 beds, received 554 cases, of which 49, or 8·84 per cent., died.

Another argument in support of the contention that homœopathy affords a real basis on which to select a medicine is drawn from the fact that Hahnemann, when appealed to in 1832 to suggest the medicines most likely to be useful in cholera, without ever having seen a case, but merely from studying the symptoms of some that were reported to him, and comparing these symptoms with those produced by medicines he had experimented with, named camphor, copper, and white hellebore as the remedies; and these, with the single addition of arsenic, have since been found to be more serviceable in checking the disease than any others. It is consequently urged that for a principle of drug-selection to enable the physician to indicate beforehand the appropriate remedy in an entirely new form of disease is a strong proof of its truth, and evidence of its value.

Finally, homœopathists contend that the unacknowledged adoption of many of the practical results of their teaching by physicians who professedly repudiate homœopathy is an additional proof that this teaching is sound. The text-books on Materia Medica which are now most popular in the medical schools, the *Handbook of Therapeutics*, by Dr Sidney Ringer, and Dr Lauder Brunton's *Materia Medica, Pharmacology, and Therapeutics*, abound with recommendations for the use of medicines in diseases in which they were first known to be of service through homœopathy. Of these, the use of aconite in inflammatory fever is one of the most conspicuous. That it would be found capable of reducing the fever with which acute inflammations are usually ushered in was an inference drawn by Hahnemann from the experiments that he had made with it; and, when publishing his conclusion, he foretold that it would entirely supersede the necessity for blood-letting, then so constantly employed in such cases. It was the endorsement of this statement by Dr Uwins—who had to some extent tested the worth of homœopathically selected medicines—at a meeting of the London Medical Society in 1836 that so shocked the members present as to induce them to pass a resolution precluding all reference to homœopathy at any future meeting. To use aconite in small doses in acute inflammatory fever is thoroughly homœopathic, and is at the same time a very common practice now among those who deny that homœopathy is of any value to the physician. Many other medicines there are that are very generally used by opponents of homœopathy in conditions to which they are homœopathic, and in which they were originally made known to be useful by those who practise homœopathically; such, for example, as arsenic in gastric irritation, ipecacuanha in vomiting, corrosive sublimate in dysentery, belladonna in quinsy, &c.

While homœopathists accept these appropriations as so many tributes to the truth of their doctrine, and look upon them as important advances in therapeutics, at the same time, in the absence of any knowledge on the part of those who use them of the doctrine which led to their employment, they regard them as calculated to give rise to disappointment in some instances. They do so for the reason that all cases of a given form of disease are not so precisely similar as to admit of cure by the same medicine. Thus, to give belladonna in all quinsies, while of advantage in many, would be useless in some, because all cases of quinsy do not resemble that produced by belladonna. Some are more like that occasioned by mercury, others that of the poison of the honey-bee, or of one of the serpent poisons, others that of the *Phytolacca decandra*, and so on; and it is, the homœopathist argues, only when the doctrine of homœopathy is strictly adhered to in each *individual instance* of a disease that that success which he contends will follow his method can be looked for.

From the date of the publication of Hahnemann's first essay on Homœopathy the opposition this doctrine has met with from the great majority of the profession in Great Britain has been of the most determined and persistent character. Of late years the intensity of the bitterness of feeling which this controversy aroused has been somewhat mitigated, or perhaps the influence of public opinion has prevented its indulgence to the same extent as formerly. The last attempt to deprive a physician of his hospital appointment on the ground that he was treating his patients homœopathically failed, while several open adherents of this doctrine are to be found holding public health and poor-law appointments. The number of those who in Great Britain admit that they practise homœopathy has never at any one time exceeded 300. The chief hospital where homœopathy is practised is the London Homœopathic (1850), with ninety beds and a large out-patient department. There are similar institutions at Birmingham, Liverpool, Bath, Plymouth, Bournemouth, Eastbourne, and Bromley; and a convalescent home in connection with the London Hospital has recently been opened at Eastbourne. In addition to these there are about a hundred homœopathic dispensaries in different parts of the country.

In the United States of America, where public opinion is more powerful than professional feeling, homœopathy has spread rapidly and widely, and it is estimated that nearly one-fourth of the qualified practitioners of medicine in that country have adopted it. There are over fifty hospitals and nearly as many dispensaries; and the journals devoted to homœopathy exceed a score in number. It is taught in thirteen medical colleges and in three of the universities. In Europe there is only one university where there is a chair of Homœopathy viz. at Budapest.

Though Hahnemann is denounced by many as a 'fanatic and a 'knave,' and notwithstanding that homœopathy has very generally been set aside as a 'fraud,' no one can study the history of medicine during the 19th century without perceiving the powerful influence it has had on the general practice of the medical profession. While, during the last fifty years of the century, homœopathy was gradually becoming more frequently practised, the weapons commonly used against disease were of the most formidable character. Bleeding by lancet, leeches, and cupping glasses, mercurialism, purgatives, &c. were in constant use. The progress of homœopathy in Austria, and the assumption on the part of some physicians that it was a purely negative mode of treatment, the success of which was due to the omission of all drugs, led to that scepticism in medicine which, originating with Skoda in Vienna, prevailed throughout the profession during the next twenty years. 'Placebos' took the place of the lancet, bread-pills formed a substitute for purgatives, and 'ptisans' did duty for mercury. As the literature of homœopathy increased a revival of interest in the use of drugs followed; and during the last twenty years the method of studying the actions of drugs originally suggested and carried out by Hahnemann has been adopted to a very large extent, under the designation of pharmacology; while, for practical purposes, the uses of drugs proposed by homœopathists, and set forth in their journals and published works, have, as has already been stated, been very largely followed. See the article MEDICINE.

The chief authorities on homœopathy are: *The History of Homœopathy—its Origin and Conflicts*, by Dr Amcke, translated by Dr A. E. Drysdale; *Lectures on Homœopathy*, by Dr Dudgeon; *Homœopathy—its Principle, Method, and Future*, by Dr Pope; *Fifty Reasons for being a Homœopath*, by Dr Burnett; *A Manual of Therapeutics*, by Dr Hughes; *A Manual of Pharmacodynamics*, by Dr Hughes. *The Homœopathic Review* and *The Homœopathic World* are published monthly.

Homology. See ANALOGY, and DARWINIAN THEORY, Vol. III. p. 689.

Homoousian (Gr. *homos*, 'the same,' and *ousia*, 'substance') and HOMOIOUSIAN (Gr. *homoios*, 'like,' and *ousia*, 'substance'), two terms that long distracted the primitive church in connection with the Arian and semi-Arian controversies. See ARIUS, CREEDS.

Homoptera (Gr. *homos*, 'the same, uniform;' *pteron*, 'a wing'), a division of the insect order Hemiptera (q.v.), including Coccus insects, Aphides, Cicadas, &c. (q.v.).

Homotaxis. See CONTEMPORANEITY.

Homs. See HEMS.

Honan, one of the central provinces of China, desolated in 1887 by the inundation of the Hoang ho. See CHINA, HOANG-HO.

Honawar, a small seaport on the Malabar or west coast of India, is a town in the district of North Kanara, in the presidency of Bombay, and is 340 miles SSE. of Bombay. Pop. 6658.

Honduras, a Central American republic, since 1895 confederated with Nicaragua and Salvador as part of the República Mayor de Centro-América, lies between Nicaragua and San Salvador and Guatemala, and is bounded on the N. and NE. by the Bay of Honduras and the Caribbean Sea, having here a coast-line of some 400 miles; while on the S. the Bay of Fonseca, over 50 miles long and about 30 wide, opens to the Pacific. The area of Honduras is calculated at 46,500 sq. m.; the pop. is stated at 435,000. Except for a narrow strip of swamp-land along either coast, the country is a tableland, its series of elevated plateaus broken by broad and fertile plains and valleys, or rising to mountain-ridges that reach 8000 feet (highest peak, the Montaña de Selaque, 10,120 feet). There are no active volcanoes. The Cordilleras proper traverse the country irregularly in a north-west and south-east direction. Honduras is watered by innumerable streams, though these are seldom navigable, and then only for short distances; the Wanks or Segovia, which forms for many miles the boundary with Nicaragua, has a length of 350 miles. Roatan and the other fertile Bay Islands (q.v.), off the north coast, belong to Honduras, as well as two small islands in the Bay of Fonseca. The climate is hot on the coast, where also fever prevails; but in the highlands the temperature is low, and in the principal towns the mean is 74° F. In the mountains heavy frosts encrust the leaves of the pine and oak forests in November and December; but snow has never been known. Generally speaking, the rainy season extends from May to November. The flora and fauna are very nearly the same as those of Guatemala (q.v.); but in Honduras the raising of cattle is an important industry, while agriculture receives no such attention as in Guatemala. In minerals Honduras is the richest of the Central American republics. Silver ores in almost every variety are abundant; gold is washed principally in Olancho, and mined in one or two places; rich iron ores are found, mostly magnetic; also copper, antimony, platinum, zinc, and tin. There are beds of lignite in Gracias department, and famous opals that are second only to those of Hungary. The mineral resources have never been properly developed, but now that several North American and other foreign companies are at work, and especially since a waggon-road has been constructed from the Pacific coast to Yuscaran (122 miles), by which heavy machinery can be conveyed into the heart of the silver belt, there is every prospect of scientific methods being successfully applied. The exports in 1895, mostly to the United States, and consisting chiefly of cattle, fruits and cocoa-nuts, india-rubber, sarsaparilla, timber, and indigo, exceeded 1,800,000 dollars. The imports may be estimated at 1,500,000 dollars.

The republic is divided into thirteen departments. Under the revised constitution of 1894 (after the successful revolution of that year), the president is elected for four years, and is assisted by six ministers; and the legislative power is vested in a congress of thirty-seven deputies. The president, however, is for all practical purposes a dictator. The active army consists of 500 men, the militia of 3000. The finances of the country are extremely embarrassed, partly owing to wars with the two neighbouring states in 1872–76; while three loans contracted on heavy terms in London and Paris in 1867–70, for the purpose of making an interoceanic railway, have left Honduras saddled with a foreign debt of £5,398,570, exclusive of the interest, which has been accumulating since 1872; and for this there is only a line from Puerto Cortez to San Pedro Sula (38 miles) to show. The internal debt is returned at 2,745,000 dollars. The revenue for the year 1895 was put at 1,550,000 dollars, the expenditure at 1,543,000 dollars.

Honduras was discovered by Columbus on his fourth voyage, in 1502, and derives its name from the Spanish *honduras*, 'depths,' in allusion, according to the common account, to the difficulty he experienced in finding anchorage on its coast. There are numerous pyramids and other remains of the ancient inhabitants. Honduras threw off the yoke of Spain, with the rest of Central America, in 1821, and became independent on the dissolution of the confederation in 1839. Revolutions and frequent wars with Guatemala and San Salvador ended only in 1876, since when a considerable

improvement is visible. Education is nominally compulsory, and there are primitive state-schools in the towns and large villages, besides a college in Tegucigalpa and Comayagua. The whites are very few in number, the Indians, negroes, and mixed races including all but some 6000 or 7000 of the population. On the Mosquito coast there is a considerable population of so-called 'Caribs' (q.v.). There are no towns of any importance, the largest being the capital, Tegucigalpa, with 12,000 inhabitants. The ports are Amapala, on the Bay of Fonseca, Puerto Cortez or Puerto Caballos, Omoa, and Truxillo. There were fifty-six post-offices in 1890 and 1800 miles of telegraphs, both maintained at a considerable loss; and, besides a continuation of the interoceanic railway, a line is projected between Puerto Cortez and Truxillo, through a rich fruit district.

Honduras, British. See Belize.

Hone, William, a versatile and industrious English writer, was born at Bath, June 3, 1780. He had but little education, and, after some years of hopeless drudgery in London as a lawyer's clerk, at twenty started a book and print shop there. But his busy mind was too full of all kinds of extraneous projects for success in business; and after no long time savings-bank schemes and lunatic asylum inquiries brought him to bankruptcy. He struggled bravely to get bread for his already numerous family by writing to various papers, started the *Traveller*, and next the *Reformist's Register* (February 1–October 25, 1817), which quickly carried his name across England by its brilliant political squibs and parodies, and by the caricatures of Cruikshank. On the 18th, 19th, and 20th December 1817 he was subjected to three separate trials before special juries for publishing things calculated to injure public morals and bring the Prayer-book into contempt. The prosecution was of course really political rather than religious, and the strongest pressure was brought to bear upon the court, yet Hone was acquitted on all three counts, after defending himself, weak in health as he was, with remarkable vigour and ability for over six hours each day. Among the more successful of his later satires, all illustrated by Cruikshank, were *The Political House that Jack built*, *The Queen's Matrimonial Ladder* (for Queen Caroline), *The Man in the Moon*, and *The Political Showman*. Works that revealed much reading in obscure channels were the *Apocryphal New Testament* (1820) and *Ancient Mysteries Explained* (1823). The *Every-day Book* (1826), *Table-book* (1827–28), and *Year-book* (1829) contained rich stores of information on manners and antiquities, into which most later miscellaneous writers upon folklore and popular traditions have burrowed. Yet their stout-hearted compiler at the end found himself in a debtor's jail, from which his friends extricated him to start him in a coffee-house—also a failure. In 1830 Hone edited Strutt's *Sports and Pastimes*, and contributed later to the *Penny Magazine* and the *Patriot*. In his last years he swung back to the devout theology of his mother's hearth, and often preached on Sundays. He died at Tottenham, 6th November 1842.

Hones. See Whetstones.

Honesty (*Lunaria*), a genus of plants of the natural order Cruciferæ, of which two species, natives of the south of Europe, *L. annua* or *biennis* and *L. rediviva*, have long been cultivated in British flower-gardens, on account partly of the beauty of their flowers, and partly of the curious appearance of their large flat seed-pouches (silicules), or rather their large oval membranous dissepiments, which are very persistent, resemble polished films of mother-of-pearl, and are frequently used as mantelpiece and table ornaments.

Honesty (*Lunaria biennis*) in seed.

The origin of the English name is doubtful. Some of the older English poets mention the plant as *Lunarie*—'in sorceries excelling;' for it was reckoned among herbs potent for magic.

Honey is a sweet, thick liquid produced by bees and other insects of the same genus. The working bees gather the nectar from the nectaries of flowers, and also sweets from other sources when nectar is scarce, which they carry home to the hive in the crop or honey-bag. Here it appears to undergo a transformation, by which it becomes honey before it is disgorged into the cells of the comb. Yet the change is such that many of the distinctive characteristics of the various materials can be traced in the manufactured honey. Thus we find clover and heather honey easily distinguishable, the clover-honey being a clear white—almost greenish-white—fluid liquid; while that obtained from the heather has a rich amber colour, and is much more viscid, so that it cannot be slung from the combs without destroying them. The flavour and colour of other flowers can also be distinctly traced in various honeys, such as that made from the flowers of the ivy and that from honey-dew, the produce of the Aphides, which may be seen in summer in the form of a sticky liquid on the leaves of the lime and other trees. In default of better food bees sometimes resort to this honey-dew. But it imparts a blackish hue to the honey and a disagreeable flavour.

Honey contains dextro-glucose and lævo-glucose, cane-sugar, as also gummy, waxy, colouring matter, and essential odorous oils, along with water and a minute quantity of mineral matter and pollen. The proportion of crystallisable sugar increases with the age of the honey, so that in time it acquires a granular consistency. Exposure to light and cold increases this tendency, which is stronger in some kinds of pure honey than in others.

As an article of commerce and for human consumption honey is presented both in the comb and as run honey. The run honey is separated from the wax of which the storing cells are composed,

by the centrifugal extractor, or by the more tedious and less perfect method of cutting the comb in pieces and running the honey through a bag placed near a fire. The best form of comb honey is that which is termed virgin honey. It is contained in pure white cells of very thin wax. These cells have never been used by the bees for any other purpose than the storage of honey. When the cells have been previously used for the incubation of eggs and the development of bees through the larva stage they become discoloured and much thicker in the walls, and after repeated use in breeding they become quite black. Comb honey in dark-coloured cells is of very inferior quality.

From the remotest times honey has been employed as an article of food. And to the ancients, who were unacquainted with sugar, it was of more importance than it now is. 'A land flowing with milk and honey' offered the highest conceivable advantages to the eastern mind. The honey of Hymettus, a mountain in Attica, and of Hybla, a mountain in Sicily, were of old held in high repute, doubtless in consequence of the wild thyme and other fragrant herbs growing upon them. The honeys of Narbonne and of Chamonix for similar reasons are now held in high estimation, as also the heather-honey of Scotland. Taken in moderate quantity, honey is nutritive and mildly laxative. Some few kinds possess poisonous properties, such as that of the Brazilian wasp and the honey of Trebizond gathered from the *Azalea pontica*. Much adulterated honey is sold; see ADULTERATION.

As a demulcent and flavouring agent honey is used in many preparations of medicine. It is also used in the preparation of several popular sweetmeats and in the manufacture of some kinds of ale. Mead is a fermented liquor made from the washings of the combs from which honey has been extracted. Large quantities of honey are annually imported into Great Britain from America, especially from California, where many large bee-farms exist. See BEE; and for the Honey Ant, see ANT.

Honey-buzzard, or BEE KITE (*Pernis apivorus*), one of the Falconidæ, allied to both kites and buzzards, but with many peculiarities, such as the thick feathering of the sides of the head down to the base of the bill. It winters in Africa, and breeds in the wooded districts of north Europe, ranging, however, as far east as China and Japan. To Britain it is usually only a visitor, and that not very commonly; but there are records of its occasional breeding here. Howard Saunders tells how collectors of 'British' specimens paid £5 for a couple of eggs, or £40 for a pair of old birds, till the breeding virtually ceased. The honey-buzzard owes its name to its habit of plundering the nests of bees and wasps for the sake of the larvæ, and apparently also the honey. It also devours grubs of many kinds and various small animals. The nest, often founded on that of some other kite, is situated on some leafy tree, and may be further concealed by a covering of leaves, which are replaced as they wither. The eggs, usually two, are laid in June, which is late for a bird of prey. The genus includes a few other species.

Honeycomb Moth, or BEE MOTH (*Galleria*), a genus of small moths in the same family as the Grass moths (Crambus), and noteworthy for the habit some of the species have of infesting beehives. There they deposit their eggs; and the larvæ feed on the honeycomb, through which they make tunnels lined with silk. In a corner of the hive the cocoons are spun, and the metamorphoses accomplished. There are two broods in the year, and the later pupæ sleep through the winter. The best-known species, *G. mellonella*, is a satiny moth, about an inch across the wings. When they occur in numbers they are very injurious or even quite fatal to the hive. They appear to enjoy immunity from the stings. A smaller species (*G. alvearia*) is

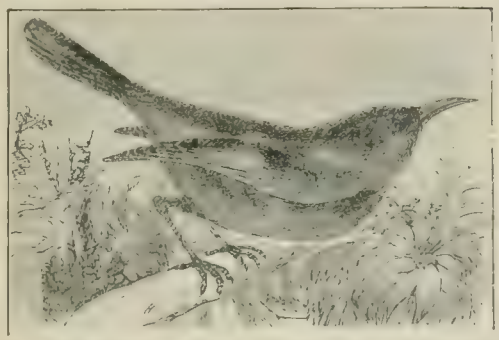
Honeycomb Moth:
1, Gallleria mellonella (male); 2, larva; 3, pupa; 4, cocoon; 5, larva in its way through the hive; 6, Galleria alvearia (male).

also distinguished by some authorities. Humblebee nests are infested as well as bee-hives.

Honey-dew, a viscid saccharine exudation which is often found in warm dry weather on the leaves and stems of plants, occurring on both trees and herbaceous plants. It is often, but not always, associated with the presence of Aphides, Cocci, and other insects which feed on the juices of plants, and its flow is ascribed to their punctures; but the rupture of the tissues from any other cause, such as the state of the weather, seems also to produce it, and warm dry weather seems to be necessary for the production in the sap of that superabundance of sugar which is thus thrown off. Aphides themselves exude by certain peculiar organs (see APHIS) drops of a fluid which is called honey-dew, which probably differs considerably from the direct exudation of the plants on which they feed, but mingles with it where they abound. Honey-dew is often so abundant as to fall in drops from one leaf to another on to the ground, sometimes falling from trees even as a copious shower. Different kinds of manna are the dried honey-dew or saccharine exudation of certain plants. See MANNA. But very generally this exudation, as it dries, coats the surface of leaves and branches with a clammy film, to which everything brought by the atmosphere adheres, and on which moulds and other small fungi soon grow, and thus the pores of the plant are clogged and its health is impaired. Gardeners are therefore careful to wash off honey-dew with the syringe. Orange and lemon plantations sometimes suffer great injury from the abundance of honey-dew; and it has proved a cause of very great loss in the coffee-plantations of Ceylon.

Honey-eater, or HONEY SUCKER, the name of a large family of birds, Meliphagidæ, tribe Tenuirostres, order Insessores, characterised by their long, sharp, slender, curved bills, and their long cleft extensile tongue terminating in a pencil of bristle-like filaments. They are entirely confined to Australia and the islands included in the Australian region, where they are very abundant, living on honey and insects, which they are particularly well adapted for gathering from the flowers of such trees as the Eucalyptus and Banksia. Twenty-three genera and 190 species are enumerated. Several of the genera are confined to Australia, others to New Zealand, and a few range over the whole Australian region. In India and Africa they are replaced by the Sun-birds (Nectariniidæ). They are birds of active habits and generally very beautiful

plumage. One species, called by the Australians the Rifleman or Rifle-bird (*Melipliaga* or *Ptilotis paradiseus*), is said to be the most gorgeously-plumaged of all known birds; the female is more sombre in dress. Another species (*Myzantha melanophrys*) is called the Bell bird, because its voice resembles the tinkling of distant sheep-bells.



New Holland Honey eater (*Meliphaga Nova Hollandiæ*).

To this family is referred the Parson-bird or Tui (*Prosthemodera Novæ Zeelandiæ*), a bird larger than a blackbird, and of a bluish or greenish-black colour, with white streaks on the back of the neck, a white spot on each wing, and two tufts of snow-white downy curly feathers ornamenting the sides of the throat. Unlike most of the Meliphagidæ it is a bird of fine song. It has also great powers as a mocking-bird, readily learns to speak many words, and becomes very familiar in domestication.

Honey-guide, Indicator, or Moroc, a genus of birds (Indicator) formerly classed as cuckoos, and to an extent partaking of their habits, but now ranked as a small separate family (Indicatoridæ), perhaps most nearly allied to the woodpeckers and barbets. Of eleven species known eight are peculiar to Africa. They are all birds of similar coloration, being generally of a dull gray tinged with yellow or olive; they vary considerably in size, the larger species measuring about 8 inches in length, the smaller not exceeding four inches. They have acquired their name from their habit of guiding men to honey, a curious instinct prompting them to hop from tree to tree before the traveller whose notice they have succeeded in attracting by fluttering and uttering a peculiar cry, and to lead to a place where a bees' nest may be found. The cry is said to change in character on reaching the locality of the nest.

Honey Locust Tree (*Gleditschia triacanthos*), also known as the Sweet Locust and Black Locust, and in Britain as the Three-thorned Acacia—a lofty and beautiful tree of the natural order Leguminosæ, sub-order Cæsalpiniæ, a native of the valleys of the Alleghanies and of the basin of the Mississippi. It is not found wild on the Atlantic coast of North America, although often planted for ornament in the vicinity of habitations. The flowers—which are small, greenish, and in spikes—have, when perfect, six stamens and one pistil, but are very generally unisexual. The leaves are twice pinnate, without terminal leaflets, the numerous small leaflets giving a peculiar gracefulness to the foliage, which is of a light shining green. The tree is furnished with numerous sharp triple spines. The pods are long, flat, pendulous, often twisted; the seeds large, brown, and enveloped in a pulp, which, when the pod is ripe, is very sweet. Sugar has been made from it, and when fermented it yields an intoxicating beverage in use among the American Indians. The honey locust attains a height of 70 or 80 feet. Trees of large size are to be seen in some parts of Britain. The wood resembles that of the Locust Tree (q.v.), or False Acacia (*Robinia pseudacacia*), but is more coarse-grained.

Honey-stone, or Mellite, a mineral of remarkable characters and composition, found in connection with brown coal (generally accompanied by sulphur) in several places in Germany. It occurs in square octahedrons, looks like a honey-yellow resin, and may be cut with a knife. It is a mellate of alumina, consisting of mellitic acid, alumina, and water.

Honeysuckle (*Lonicēra*, or, according to some botanists, *Caprifolium*, which others make a sub-genus of Lonicera), a genus of plants of the natural order Caprifoliaceæ. They are shrubs, often twining, and have the flowers two or more together in axillary heads. The calyx is short and 5-toothed; the corolla tubular-funnel shaped, 5-cleft, generally two-lipped; the fruit a 2- or 3-celled berry, containing one or very few seeds. The Common Honeysuckle, or Woodbine (*L. Periclymenum*), is very abundant in woods and thickets in most parts of Britain. On account of its beautiful cream-coloured whorls of flowers, and their delicious fragrance, it is often planted in shrubberies and trained against walls. It is said to be the 'twisted eglantine' of Milton. The phenomena observed in its growth have been adduced in proof of a *perceptive power* in plants; the branches shooting out till they become unable to bear their own weight; and then, on their meeting with any other branch, twining around it, from right to left; but if they meet only with one another, twining in different directions, one to the right, and another to the left.—Very similar to this is the Perfoliate Honeysuckle

Perfoliate Honeysuckle (*Lonicēra caprifolium*). *a*, flower; *b*, fruit.

(*L. caprifolium*), with paler whorls of flowers, and remarkable for having the upper leaves united so that an opposite pair form one leaf, through the middle of which the stem passes. This peculiarity is confined to the flower-bearing shoots, and does not occur on the young runners; it is also most perfect nearest the flower. This species is a native of the south of Europe, but is now naturalised in many parts of Britain, and much planted, as, although less powerfully fragrant than the Common Honeysuckle, it flowers earlier.—There are numerous other species, natives of Europe, Siberia, and North America. The Fly Honeysuckle (*L. Xylosteum*) is an erect shrub, a native of Europe and Asia, scarcely indigenous in Britain, but common in shrubberies. Its branches are not unfrequently used in some parts of Europe for tubes of tobacco-pipes; and it is said to make good hedges in dry

soils. Other erect species are not unfrequently planted in shrubberies. The Trumpet Honeysuckle (*L. sempervirens*), called in America the Coral Honeysuckle, is a native of the southern states of North America, often planted in Britain on account of its beautiful flowers, red on the outside, and scarlet within, which, however, have no fragrance. It is a twining evergreen shrub. The berries of the honeysuckles are nauseous. The name honeysuckle is also given to shrubs very different from this genus, but of which the flowers abound in honey, as to species of Banksia in Australia. *Azalea viscosa* is called Swamp Honeysuckle in North America. See also FRENCH HONEYSUCKLE.

Honfleur, a seaport in the French department of Calvados, is situated on the southern side of the Seine estuary, opposite to Havre, from which it is 7 miles distant. It is irregularly built, dirty, and uninteresting. There is a school of hydrography, and one of its churches is a celebrated place of pilgrimage to sailors. The commerce of Honfleur, once of much greater importance than at the present time, has been absorbed in great measure by Havre. But the harbour and its approaches were greatly improved in 1874–81, and there is still a considerable export of eggs, butter, poultry, corn, and cattle, mostly to England, and import of iron and coal, and of timber from Norway. The principal manufactures are leather, cast-metal, and refined sugar. There are also rope-walks and shipbuilding yards. Pop. 9265.

Hong-kong, or HIANG-KIANG ('sweet waters'), an island of southern China belonging to Great Britain, situated on the east side of the river Canton, and about 90 miles S. by E. from the city of Canton. It consists principally of a rugged ridge of granitic rocks, extending from north-west to south east, and has an area of 29 sq. m. Barren and desolate, with scarce any traces of cultivation, the island itself presents a striking contrast with the beauty of its harbour, a magnificent sheet of water, 10 sq. m. in extent, one of the finest in the world, which stretches between the northern shore of Hong-kong and the peninsula of Kowloon on the opposite mainland. The straits that separate the two are scarcely half a mile wide on the east, but expand greatly towards the west.

It is to the excellence of its harbour, to the fact that it has been made a free port, and to its being the headquarters of European finance in eastern Asia, that Hong-kong owes its importance as the principal commercial entrepôt of southern China, if not of eastern Asia. The annual value of the merchandise brought into Hong-kong ports exceeds £19,000,000, and the value of that carried thence is more than £22,000,000. The trade between Hong-kong and Great Britain amounts to a value of 3 million pounds sterling for exports from Hong-kong, and more than 1¾ million for imports into Hong-kong. The principal objects of commerce are opium (imported) and tea and silk both exported; the Chinese trade in these last two commodities is almost exclusively in the hands of Hong-kong merchants. Other articles of trade are sugar, flour, rice, salt, hemp, copper, lead, iron, woollens, earthenware, nut-oil, amber, cotton, sandalwood, ivory, betel, vegetables, live-stock, granite, and shipping stores. The last named, together with sugar, rum, ice, and ropes, are the chief manufactures on the island. Hong-kong is in regular steam communication with Europe, India, Singapore, Australia, Japan, Canada (Vancouver), and San Francisco. Every year several thousand Chinese coolies pass through the port going abroad and returning home. In the five years ending 1890 the emigrants averaged 66,700 annually; in 1894 the immigrants were more than 96,000. The mean annual temperature is 75° F. The summer is hot and generally rainy; but the island is not unhealthy upon the whole, except at certain seasons. In 1894 it was ravaged by a bubonic plague like that of the Middle Ages (see Eitel's *Europe in China: the History of Hong Kong*, 1895). Thunderstorms are frequent, and typhoons occasionally work great havoc. An observatory is maintained on the island. From 5000 in 1841 the inhabitants increased to 37,058 in 1851, and to 123,511 in 1861, to 123,898 in 1871, to 160,402 in 1881, and 221,441 in 1891—210,995 being Chinese (partly British subjects), and 1901 Indians. Of the whites, half are of Portuguese origin, and a third English. Hong-kong is the seat of a British governor and is a British naval station (see COALING STATIONS). The city of Victoria, the capital of the island, stretches some 4 miles along the northern shore, and from its situation on the slopes and terraces of the hills overlooking the harbour and its handsome streets and houses, is justly entitled to be called one of the finest cities in the East. Here dwell all the Europeans and most of the Chinese portion of the population. On the mainland the extremity of the peninsula of Kowloon, embracing an area of 2⅜ sq. m., was ceded to Great Britain in 1861, and now forms administratively part of the dependency of Hong-kong. The island was first occupied by Great Britain in 1841, and was secured to her in the following year by the treaty of Nanking.

Honiton, a market-town and municipal borough (1846) of Devonshire, near the left bank of the Otter, 17 miles by rail ENE. of Exeter. Four times devastated by fire between 1747 and 1797, it is a modern well-built place; but its old parish church, on a hill, contains a fine oak-screen, erected in 1482 by Bishop Courtenay of Exeter. The famous Honiton pillow-lace, a manufacture introduced here by Flemish refugees in the middle of the 16th century, is still a specialty of the district (see LACE). The beautiful vale of Honiton is famous for its butter. Honiton was disfranchised in 1868. Pop. (1851) 3427; (1891) 3216.

Honolulu, the capital of the Hawaiian or Sandwich Islands, is situated on the southern coast of the island of Oahu. It is at once the seat of government and the commercial centre of the Hawaiian state; but it was not originally the capital, and its importance is of modern growth, being due to the fact that its harbour is the only really well-protected port in the Archipelago. The harbour, which has attracted to Honolulu first whaling vessels and subsequently traders of all

kinds, is not a large one. It is entered through an opening in the coral-reef, is 150 yards wide at the entrance, and extends for rather more than a mile in a north and south direction. The town stands close to the shore, on a narrow plain at the mouth of the Nuuanu valley, which runs back between cliffs into the main range of Eastern Mountains. The strip of flat land on which the town is built is naturally bare and dry, and the mountains, which protect the harbour from the north-easterly trade-winds, also keep off the rain, so that the rainfall at Honolulu is much smaller than in some other parts of the islands. Water-works, however, supply irrigation, which keeps the gardens of the town bright with flowers and foliage. The centre of the town is well laid out in rectangular streets, with houses built in European style; most of the appliances of civilisation are to be found, notably telephones; there are fine government buildings, and an interesting public library. The climate is pleasant, the least healthy time being when southerly or south-westerly breezes blow; food-supplies are plentiful; and ships running between America and Asia or Australasia constantly call at the port. The population is estimated at over 20,000, including a large number of foreigners; for the trade is almost entirely in foreign hands, and the town is described as 'having a thoroughly American aspect.' See also HAWAII.

Honorarium. See FEES.

Honorius, FLAVIUS, second son of the Roman emperor, Theodosius the Great, was born in 384. On the death of his father the empire was divided between him and his brother Arcadius, Honorius receiving the western half, with Rome as his capital. Being only ten years old, he was put under the guardianship of Stilicho (q.v.), who was the *de facto* ruler of the western empire until 408. After the death of Stilicho, who had been the strong bulwark of western Rome against the barbarian invasions, Alaric the Goth overran Italy, and besieged Rome, and took it in 410. A new champion of the empire arose in Constantius, who was appointed the colleague of Honorius in the consulship, and received in marriage (417) the hand of his sister Placidia, along with a share in the empire. But he did not long enjoy his good fortune, as his death took place a few months after. Thereafter things went from bad to worse in the empire, and the weak Honorius lost his hold of the fair provinces beyond the Alps, whilst Africa was a seething caldron of revolt and civil war. The first emperor of the West died in 423, at Ravenna, which he had made his capital in 403. See J. B. Bury's *History of the Later Roman Empire* (1890).

Honorius I., who succeeded Boniface V. as Bishop of Rome in 625, was born of a consular family in Campania. His name is connected with the history of the paschal controversy in Ireland and with that of the early Anglo-Saxon Church. During his pontificate the bishopric of York was elevated to the rank of an archbishopric, and the festival of the Elevation of the Cross was instituted. At the height of the Monothelite (q.v.) controversy Honorius, at the suggestion of Sergius, patriarch of Constantinople, abstained from condemning the new doctrines, and for his lukewarmness in so doing was stigmatised as a heretic at the Council of Constantinople (680). He died in 638, and was succeeded by Severinus. Some letters of his are preserved in Labbe's *Collectio Conciliorum*, vol. iii.

Honour, MAIDS OF. See HOUSEHOLD.

Honourable, a title given in the United Kingdom to the younger sons of Earls, and all the children of Viscounts and Barons; to Maids of Honour, Lords of Session, the Supreme Judges of England and Ireland. For the persons entitled to be styled 'Honourable,' 'Most Honourable,' and 'Right Honourable' respectively, see ADDRESS (FORMS OF). In America custom attaches the title of Honourable to the names of governors of states, judges, members of congress, and other public functionaries.

Honours, MILITARY. See SALUTES; and for Honours of War, see CAPITULATION.

Hontheim, JOHANN NIKOLAUS VON, was born at Treves, 27th January 1701. He was educated in the Jesuit school of his native city, studied canon law at Louvain, and afterwards taught it for ten years at Treves, of which see he became suffragan bishop in 1748. He is the author of two works on the history of Treves, *Historia Trevirensis Diplomatica* (3 vols. 1750) and *Prodromus Historiæ Trevirensis* (2 vols. 1757). But he is chiefly memorable for a theological essay in Latin, *On the State of the Church and on the Legitimate Authority of the Roman Pontiff* (1763). This he published under the *nom de plume* of Justinus Febronius, whence the system of church government which the work propounds has been called Febronianism. His scheme may be described as an exaggerated form of Gallicanism, with the democratic element of congregationalism superadded. The work was condemned by Clement XIII. immediately after its appearance. When it became known in 1778 that Hontheim was the author, Pius VI. required from him a retractation of his doctrines. But three years later in his *Commentarius* Hontheim repeated his old views. He died at Montquintin in Luxembourg, September 2, 1790. See O. Mejer, *Febronius* (Tübingen, 1885).

Honthorst, GERARD VAN, Dutch painter, born at Utrecht on 4th November 1590, and died there on 27th April 1656. He was a member of the painters' guild of Utrecht (1622–37) and of that of The Hague (1637–52). He twice visited England (1620 and 1628), and painted portraits of the royal family and an allegory (now at Hampton Court). He also found patrons in Elizabeth of Bohemia and the princes of Orange. His best pictures are imitations of Caravaggio, whose works greatly influenced him whilst studying in Rome; he was particularly fond of painting interiors dimly illumined by lamps or candles. The 'Liberation of St Peter,' the 'Martyrdom of St John,' the 'Musician,' the 'House in the Wood,' and the portraits of Mary de' Medici, the king and queen of Bohemia, and the Duke of Buckingham may be taken as representative of his skill.—His brother WILLIAM (1604–66), an historical and portrait painter, worked for the court of Berlin from 1650 to 1664.

Honvéd ('Land-defenders'), the name given in Hungary under the earlier kings to the national champions. In the summer of 1848 the term was revived, and applied first to the revolutionary armies, and after the organisation of the Hungarian landwehr in 1868 to that body of men.

Hood. The academic hood is a modification of the monks' cowl; the right to wear hoods is bestowed by universities and by certain chartered colleges, and the value and source of the wearer's degree are indicated by the material, shape, and colour of the hood. A very complete list of university and other degrees and hoods is given in *Whitaker's Almanack*.

Hood, MOUNT. See CASCADE RANGE.

Hood, ALEXANDER, Lord Bridport, admiral, born in 1727, was the younger son of the vicar of Thorncombe, near Axminster, and younger brother of the more famous Viscount Hood. The date of

his entry into the service was 1741. Both the Hoods entered under the patronage of Admiral Smith, called 'Tom of Ten Thousand.' There has been some confusion between the exploits of the brothers—thus a victory at Hyeres, in command of the *Antelope* in 1757, has been erroneously attributed to the younger brother. In 1746 Alexander Hood became lieutenant, and in 1756 attained the command of the *Prince George* (90 guns). After service in the Mediterranean and Channel under Saunders and Hawke, he again distinguished himself in 1760, while in command of the *Warwick* frigate (32 guns), by recapturing from the French the *Warwick*, a 60-gun ship formerly English, but now armed with 34 guns. During the war of American independence he served much under Keppel, Rodney, and Howe in the Channel and the Strait of Gibraltar. In the notorious Keppel court-martial he appeared not wholly to his credit. During the French revolutionary war he served in the Channel with distinction, having a share in 1794 in the 'glorious first of June' off Ushant, and afterwards in command of blockading squadrons. He attained flag rank in 1780, and was raised to the peerage as Baron Bridport of Cricket St Thomas, Somerset, in 1796, and Viscount Bridport in 1800. He died 3d May 1814. See the *Naval Chronicle*, vol. i.; the Rev. T. Keppel's *Life of Lord Keppel*, and Lord Bridport's *Letters*, edited by Hannay for the Navy Records Society (1895).

Hood, John Bell, an American general, was born at Owingsville, Kentucky, 1st June 1831, graduated at West Point in 1853, and saw some service against the Indians. He entered the Confederate army, commanded a brigade, and was severely wounded at Gaines's Mill, at Gettysburg, and at Chickamauga, where he lost a leg and was made lieutenant-general. He commanded a corps under General J. E. Johnston in the retreat to Atlanta, and in July 1864 succeeded him in command of the army. On September 1 he was compelled to evacuate the city, and leave the road free for Sherman's march to the sea. He yet made a bold attempt to cut Sherman's communications, and, though worsted at Franklin on November 30, pushed as far north as Nashville; but here he was again defeated by Thomas on December 16, and at his own request he was relieved of command. He died in New Orleans, 30th August 1879. His personal experiences were published posthumously as *Advance and Retreat* (1880).

Hood, Robin. See Robin Hood.

Hood, Samuel, Viscount Hood of Whitley, admiral, elder brother of Lord Bridport, was born at Thorncombe in 1724, and entered the navy in 1740 under Commodore Smith on board the *Romney*. He was promoted lieutenant in 1746, commander in 1751, [illegible] and post-captain in 1756. While in that rank he commanded the *Vestal* frigate of 32 guns, in which he took a French frigate of equal force after a bloody contested action. After much other service at sea he [illegible] of Portsmouth dockyard in 1778. In 1780 he was promoted to flag rank, and sailed almost at once in command of a squadron to reinforce the North American and West Indian stations under the orders of Rodney. He remained in these waters till peace was signed; and, as they were the great scene of the naval war, he had many opportunities of distinguishing himself. In April 1781 he fought an action with De Grasse off the Diamond Rock, and in July of the same year Rodney having gone on [illegible] Hood was left in command in the battle off the Chesapeake. In January 1782 he [illegible] in the West Indies and showed himself a tactician of the most brilliant kind by the masterly series of manœuvres by which he outwitted De Grasse in the actions fought in the Basseterre Roads off the island of St Kitts. When Rodney arrived to take command with the reinforcements from England, Hood became again his second in command. In that rank he had a conspicuous share in the winning of the decisive victory of the 12th April, commonly called the battle of Dominica. The brunt of the preliminary action of the 9th fell on his division, and on the 12th he led the rear of the English line. For his services on this occasion he was made Baron Hood of Catherington in the Irish peerage. In 1784 he stood against Fox for Westminster, and was elected. He became a Lord of the Admiralty in 1788. When the great revolutionary war broke out in 1793, he was appointed to the Mediterranean. In that position he directed the occupation of Toulon and the subsequent operations in the Gulf of Lyons and on the coast of Corsica. He hauled down his flag in 1795. In 1796 he was made Viscount Hood in the peerage of Great Britain, and he died at Bath, 27th June 1816. Lord Hood had the reputation of being a consummate tactician. Nelson, who served under him, considered him the ablest of our admirals in the early years of the war, and it is said that a plan he drew up for an attack on a French fleet at anchor, which was prevented by foul winds, had some share in inspiring the plan of attack adopted in the battle of the Nile. See *Naval Chronicle*, vol. ii. pp. 1–46; Mundy's *Rodney*; Nelson's *Letters and Despatches*; James's *Naval History*.

Hood, Thomas, poet and humorist, was born on the 23d of May 1799, at No. 31 the Poultry, in the City of London, where his father carried on the business of a publisher in partnership with a Mr Vernor. Thomas Hood the elder was a native of Scotland, the son of parents in humble circumstances, near Errol, on the north bank of the Tay, between Perth and Dundee. Originally bound apprentice to a bookseller in Dundee, he had proceeded to London, and finally became member of the firm just mentioned. He was himself a man of some turn for authorship, and even wrote a couple of novels now forgotten, so that his more distinguished son was born, as he expressed it, 'with ink in his blood.' The elder Hood married the sister of Mr Sands, an engraver of some repute, from whom Thomas Hood probably received his first impulse towards art and artistic associations. To Thomas Hood, the publisher, and his wife, were born a family of six children, two sons and four daughters, of whom Thomas was the second son. There was a tendency to consumption on the mother's side, for the malady was fatal to the elder son James and to two of the daughters, and in the sequel to Mrs Hood, and was at the root of those complicated disorders which made the life of Thomas Hood 'one long disease.' The father contracted a chill while nursing his elder son, and died after a few days' illness in 1811, when Thomas was only twelve years old, leaving the widow and remaining children in reduced circumstances.

In his [illegible] autobiography written by Hood in 1839, and published in the first series of *Hood's Own*, he tells us that he owed his earliest instruction to two maiden ladies, of the name of Hogsflesh, who had a small school in Token House Yard; that he was then sent to a suburban boarding-school (the 'Clapham Academy' of his famous Ode), and ultimately to a day-school at Clerkenwell, where his mother went to reside after her husband's death. His education, ordinarily so called, closed at this point; and after the age of thirteen or fourteen his own keen and

catholic love of reading was the foundation of that singular versatility and resource which marked both his poetic and his humorous vein. For the next two years of his life there is some uncertainty as to his pursuits. According to his own account, he was now placed, through the influence of a friend of the family, in a merchant's counting-house in the city, but his health proving unable to stand the confinement to the desk, he was shipped off to Dundee, where relations of his father were living, among whom he resided for some three years, from 1815 to 1818.

These three years were important in Hood's life. The threatened consumption was for a time warded off—the boy led the healthiest of outdoor lives in fishing and boating—he had ample leisure besides both for reading and sketching, and he began to practise his pen both in verse and prose in the pages of local newspapers and magazines. In 1818 he returned to London with his health apparently re-established, and entered the studio of his uncle, the engraver. After a short apprenticeship of only two years he began to work on his own account, until, the literary instinct beginning to wax far stronger than the graphic, he seems to have discovered where lay the true field for his genius. About the same time the *London Magazine*, losing its editor, John Scott, and passing into the hands of Taylor and Hessey, Thomas Hood, then a young man of two-and-twenty, was appointed sub-editor.

Nothing more propitious for Hood's genius could have happened. It emancipated him for ever from the engraver's desk, the drudgery and constraint of which were seriously affecting his health, and it threw him at once into a society of writers best fitted to call forth all that was best in him. He now found himself in daily companionship with such men as Procter, Cary, Allan Cunningham, De Quincey, Hazlitt, and, above all, with Charles Lamb, with whom a close friendship sprung up, destined to be one of the best influences of Hood's literary life. It was, however, the intimacy with John Hamilton Reynolds, whose sister he married three years later, that more than all the rest served to encourage and train Hood's poetic faculty. John Keats had died early in 1821, the year that Hood joined the magazine, and it does not appear that they ever met; but Reynolds had been the close friend and disciple of Keats, and Hood passed at once under the same fascinating influence. Between July 1821 and July 1823, besides other and lighter contributions to the *London*, Hood wrote and published in the magazine some of the finest of what may be called the poems of his Keatsian period. *Lycus the Centaur*, the *Two Peacocks of Bedfont*, the *Ode to Autumn*, and others—poems which have never materially increased Hood's fame with the ordinary reader, chiefly because Hood the humorist appeals to a larger audience than Hood the poet, and the world is always indisposed to allow credit to a writer for gifts of very opposite kinds. And although in the class of subjects, and in the very titles of these poems, as well as in turns of phrase and versification, the influence of Keats is unmistakable, the poems show quite as markedly the result of an ear and taste formed upon a loving study of the narrative poems of Shakespeare. And 'over all there hung' a tender melancholy observable in all Hood's serious verse, engendered in a personality on which from the beginning there rested the shadow of impending fate. In spite of real and original poetic quality, these poems, issued anonymously, failed to attract notice, and when in 1827 he produced them with others of still finer quality in book-form, the volume fell all but dead from the press.

A different fate attended an earlier venture in 1825, when Hood and his brother-in-law Reynolds published (also anonymously) the little volume entitled *Odes and Addresses to Great People*. While writing serious poetry in the *London* it had fallen to Hood's lot to act as 'comic man' or humorous chorus to the magazine, and as such to invent facetious answers to correspondents, real or imaginary. Among these he had inserted a burlesque *Ode to Dr Kitchener*, exhibiting a verbal wit of quite different flavour from the ordinary. The success of this trifle seems to have suggested a collection of similar odes, to which Reynolds contributed a few. But Hood's was far the more conspicuous share, revealing a wealth of humorous ingenuity that at once attracted notice. Coleridge wrote, attributing the book to Lamb, as the only writer he knew capable of the achievement. The book passed rapidly through three editions, and practically determined the chief occupation of Hood for the remainder of his short life. His musical melancholy verse had brought him no recognition. His first facetious efforts had gained him an audience at once. From that day forth the vein thus opened was to be worked, in health and in sickness, with the grain and against the grain, for twenty years of anxiety and struggle.

For Hood had married in 1824 contrary, it is to be feared, to all counsels of prudence. The marriage was one of truest affection, but it could hardly have been acceptable to Mrs Hood's family, for Hood had no means of support but his pen, and his health was already matter of serious anxiety. The marriage soon produced strained relations with the Reynoldses, and in the end a complete estrangement from Hood's early friend and brother-in-law. The *Odes and Addresses* were followed in 1826 by the first series of *Whims and Oddities*, where Hood first exhibited such graphic talent as he possessed (he said of himself that, like Pope's 'tapetied curtains,' he was 'never meant to draw') in these *picture-puns* of which he seems to have been the inventor. A second series of *Whims and Oddities* appeared in 1827, dedicated to Sir Walter Scott, followed without delay by two volumes of *National Tales*, the least characteristic and noticeable of Hood's writings. In 1829 he edited *The Gem*, one of the many fashionable annuals then in vogue—a remarkable little volume, for besides Charles Lamb's 'Lines on a Child dying as soon as born,' written on the death of Hood's first child, it gave to the world Hood's *Eugene Aram*, the first of his poems showing a tragic force of real individuality.

Hood and his wife, who passed the first years of their married life in Robert Street, Adelphi, left London in 1829 for a cottage at Winchmore Hill, a few miles north of the metropolis, where he schemed the first of those comic annuals which he produced yearly and single-handed from 1830 to 1839. In 1832 he left Winchmore Hill for an old-fashioned house at Wanstead, in Essex, forming part of the old historic mansion, Wanstead House, where the romantic scenery of the park and neighbourhood furnished him with a background for his one novel, *Tylney Hall*, written during the next two years, and published in three volumes in 1834—a story of a conventional melodramatic type, with an underplot of cockney life and manners, not without many touches of Hood's peculiar charm, but on the whole a failure. He never repeated the experiment of prose romance.

In 1834 the failure of a publisher plunged Hood into serious money difficulties by which he was hampered for the rest of his life. After the birth of his second child, a son, in January 1835, and the dangerous illness of Mrs Hood which followed, the family went abroad and settled for two years at Coblenz on the Rhine, and for the next three years at Ostend. During these five years Hood,

struggling against the slow progress of a fatal disease, continued to produce his *Comic Annual's* and other lighter matter, and schemed his *Up the Rhine*, a humorous account of the proceedings of an English family in Germany, told in letters, and too obviously imitated from *Humphrey Clinker*. This, when published in 1839, at once hit the public taste, but seems to have brought little profit to its author, who, apparently destitute of all business faculty, suffered throughout his career from the misfortunes or the superior sagacity of his publishers. The sufferings of Hood during these five years were very terrible, and are only hinted by his son and daughter in their memoir of their father. In an unpublished letter to his wife in April 1840, written during a temporary visit to England from the house of his generous friend, the first Charles Wentworth Dilke, he writes: 'I find my position a very cruel one—after all my struggles to be, as I am, almost moneyless, and with a very dim prospect of getting any, but by the sheer exercise of my pen. What is to be done in the meantime is a question I ask myself without any answer but—Bruges jail. At the very moment of being free of Bailey, am I tied elsewhere, hand and foot, and by sheer necessity ready to surrender myself that slave, a bookseller's hack!'

By the kindness of friends Hood was enabled to return to England, with security from his creditors, in 1840. Disease of lungs and heart was now so far advanced that the fatal issue was only a question of time, but he continued to struggle on bravely and cheerfully for five years longer. In 1841 he was offered by Colburn the editorship of the *New Monthly Magazine* at a salary of £300 a year, a post which he filled for two years, when, a difference arising with the proprietor, he resigned the editorship, and in January 1844 started a new periodical of his own, *Hood's Monthly Magazine*, destined to be his last literary venture. Meantime in the Christmas number of *Punch* (1843) had appeared the 'Song of the Shirt;' and in *Hood's Magazine*, during its brief career, there followed the 'Haunted House,' the 'Lay of the Labourer,' and the 'Bridge of Sighs,' proving that, as the darkness of his own prospects deepened, the sympathies with his kind deepened also, and quickened his finest genius. Only a few months after the starting of the magazine a notice to the subscribers had to tell that the health of the editor was rapidly failing. Towards the end of the year his friends used their interest with the government of the day, and in November Sir Robert Peel wrote announcing a pension to Mrs Hood on the civil list of £100 a year. In the number of the magazine for February 1845 appeared Hood's last contribution, the touching lines, prophetic of his approaching end, beginning:

[illegible]

and ending:

[illegible]

After three more months of increasing pain and distress, Thomas Hood died at Devonshire Lodge, Finchley Road, on the 3d of May 1845. He was buried in Kensal Green Cemetery. His devoted wife, broken in health with the long attendance on her husband, survived him only eighteen months.

Hood produced in twenty-four years an amount of prose and verse of which at least one half the world might willingly let die. Of the other half, all the serious poetry is remarkable, and a small portion of first-rate excellence. Lyrics such as the 'Song of the Shirt,' the 'Bridge of Sighs,' 'Eugene Aram,' the song beginning 'I remember, I remember, the house where I was born,' and the 'Ode to Melancholy' are of an assured immortality. His humorous verse—and in the best of it, as in 'Miss Kilmansegg,' are often blended poetry, pathos, and even real tragic power—is of a kind that Hood absolutely created. Not only was he the most prolific and successful punster that ever used that form of wit, but he turned it to purposes of which no one had ever supposed it capable. It became in his hands the most natural and obvious vehicle for all his better gifts. The truth is, he brought to it the transfiguring power of real imagination, and, instead of its degrading whatever object it touched, in his hands it ministered to the noblest ends. Even in the 'Song of the Shirt,' when his deepest sympathies were involved, he uses the pun with almost magical effect, as where the poor needlewoman, confined to her squalid garret when all nature is beckoning her forth, exclaims:

[illegible]

It was Hood's misfortune that the necessity of writing for bread compelled him to write constantly below his better genius. But he has left sufficient to found a durable fame as a writer of rare individuality, who, using a discredited method, made it delightful by the imagination of a true poet and the humanity of a genuine lover of his kind.

The best account of Hood's early life is to be found in his *Literary Reminiscences*, published in the first series of *Hood's Own*. The Memoir by his son and daughter is the chief source of information about [illegible], but is a poor and unsatisfactory book. Later, in 1885, Mr Alexander Elliot, in a modest work entitled *Hood in Scotland*, has collected from persons and documents previously unconsulted some very interesting details of Hood's early residence in Dundee, and of a second visit of a few weeks paid by him to that city not long before his death.

Hoofs. The healthy soundness of the horse's foot is mainly preserved by permitting it to grow uninjured by the rasp and knife (see HORSE-SHOEING), and kept clean by being washed with cold water; all other applications are injurious and destroy the toughness of the 'horn surface.' Softness and brittleness of the hoof, which are fruitful sources of cracks and Corns (*q.v.*), may be remedied by placing the feet for several hours daily in thick woollen swabs, kept cool and moist by frequent applications of cold water, and by encouraging a more healthy growth of horn by occasional mild blisters round the coronary band. Cracks, or sand-cracks, as they are termed, mostly occur amongst horses much upon the road, cause lameness, and constitute unsoundness. When serious and recent, poulticing, thinning away of the crust about the crack, and perfect rest are essential. After the earlier heat and tenderness are removed a hot iron should be drawn at right angles to the crack, both above and below, so as to separate the diseased from the sound horn. Waxed thread or fine wire should be wound round the hoof, and a sound growth of horn stimulated by a blister round the coronet. The horse's hoofs are too hard and coarse to be employed for the making of the better class of combs and buttons, for which purpose the hoofs of cattle, to the value of nearly £5000, are annually imported into Britain. They are, however, largely used by manufacturers of prussiate of potash and artificial manures. See FOOT.

Hooghly, or HÚGLÍ, a river of Bengal Proper, the most westerly of the channels by which the Ganges reaches the sea, and commercially the most important. Taking its distinctive name near the

town of Santipur, it has a southerly course of 64 miles to Calcutta, and a further course of 81 miles in the same direction to the Bay of Bengal. Being a deltaic river, the Hooghly is much subject to being silted up, and is only kept open to navigation by the vigilant exertions of a special staff of river engineers. Even with all their care the stream is frequently dangerous, owing to shifting quicksands and moving banks and channels. In spite of these drawbacks vessels drawing 26 feet of water are safely taken up to Calcutta by the Calcutta pilots. At its mouth the Hooghly has a width of 15 miles. The Bore (q.v.) of the river frequently attains a height of 7 vertical feet. See map at CALCUTTA.

Hooghly (*Húgli*), a city of Bengal Proper, capital of a district, stands on the right or western bank of the river Hooghly, 25 miles by rail north of Calcutta. Pop. (1891) of Hooghly with Chinsura, immediately to the south, 33,060, mostly Hindus. Here is a college for English and Asiatic literature, founded by a Hindu.

Hook. See FISH-HOOK. For the HOOK (HOEK) OF HOLLAND, see ROTTERDAM.

Hook, JAMES CLARKE, painter, was born in London on 21st November 1819, his mother being a daughter of Adam Clarke, the Biblical commentator. He entered as a student of the Royal Academy in 1836, gained the first medals in the Life and Painting Schools in 1842, and in 1845 was awarded the travelling studentship of the Royal Academy for 'Rizpah watching the Bodies of the Sons of Saul.' He returned home after a stay of eighteen months in Italy, and for some time painted scenes from Italian history and literature, mostly connected with Venice, together with some few suggested by Shakespeare's plays and the Bible. Most of these were romantic in feeling, dramatic in treatment, and brilliant in colouring. In 1850 Hook was elected an Associate of the Royal Academy, and ten years later full Academician. In the meantime he had begun to work at subjects connected with the lives of the people, more especially pieces illustrating seafaring life. His powers in this line of study, his most characteristic and his best, are illustrated by the 'Widow's Son going to Sea,' 'Ship-boy's Letter,' 'Coast-boy gathering Eggs,' 'Luff, Boy,' 'Carting for Farmer Pengelly,' 'Tickling Trout,' 'A Mermaid,' amongst many others. Mr Hook is also a skilful etcher. See the *Art Journal Annual* of 1888.

Hook, THEODORE EDWARD, prince of jack-puddings, was born in London, 22d September 1788, second son of the Vauxhall composer, James Hook (1746–1827), by his first wife, the beautiful Miss Madden, who died in 1802. His elder brother, Dr James Hook (1771–1828), became in 1802 chaplain to the Prince of Wales, in 1825 Dean of Worcester, and was himself the author of a couple of novels. Theodore's education was almost limited to a year at Harrow and matriculation at Oxford; but while yet a minor he achieved celebrity as the author of thirteen successful comic operas and melodramas (1805–11), as a punster and matchless *improvisatore*, and as a practical joker—his greatest performance the Berners Street Hoax (1809), which took in the Lord Mayor, the Duke of Gloucester, and hundreds, thousands of humbler victims. Such talents claimed recognition, and in time the 'little pet lion of the green-room' gained the *entrée* of very high society. The Prince Regent himself remarked that 'something must be done for Hook;' and in 1812 that something was found in the post, worth £2000 a year, of treasurer to the Mauritius. There Hook fared gloriously, until in 1818 a grave deficiency was detected in the public chest; he was arrested and sent, almost penniless, to England. An acquaintance, meeting him at St Helena, said, 'I hope you are not going home for your health.' 'Why,' answered Hook, 'I am sorry to say they do think there's something wrong in the chest.' Himself he ascribed the 'unfortunate defalcation' to a black clerk, who had committed suicide; anyhow, though criminal proceedings were dropped, in 1823 he was pronounced a crown debtor for £12,000, and was again sold up and arrested. In 1825 he was released from the King's Bench, but not from the debt; however, he made no effort to discharge it. Meanwhile, in 1820, he had started the Tory *John Bull*, whose chief aim was to vilify Queen Caroline, and which in its palmy days brought him fully £2000 per annum. *Sayings and Doings* (9 vols. 1824–28) yielded other £4000, and nine more three-volume novels followed between 1830 and 1839—*Maxwell*, the half-autobiographical *Gilbert Gurney*, *Jack Brag*, &c. four of them first appearing in the *New Monthly Magazine*, of which Hook was editor from 1836. So he lived for a time in great style; and even after debt drove him from St James's (1831) he still dined, diced, drank, and made sport in clubs and titled houses, whilst the woman he had betrayed, the mother of his five children, was left to the loneliness of the cottage at Fulham. Shakespeare has nothing more pitiful than Hook's words to the friend who had caught him in deshabille: 'Well, you see me as I am at last—all the bucklings, and paddings, and washings, and brushings dropped for ever—a poor old gray-haired man, with my belly about my knees.' He was only fifty-two then, and a week or two later he died, 24th August 1841. He is buried in Fulham churchyard.

See his *Life and Remains*, by the Rev. R. H. Dalton Barham (2 vols. 1849), and Lockhart's *Quarterly* article (May 1843; reprinted 1851).

Hook, WALTER FARQUHAR, ecclesiastical historian, was born in London in 1798, son of Dr James Hook, afterwards Dean of Worcester. He was educated at Winchester and Christ Church, Oxford, took orders in 1821, and, after holding some minor preferments, was appointed vicar of Leeds in 1837. Here, mainly by his energy and enthusiasm, no fewer than twenty-one new churches were built in Leeds, as well as twenty-three parsonages and twenty-seven schools, while the parish church was rebuilt at a cost of £28,000. In 1859 Hook was made Dean of Chichester by Lord Derby. His leanings towards Tractarianism brought him no little unpopularity; but throughout life he maintained a high ideal of devoted churchmanship. He died 20th October 1875. A memorial church at Leeds, which cost £25,000, and was designed by Sir G. G. Scott, was consecrated in 1880.

Dean Hook's works are *An Ecclesiastical Biography, containing the Lives of Ancient Fathers and Modern Divines* (8 vols. 1845–52); *A Church Dictionary* (8th ed. 1859); *The Cross of Christ* (1873); *The Church and its Ordinances* (4 vols. 1876); and *Archbishops of Canterbury* (12 vols. 1860–76). See his *Life and Letters*, by Dean Stephens (2 vols. 1878; new ed. 1896).

Hookah (from Arabic *huqqa*, through the Hindustani; the Persian *kalyun*; also called Nargileh, from Persian *nārgīl*), the water tobacco-pipe of Arabs, Turks, Persians, Hindus, and other orientals. It consists of a bowl for the tobacco, a water-bottle, and a long flexible tube ending in the mouthpiece. A wooden tube leads from the bottom of the head or bowl down into the water in the bottle, and the flexible tube is continued downwards by a stiff tube into the space above the water in the bottle. Thus the smoke is cooled before it reaches the mouth of the smoker. Many of these pipes are beautifully decorated, or

even encrusted with gems. The *bubble bubble* of India, named from the sound produced, is a similar but simpler water pipe, made of a cocoa-nut filled with water, and two short wooden tubes at right angles, one going into the water, the other merely passing inside the top of the shell.

Hooke, ROBERT, an English natural philosopher, born at Freshwater, Isle of Wight, July 18, 1635, and educated under Busby at Westminster, and at Christ Church, Oxford. He enjoyed the patronage of the Hon. Robert Boyle, and helped him to construct his air-pump. In 1662 he was appointed curator of experiments to the Royal Society, and in 1677 became its secretary; in 1665 professor of Geometry in Gresham College, London; and after the great fire of 1666 he acted as surveyor during the works, and thus accumulated several thousand pounds, which he hid away in an old iron chest. He died at Gresham College, March 3, 1703. Hooke was a man of extraordinary inventive genius, and has justly been considered as the greatest of philosophical mechanics; the wonderful sagacity, nay, almost intuition, he showed in deducing correct general laws from meagre premises has never before or since been equalled. There was no important invention by any philosopher of that time which was not in part anticipated by Hooke. His theory of gravitation subsequently formed part of Newton's; he anticipated the invention of the steam-engine, and the discovery of the laws of the constrained motions of planets. Among his own completed discoveries are the law of the extension and compression of elastic bodies, '*ut tensio sic vis*;' the simplest theory of the arch; the balance-spring of watches and the anchor-escapement clocks; the permanency of the temperature of boiling water. The quadrant, telescope, and microscope are also materially indebted to him. Crooked in his person, he was upright in character, although solitary and penurious in his habits. His controversies with Huygens, Hevelius, and others brought him but little credit.

Hooker, MOUNT, a peak in the Canadian Rockies, 15,690 feet high, situated on the east boundary of British Columbia.

Hooker, JOSEPH, an American general, was born at Hadley, Massachusetts, 13th November 1814, graduated at West Point in 1837, and served with distinction in the war with Mexico, gaining the brevets of captain, major, and lieutenant-colonel, and his captain's commission. In 1853 he retired from the army, and bought a farm in California; but in 1861 he offered his services to the Union government, and was at once appointed a brigadier-general of volunteers, and major-general in 1862. He commanded a division of the 3d corps in the Peninsular campaign, and won for himself, by his coolness and gallantry, the nickname of 'Fighting Joe.' In the battles of June 1862, during the famous 'change of base,' his division rendered important services; and it was his defeat of Ewell (August 27) that compelled the enemy to evacuate Manassas. Advanced to the command of the 1st corps, he gallantly carried the position on the right of the gap at South Mountain; and he opened the battle at Antietam, where he was wounded, and won his promotion to the grade of brigadier-general in the regular army. He commanded the centre grand division in Burnside's unsuccessful attack on Fredericksburg in December 1862; and in January 1863 he succeeded him in the command of the Army of the Potomac. With this force (about 120,000 men) he was confident of effecting Lee's destruction; and about the end of April, throwing a detachment of 30,000 men across the Rappahannock below Fredericksburg, he crossed at the fords above with his main body, and marched through the Wilderness to near Chancellorsville, where he awaited Lee's attack. The Confederate troops numbered barely 50,000, but the greater part of this force, under Jackson (q.v.), turned the National flank, and, attacking the rear on May 2, threw part of Hooker's army into confusion. On the following day an impetuous attack by the whole Confederate line drove Hooker from the field, and he withdrew to the north side of the river. This defeat and retreat were regarded at headquarters as inexcusable; and, in spite of his skilful management of his army when Lee invaded Pennsylvania, he was superseded by Meade before the end of June. In November, with the 20th corps, he gallantly carried Lookout Mountain, and took part in the attack on Missionary Ridge. He accompanied Sherman in his invasion of Georgia, and served till the fall of Atlanta. He was brevetted major-general in the regular army in March 1865, and in 1868, having become incapacitated by paralysis, retired with the full rank of major-general. He died 31st October 1879. Unfortunate in his one separate command, Hooker still retained too much self-esteem to be altogether a model lieutenant; yet this failing has been nearly forgotten in the memory of his personal bravery, his skill as an organiser, and his undoubtedly important services.

Hooker, SIR JOSEPH. See under HOOKER, SIR WILLIAM.

Hooker, RICHARD, the greatest of English philosophical theologians, was born in or near the city of Exeter about the end of March 1554. At an early age he showed a 'quick apprehension of many perplext parts of learning,' and through the influence of his uncle, John Hooker or Vowel (1525-1601), chamberlain of the city, was brought under the notice of Jewel, Bishop of Salisbury, and sent, partly at his expense, to his own college, that of Corpus Christi, Oxford, where Walton tells us he was admitted a clerk in 1567. After his patron's death in 1571 he was befriended by Sandys, Bishop of London, who committed his son Edwin to his care. Another pupil was George Cranmer, grand-nephew of the archbishop, and both became famous men, and remained his constant friends in later life. In his nineteenth year Hooker became scholar of his college, graduated M.A. in 1577, and was soon after admitted Fellow. His progress in learning is seen by his intimacy with Henry Saville, and by his being chosen in 1579, in the illness of the Hebrew professor, to read the lecture. Three months later Walton tells us that he was for a short time expelled by the vice-president for some forgotten college quarrel, along with his tutor and friend, Dr John Rainolds, but soon after restored. After about three years' residence he took orders, and ere long was appointed to preach at St Paul's Cross. This necessity appears to have been a severe ordeal to his modest nature, the more so that the weather proved very unfavourable for his journey; but, says Walton, 'a warm bed, and rest, and drink proper for a cold, given him by Mrs Churchman [the Shunamite at whose house the preachers were lodged], and her diligent attendance added unto it, enabled him to perform the office of the day, which was in or about the year 1581.' But the scheming widow's kindness proved too much for the simple-minded scholar. He was led into a marriage with her daughter Joan, who brought him neither beauty nor portion, was 'clownish and silly' in Wood's phrase, and, what was worse, proved both a shrew and a scold. Every reader knows Walton's account of the visit of Sandys and Cranmer to their old master at his living of Drayton-Beauchamp, in

Buckinghamshire, whither he had retired. They found him tending the sheep, his Horace in his hand, and not long after they reached the house Richard was called from their company to rock the cradle. Soon after this Hooker was transferred, at the recommendation of Archbishop Sandys, and through the influence of Whitgift, to the Mastership of the Temple, against a strong effort made to promote the afternoon reader Travers, a prominent Puritan leader. The union of the colleagues, as might have been expected, was not a happy one. Travers was the more popular preacher, if the less profound thinker, and Fuller tells us that 'the congregation in the Temple ebbed in the forenoon and flowed in the afternoon.' The sermons of Travers soon became attacks upon what he considered the latitudinarianism and errors of Hooker, and, indeed, as Fuller says pointedly elsewhere, 'the pulpit spake pure Canterbury in the morning, and Geneva in the afternoon,' a state of matters that Whitgift soon put an end to by silencing Travers. The fiery Puritan appealed to the Council with a series of set charges against Hooker's doctrine, and Hooker answered him with masterly conclusiveness and temperance. But having been drawn into this personal controversy against his inclination, he felt it to be his duty to set forth the larger question of the real fundamental basis of all church government, and to this end desired Whitgift to remove him to some quiet living, 'where I might behold God's blessing spring out of my mother earth, and eat my own bread without oppositions.' Accordingly, in 1591 he accepted the living of Boscombe, six miles from Salisbury, becoming also sub-dean and prebendary of Sarum; and here he finished four of the proposed eight books of the *Laws of Ecclesiastical Polity*, which were, however, not published till 1594 in a small closely-printed folio. The year after he removed to the living of Bishopsborne, three miles from Canterbury, where he remained till his death, unconscious of his growing fame, a parish priest of unexampled humility and devotedness. His fifth book appeared in 1597, but the author did not live to complete his work, dying about the end of the year 1600, of a cold caught in a passage by water betwixt London and Gravesend. Almost his last words were upon the 'blessed obedience and order of the angels, without which peace could not be in heaven, and, oh that it might be so on earth!' He was buried in his own church, and left his widow and four daughters behind him. Sir William Cowper, great-grandfather of the first Earl Cowper, built him a monument in Borne church, and in a poetical epitaph of his own composition applies to Hooker the famous term *judicious*, which will never be dissociated from his name.

At the time of his death the last three books were believed to be nearly complete, but if so, they were soon lost, the blame of which was laid, apparently with some justice, upon Hooker's widow and her Puritan relatives, who were supposed to abhor the theology contained in them. Some months after his death the rough drafts of the completed books that remained were reluctantly given up to the archbishop, and by him entrusted to Hooker's friend, Dr Spenser, to prepare for publication. The latter reprinted the first five books in 1604, but his further labours were interrupted, and after his appointment to be president of Corpus (1607), he entrusted the papers for transcription to a young scholar named Henry Jackson, who issued some of the *Sermons* (1612–14). But Spenser died in 1614, bequeathing the papers 'as a precious legacy' to Dr King, Bishop of London. Soon after his death in 1621 they were claimed by Abbot for Lambeth Library, where they remained till Laud's committal for high-treason, when the library was handed over first to the custody of Prynne, next of Hugh Peters. Thereafter the fate of the original papers is unknown. In 1648, as Wood tells us, but more likely in 1651, the sixth and eighth books were published at London, described as 'according to the most authentique copies,' and, indeed, we have good grounds for believing that this text is substantially genuine, being to a certain extent guaranteed to us by Bishop Andrewes and Archbishop Ussher. But, unfortunately, as Keble points out, in its present form the sixth book is an entire deviation from its subject, which should have been, according to the plan of the whole treatise, a discussion of the claim of lay elders to a share in church government, whereas about nineteen-twentieths of the whole is taken up with a series of dissertations on Primitive and Romish penance, in their several parts, confession, satisfaction, absolution. Now Hooker's discussion of lay elders would be just the part of his work most displeasing to the Puritans of his time, and the presumption is perfectly reasonable that this part of the original work was destroyed. At the same time, as Keble points out, the sixth book bears every mark of being Hooker's work, though it is not in its place as a part of the *Ecclesiastical Polity*. The seventh and eighth books, however, bear every mark of being substantially genuine; the former appeared first in 1662, in the new edition of Hooker issued by Gauden, the *soi-disant* author of the *Eikon Basilike*, and not entirely a reassuring editor. The famous Life by Walton was written for a second edition, issued in 1666, in order to correct the inaccuracies in the life provided by Gauden. Walton's account of the saintly and simple-minded theologian is one of the finest pictures in the whole range of English biography, but it should be remembered that in this case he was not sketching from life, and Keble pointed out that the super-simplicity and excessive meekness and temperance attributed to him harmonise but indifferently with the masterly intellect, the incisive irony, and keen humour that were in Hooker. All earlier editions of Hooker's works were superseded by that of Keble, published by the Clarendon Press, Oxford, in 1836, containing also Walton's Life and an exhaustive preface from his own pen. Of this work the 7th edition, revised by Dean Church and Canon Paget, was issued in three volumes in 1888. Of the first book alone there is an edition, with an admirable introduction and notes, by Dean Church (1868).

Hooker's *Laws of Ecclesiastical Polity* is the earliest great philosophical work written in the English tongue, and is a noble monument of massive prose no less than of profound thought and masterly logic. The style is neither artificial nor involved, but as well ordered and well sustained throughout as the thinking itself, while it is capable of a grave and modulated rhythm that rises at times into the region of serene yet impassioned eloquence. As a thinker he is Judicious in the highest sense of the word, and his work forms a broad and enduring foundation adequate for the church of a great nation. Its fundamental idea is that of the unity and all-embracing nature of law, considered as the manifestation and development of the divine order of the universe. The paramount law which dominates the universe is itself but the outward expression of the government of God, and is ever identical with calm and temperate reason. Reason is the criterion by which even revelation is to be distinguished as to what is eternal and immutable and what is variable according to the necessities of expediency. There is a broad distinction between natural and supernatural law, but both supplement and complete each other, both have their place in the interpretation of the ways of God to man. Authority must ever be allowed great weight in the

government of the world, but it must ever be kept in harmony and conformity with reason. A necessity of polity may be held in all churches and governments without holding any one fixed form to be necessary, for these forms are not *natural* but *positive*, and therefore alterable and subject to expediency as interpreted by temperate reason. But the eternal facts of morality are necessary and self-evident postulates of the divine government of the world, and thus rest on verities that cannot be shaken. The whole furnishes a conclusive answer to the Puritan extreme and exaggeration of the central position of Protestantism, the making of Scripture the sole guide of human conduct, which rests and depends rather on the concurrence and co-operation of all the various sources of knowledge that Divine Providence has provided for man. It is not too much to say that it is mainly to Hooker's work that Anglican theology owes the tone and the direction that it has never since entirely lost.

His first book is built on a broad foundation of first principles; his second and third form polemic corollaries to the first; and in the fourth and fifth we have his detailed defence of church discipline and ritual; while the last two contain a defence of its government and its relation to the state. The fifth book is a complete apology for the Anglican Church and its usages, stamped throughout with characteristic breadth and wisdom. Hooker maintains the high religious value of ritual interpreted by the principle of symbolism, and kept in harmony with primitive usage so as to carry with it the weight of undivided authority, yet asserts the right of the living authority within the church itself both to enact and to dispense, in order to avert anarchy and disruption. In his defence of Episcopacy in the seventh book he shelters himself behind no divine right or assumption of formal scriptural authority, but maintains its superiority as a form of church government, both from its undeniable antiquity and its practical utility in actual experience. In his eighth book Hooker discusses the question of the royal supremacy and the mutual relations of church and state. To him, as to Arnold and Stanley, church and state are merely co-extensive terms, and men owe civil duties to the whole community as a state, spiritual duties to it as a church. The royal supremacy is nothing more than the assertion of national unity and independence as against mere sacerdotal pretensions, the whole body politic under its executive head, the crown, being equally concerned in the framing of all laws affecting the church, itself considered but as a part of a greater whole. On this question modern conditions have entirely shifted the bases of discussion, and, whether rightly or wrongly, Hooker's dream of a church and state one and indivisible now seems to Englishmen little more than a devout imagination.

Hooker, THOMAS, one of the founders of Connecticut, was born at Markfield, Leicestershire, in 1586, studied at Cambridge, and became a Fellow of Emmanuel College, and was for four years a curate at Chelmsford. Ejected for nonconformity, he lived in Holland until 1633, when he went to Massachusetts, and received a charge at Cambridge. In 1636 he removed with his congregation to Connecticut, and founded the town of Hartford, where he died, 7th July 1647. Hooker was a man of great influence in New England, and published many sermons and polemical works. A selection, with a Life, was printed at Boston in 1849.

Hooker, SIR WILLIAM JACKSON, a celebrated English botanist, was born at Norwich in 1785. Of independent means from an early age, he devoted himself to natural science. His first work was a *Journal of a Tour in Iceland* in 1811, written from memory, his diaries and collections having been burned. It proved so popular that a second edition was called for in 1813. He married in 1815, and settled first at Halesworth in Suffolk, but was appointed by the crown to the chair of Botany at Glasgow University in 1820. In 1841 he was appointed director of the Royal Gardens at Kew, and his energy and enthusiasm extended it enormously. He was made K.H. in 1836. Already F.R.S. in 1810, he became later D.C.L. of Oxford, LL.D. of Glasgow, and an honorary member of most foreign scientific societies. He exercised much influence in botanical appointments and in naming naturalists to accompany exploring expeditions. His herbarium and his admirable library were given to Kew. He died August 12, 1865. His name survives in Mount Hooker in the Rocky Mountains, and in Hookeria, a natural order of mosses.

His *British Jungermanniæ* (1816); his edition of Curtis's *Flora Londinensis* (1817–28); *Musci Britannici* (1818), in conjunction with Dr T. Taylor; and *Musci Exotici* (1818–20) were his chief early works. Later books were *Exotic Flora* (1822–27); the *British Flora*, with Dr Walker Arnott (1830); *Icones Filicum*, with Dr Greville (1829–31); *Icones Plantarum* (1837–54); *Species Filicum* (1846–64); and *Filices Exoticæ* (1857–59). Yet he found time in his busy life to edit the *Botanical Magazine* (1827–65), the *London Journal of Botany* (1842–48), and the *Journal of Botany and Kew Miscellany* (1849–57).

SIR JOSEPH DALTON HOOKER, son of the preceding, and also an eminent naturalist, was born at Halesworth in Suffolk, June 30, 1817. He was educated at the High School and university of Glasgow, and graduated as M.D. there in 1839. He next joined the antarctic expedition of the *Erebus* and *Terror*, returning after a four years' absence to superintend the publication of his magistral *Flora Antarctica* (1844–47), *Flora Novæ Zelandiæ* (1853–55), and *Flora Tasmaniæ* (1860). He acted for some time as substitute for Professor Graham in the chair of Botany at Edinburgh University, was appointed in 1846 botanist to the Geological Survey of Great Britain, and next year started on a botanical expedition to the Himalayas, which occupied him for three years. His *Himalayan Journals* (1854) contains the narrative of this expedition, and the *Rhododendrons of the Sikkim-Himalaya* (1849–51) illustrates the most remarkable additions which he made to the ornamental plants of our gardens on this occasion. With Dr Thomson of the Calcutta Botanic Gardens he undertook a *Flora Indica* (vol. i. 1855), still a splendid fragment. He published later a flora of British India (1874). In 1871 he made an expedition to Morocco, ascended the Great Atlas, the summit of which had never before been reached by a European, and brought back a valuable collection of plants. His *Tour* appeared in 1878. In 1877 he accompanied Dr Asa Gray in a scientific tour through Colorado, Utah, and California.

Dr Hooker was appointed assistant-director at Kew Gardens in 1855, and on the death of his father in 1865 he succeeded him as director. He succeeded him also in those liberal ideas which have made Kew the real centre of the botanical world. He was president of the British Association meeting at Norwich in 1868, and in his much-debated address professed himself entirely an adherent of Darwin. From 1873 to 1878 he was president of the Royal Society, was made C.B. in 1869 and K.C.S.I. in 1877. He is also LL.D. of Cambridge, Dublin, Edinburgh, and Glasgow, and D.C.L. of Oxford. One of his best-known works is his useful *Students' Flora of the British Islands* (1870); his most important, the *Genera Plantarum*, in conjunction with George Bentham (3 vols. 1862–83). See an article in *Nature* (vol. xvi.).

Hooks and Eyes. These dress-fasteners were used much more largely about 1860 and for some length of time previously than they are now, owing to a change in the fashion of ladies' dresses by which buttons have to a great extent taken their place. Hooks and eyes were formerly made by hand by bending the wire of which they are formed into the proper shape with pliers. But for many years they have been made by machines, which are complex in their details. By one kind of machine the wire is first drawn off a reel, next cut to the required length, then by a sinker forced into a slot by which it is bent, and at the same time the two ends are formed by cams into the lateral loops. This is the process for an eye, but a hook requires an additional bend, and this is produced by another slot and sinker. Makers of these articles do not, however, all use the same kind of machines. See also FISH-HOOKS.

Hoole, JOHN, translator and dramatist, was born at Moorfields, London, in 1727, and at the age of seventeen became a clerk in the East India House, where he remained until 1783. He published translations of the *Jerusalem Delivered* (1763) and *Rinaldo* (1792) of Tasso, the dramas of Metastasio (1767), and the *Orlando Furioso* of Ariosto (1773–83). This last Southey speaks of as 'that vile version of Hoole's,' and Scott describes the translator himself as 'a noble transmuter of gold into lead.' His dramas were *Cyrus* (1768), *Timanthes* (1770), and *Cleonice* (1775)—all of them failures, although Johnson, who was Hoole's friend and spoke well of his verses, praises the last in a complimentary letter. Hoole died 2d April 1803. See *Anecdotes of the Life of John Hoole* (1803).

Hoop Ash. See NETTLE-TREE.

Hooper, JOHN, an English bishop and martyr, was born in Somersetshire about 1495, and educated at Merton College, Oxford, whence in 1518 he passed to a Cistercian monastery at Gloucester. The reading of Zwingli made him a Reformer, and having for some time served as chaplain to Sir Thomas Arundel he twice went, in 1539–40, for safety's sake to the Continent, and after travelling in France and Germany married and settled for three years at Zurich. In 1549 he returned to England, and became a popular preacher in London. In 1550 he was appointed Bishop of Gloucester, and for his difficulty about the oath and his objections to wearing the episcopal habit was imprisoned for some time in the Fleet. His labours as a bishop were incessant, and he wore out nature in devotion to his duty. In 1552 he received the bishopric of Worcester *in commendam*. Next year at the commencement of Mary's reign he was committed to the Fleet, and after eighteen months' imprisonment was tried for heresy and condemned to death. He was burned at the stake at Gloucester, February 9, 1555, his sufferings being much prolonged by the use of green wood. His *Early Writings* were edited by the Rev. Samuel Carr in 1843; his *Later Writings*, by the Rev. Charles Nevinson in 1852, both for the Parker Society.

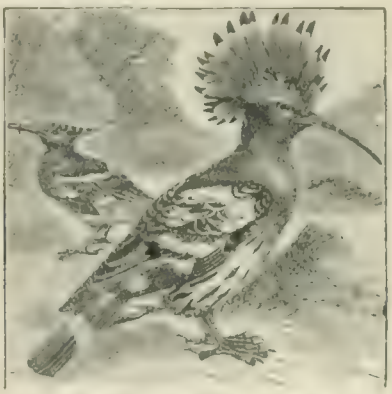
Hooping-cough (or WHOOPING-COUGH; technically, *Pertussis*) is an infectious and epidemic disease, mostly attacking children under ten, especially in spring and autumn. Its earliest symptoms, which usually appear five or six days after exposure to infection, are those of a common cold, as hoarseness, a watery discharge from the eyes and nose, oppression of the chest, a short dry cough, and more or less feverishness. This stage, which is called the *catarrhal*, lasts a week or ten days, when the fever remits, and the cough becomes more troublesome, is worse at night, and occurs in paroxysms consisting of a series of short expiratory puffs followed by a deep inspiration of air through the contracted cleft of the glottis (Larynx, q.v.), causing the characteristic 'whoop.' The attack usually terminates in the expectoration of glairy mucus or in vomiting. During the fit of coughing the face becomes red or livid, the eyes project, and the child seizes some person or object near him for support. These paroxysms occur at uncertain intervals, and between them the child returns to his play, takes his food with good appetite, and exhibits little or no sign of illness. The disease reaches its height at about the end of the fourth week, after which the paroxysms diminish in frequency, and the patient shows signs of improvement. The second stage may last from two to eight weeks, and, if no relapse occur, is succeeded by what may be termed the convalescent stage, the duration of which is very variable.

This is one of those diseases which seldom occur more than once in a lifetime; and hence it probably is that, as few children escape it, it is comparatively rarely noticed in adults. Morbid anatomy has failed to throw any direct light upon its special seat. The proportion of deaths to recoveries has not been satisfactorily determined, but when there is a severe epidemic the mortality due to this disease is often very great, the prospect being worse in the very young and in patients affected with rickets. This mortality is in reality due rather to the bronchitis, pneumonia (or inflammation of the lungs), and convulsions, which are frequent complications of hooping-cough, than to the disease itself.

The treatment of hooping-cough consists in general measures to prevent complications, and in special treatment for shortening the disease and diminishing the violence of the spasms. The child should be kept in the house with the temperature about 60° F., while quiet and the avoidance of excitement must be enforced. The diet should be simple, nutritious, and not too starchy. If the natural vomiting be not sufficient to relieve the chest and stomach of mucus an occasional emetic of ipecacuanha or sulphate of copper must be given. The bowels should be kept moderately open. In the *catarrhal* stage a simple expectorant is all that is needed, but when the whoop is developed give belladonna in large doses. Alkalies are also useful, and bromide of ammonium if nervous symptoms complicate the spasms. As hooping-cough has the characteristics of a germ disease, antiseptic inhalations and sprays seem to offer good ground for hope in shortening the malady. Stimulating liniments such as Roche's Embrocation are useful if the catarrh of the chest is severe, and in the stage of decline alum is of benefit internally. During convalescence nothing is so important as a change of air, while precautions are taken against glandular enlargements by building up the system.

Hoopoe (*Upupa*), a genus of semi-terrestrial insectivorous birds of the family Upupidæ, tribe Tenuirostres, and order Insessores, most nearly related to the Hornbills, but presenting a strong contrast to those ungainly birds by their graceful carriage, elegant figure, and beautiful crest. They are most characteristic of the Ethiopian region, but they are found in central and southern Europe and in Asia as far as Ceylon and Mongolia. The six species are most at home in desert country, where their sand-coloured plumage is a protection to them. The Common Hoopoe (*Upupa epops*) is about a foot long; its plumage exhibits a fine mixture of white, buff, and black; on the tawny-coloured head is an enormous erectile crest, the feathers of which have a black tip beyond a narrow white bar. The plumage of the female is a little paler in colour than that of the male. This bird visits Britain during the spring and autumn migration, but

seldom breeds in any part of the island. The Hoopoe derives its name from the very frequent



Common Hoopoe (*Upupa epops*).

utterance of the sound *hoo hoo hoo* which it produces, puffing out the sides of its neck and hammering on the ground with its bill at each note.

Hoops. See CRINOLINE.

Hoorn, a decaying town and seaport of North Holland, on a bay of the Zuider Zee, 27 miles NNE. of Amsterdam by rail. In the 17th century it had 20,000 inhabitants, and still it is full of antique carved houses; but, like the other 'dead cities of the Zuider Zee,' it has greatly fallen off in prosperity. There is still, however, a trade in butter and cheese. Here the large nets for herring-fishing were invented. Pop. 11,311.

Hoosac Mountain, a part of the Green Mountain range in western Massachusetts, through which is pierced the most notable railway tunnel in America. The Hoosac tunnel, which has a length of very nearly 5 miles, was commenced in 1851 for the line between Boston and Albany, was twice abandoned, and was finally opened in 1875, having cost the state of Massachusetts about $18,000,000. See TUNNEL.

Hoove, or distention of the stomachs, but particularly of the rumen or first stomach, with gas, is a common complaint among cattle and sheep, and results from the eating of food to which the animal has been unaccustomed, from wet clover or vetches, or from any easily fermentable food. Relief generally follows walking exercise, friction on the belly, and a dose of any ordinary stimulant, which for a cow may consist of a couple of ounces of turpentine, whisky, ether, or ginger, to which should also be added, in order to clear the bowels of the offending food, a laxative, such as a pint of oil or a pound of salts. A fourth or fifth of these quantities will suffice for sheep. The introduction of the probang, with the small end downwards, allows the escape of gas when there is little food in the stomach. If simple remedies fail, the breathing becomes distressed and the animal stupid; the gas may with safety be allowed to escape by an external opening made at a point intermediate between the last rib, the lumbar vertebræ, and the prominence of the haunch, either with a canula and trochar or a large pocket or table knife. For several days after an attack of hoove the digestive organs are apt to be easily deranged, and the animal must have soft and digestible food, and an occasional dose of simple laxative medicine.

The horse's bowels when distended with gases are now punctured with the best results.

Hop (*Humulus lupulus*), a perennial dioecious plant of the natural order Cannabinaceæ, the only species of its genus. It has long, rough, twining stems, and stalked 3- to 5-lobed rough leaves, and is a plant of luxuriant growth and abundant foliage. The male flowers grow in loose branching axillary panicles, and consist of five stamens surrounded by a 5-lobed perianth. The female flowers are in *strobiles*, or cones, with large persistent, concave, entire scales, which enlarge as the fruit ripens. The part of the hop so much used in brewing, and sold under the name of hops, is the ripened cone of the female plant. Female plants alone, therefore, are cultivated to any considerable extent, it being enough if a few male plants are scattered over a field.

The hop is first mentioned by Pliny as one of the garden plants of the Romans, who ate the young shoots as we eat asparagus; as, indeed, many country people in England do at the present day. It is a native of Europe and of some parts of Asia, a doubtful native of Britain and of North America. It is extensively cultivated in the south of England, the total area under hops being 66,696 acres in 1880, and 57,724 in 1880 (Kent, 35,487; Sussex, 7282; Hereford, 6850; Worcester, 2939; Hants, 2905; Surrey, 2101, &c.). Hops are also grown to a considerable extent in Germany (116,000 acres), France, Flanders, and southern Russia, and now successfully in the United States (46,800 acres in 1880; about four-fifths in western New York), and in Australia and New Zealand.

The cultivation of the hop was introduced into England from Flanders in the time of Henry VIII., but did not become sufficient for the supply of the kingdom till the end of the 17th century. For some time after hops began to be used in brewing a strong prejudice existed against the innovation;

Hop (*Humulus lupulus*).

and parliament was petitioned against hops, as 'a wicked weed, that would spoil the taste of the drink, and endanger the people.'

The hop requires deep rich soil on a dry bottom, and succeeds best in a sheltered situation with a south or south-west aspect; yet there should be a free circulation of air. The ground is generally well pulverised and manured to a considerable depth by the plough or spade before planting. The plants are usually set in stools of from three to five, a few inches apart, in rows six feet asunder, with the same space between the stools. They are obtained from cuttings or suckers taken from the

healthiest old stools, and are usually planted out somewhat closely in nursing lines for twelve months before being planted permanently. They make very little growth the first year, and not until the third year do they come to full bearing, when from four to six poles from 14 to 18 feet long are required for each stool. The most favoured timber for hop-poles is Spanish chestnut, which is extensively grown in hop-districts as coppice-wood for this purpose. The poles are set to the plants in spring before growth commences, and removed when the stalks are cut away in autumn. The plants are then dressed with manure, and the soil between the stools is stirred lightly with the fork. In Germany the poles are fewer and much taller than in England—from 23 to 27 feet high.

The cones are known to be fit to gather when they acquire a brown amber colour and firm consistence. The stalks are then cut at the base, and removed along with the poles and laid horizontally on frames of wood, to each of which is attached by tenter-hooks a large bag-like cloth into which the hops fall as they are picked by women and children, who are employed in great numbers at this work. When picked the hops are immediately conveyed to the kiln to be dried, as otherwise they are liable to heat and become spoiled in a few hours, especially when they are picked in a moist state. The operation of drying hops is similar to that of drying malt, and the kilns are of the same construction. Great care is required in drying to prevent overheating, by which the essential oil is liable to be volatilised. The hops are spread on hair-cloth from 8 to 12 inches deep, and when the ends of the stalks have become shrivelled and dry they are taken off the kiln, and laid on a wooden floor till they become quite cool, when they are put in bags or pockets.

The produce of no British crop is more precarious than that of the hop. In a good season it may be as much as 20 cwt. per acre, in a bad season none or at most perhaps 2 or 3 cwt. The plant has many enemies, both insect and fungoid parasites, which prey upon it, and destroy the crop season after season. It is calculated that on an average the hop-crop fails every five or seven years. This, in conjunction with the heavy expense of the first formation of a plantation, precludes any but those having considerable capital from taking up its cultivation. But the produce of plentiful years, if properly preserved, may be kept to meet the demand when scarcity may raise the price from £2 or £3 to £20 or £30 per cwt.; consequently to those who can wait few crops are equally profitable.

The best varieties of the hop are the Hill Golding, the East Kent Golding, Golden Hops, Jones's Hops, Grape Hops, and Farnham White Bine. The Goldings are the best and richest. The Jones's are valued for their habit of short growth, requiring shorter poles. The Colegates and Grape Hops are hardy and prolific on poorer soil than any of the others.

The fibre of the stems is employed to some extent in Sweden in the manufacture of a coarse kind of cloth, white and durable; but the fibres are so difficult of separation that the stems require to be steeped in water for a whole winter.

The fruit of the hop is a little nut, not larger than a grain of mustard-seed, and between its outer shell and the kernel there is a small quantity of a peculiar granular substance which also exists as a sort of efflorescence on the surface of the scales themselves; much of the value of the hop depends upon the abundance of this substance. It is not a mere powder, but each grain is a little organised cellular body, of an oval or round form, and, when seen under the microscope, having a reticulated surface. The powder contains some 10 per cent. of *lupuline*, the bitter principle to which hops seem to owe their tonic properties. The oil of hops is sedative, anodyne, and narcotic; the pleasantly aromatic odour has somewhat of the same qualities, hence the value of pillows stuffed with hops in cases of mania, sleeplessness, &c. The bitter principle is not narcotic, but tonic. The oil and bitter principle combine to make hops more useful than camomile, gentian, or any other bitter, in the manufacture of beer; hence the medicinal value of *extra hopped* or *bitter* beer. The tannic acid contained in the strobiles or cones of flowers also adds to the value of hops, particularly as causing the precipitation of vegetable mucilage, and consequently the clearing of beer. *Hop bitters* are used as a tonic. See also BEER.

Until the year 1862 hops paid an excise duty, and formed an important part of the revenue, although a very variable crop, owing to the serious check it is liable to from insects, fungi, diseases, and the weather. Large quantities of hops are imported into the United Kingdom for home use and for exportation to the colonies and other countries. In 1896 hops imported amounted to 207,041 cwt. of a declared value of £591,482. The annual exportation of hops is about 20,000 cwt., chiefly to Australia, Belgium, and the United States.

HOP-FLEA, or TOOTH-LEGGED BEETLE (*Phyllotreta* or *Haltica concinna*), a very small coleopterous insect, not quite one-tenth of an inch long, which often does much mischief in hop-plantations in spring, devouring the tender tops of the young shoots. It is of the same genus as the turnip-fly (*Phyllotreta nemorum*), so destructive to turnips.

HOP-FLY (*Aphis* or *Phorodon humuli*), a species of Aphis (q.v.) or plant-louse, important on account of the injury it inflicts in some seasons on the hop-plantations. The general colour is pale green, as the common name 'green fly' indicates.

Hop Aphis (*Aphis humuli*):
a, *b*, winged viviparous female and stage of larva; *c*, *d*, wingless viviparous female and larva; *e*, larva. (After Miss Ormerod.)

The males, which are winged, appear in autumn, and pair with wingless females. These lay eggs, which develop next spring into swarms of winged females. These produce partheno-genetically and viviparously great numbers of larvæ, 'lice' or 'nits,' which usually remain wingless, but rapidly mature, and soon become the virgin and viviparous parents of fresh swarms. Males and sexual reproduction reappear in autumn. Both larvæ and adults ruin the plants. No efficient method of preventing the ravages of this pest has yet been discovered; but the beneficial service to man of lady-birds and other natural foes of this fly has been long and widely recognised.

Hope, THOMAS, author and connoisseur, was born in London in 1774. While still a youth he travelled over a large portion of Europe, Asia, and Africa, and collected many drawings, chiefly of buildings and sculptures. In England he first attracted attention by the splendid decorations which he bestowed on the interior of his mansion

in Duchess Street, Portland Place, London, a description of which appeared in his book on *Household Furniture* (1805). In 1809 he published *Costume of the Ancients* and *Architecture of Theatres*, in 1812 *Modern Costumes*, and in 1819 (anonymously) *Anastasius, or Memoirs of a Modern Greek at the close of the 18th Century*. This last work is his masterpiece, and by many was ascribed to Lord Byron, who was greatly flattered by the rumour. It is certainly a brilliant and erudite performance; still it wants the dramatic *vis* of a genuine work of genius. Hope died 3d February 1831, leaving behind him a very heterodox but rather eloquent essay *On the Origin and Prospects of Man* (1831), and an *Historical Essay on Architecture* (1835).

His third son, ALEXANDER JAMES BERESFORD-HOPE, born in 1820, was educated at Harrow and Trinity College, Cambridge, where he graduated B.A. in 1841. He was twice Conservative member for Maidstone (1841–52, 1857–59), and for Cambridge University from 1868 till his death on 20th October 1887. In 1880 he was sworn a privy councillor, and in 1881 Dublin University created him an honorary LL.D. A zealous High Churchman, he was the principal founder of St Augustine's missionary college at Canterbury (q.v.), and published several works on church topics, as well as two novels, *Strathy Tod Up* (1880) and *The Brandreths* (1882). He was also a proprietor of the *Saturday Review*.

Hope-Scott, JAMES, third son of the Hon. Sir Alexander Hope, and grandson of the second Earl of Hopetoun, was born at Marlow in 1812, and from Eton proceeded to Christ Church, Oxford. He contented himself with a pass degree (1832), but got a fellowship at Merton; and, called to the bar in 1838, soon made a great parliamentary practice. In 1847 he married Miss Lockhart, on whose succession six years later to Abbotsford he assumed the additional surname of Scott; and in 1851 both he and his wife were admitted into the Roman communion. He died in London, 29th April 1873. His Life by Robert Ornsby (2 vols. 1884) is specially interesting for the glimpses it gives of men like Newman and Gladstone.

Hopital. MICHEL DE L'. See L. HOPITAL.

Hopkins. JUDE. See STEENHOLD.

Hopkins, JOHNS, was born, 19th May 1795, in Anne Arundel county, Maryland, where his parents, Quakers, gave him a fair education and the training of a farmer. At the age of seventeen, however, he went to Baltimore, there became a grocer, and in 1822 founded the house of Hopkins and Brothers. From the grocer's business he retired in 1847 with a large fortune, which he employed in banking and railway operations. In 1873 he gave property worth $4,500,000 to found a free hospital; he presented Baltimore with a public park, and he also gave over $3,000,000 to found the Johns Hopkins University in Baltimore (q.v.). He died December 24, 1873.

Hopkins. MATTHEW. See WITCHCRAFT.

Hopkins, SAMUEL, D.D., born at Waterbury, September 17, 1721, graduated at Yale College in 1741, studied theology with Jonathan Edwards, and from 1743 to 1769 was settled as pastor of Housatonnuc (now Great Barrington), Massachusetts. He then removed to Newport, where he died December 20, 1803. His vritings include a life of President Edwards, sermons, addresses, a treatise on the millennium, and his *System of Doctrines* (1793); these were republished with a memoir by Dr E. A. Park at Boston (3 vols. 1854); and an earlier edition (1805) contains some autobiographical notes. Hopkins, who is said to be the hero of Mrs Beecher Stowe's *Minister's Wooing*, was remarkable for his simplicity, devoutness, and unselfishness. Those who adopt the Hopkinsian theology are not a distinct sect, but are pretty numerous in America, in some of the Christian bodies of which the tenets are generally Calvinistic. They hold most of the Calvinistic doctrines, and even in their most extreme form, but they entirely reject the doctrine of imputation, both the imputation of Adam's sin and of Christ's righteousness. The divine efficiency extends to all acts whatsoever, and sin itself under the guidance of divine providence is merely a necessary means of the greatest good. The fundamental doctrine of the Hopkinsian system, however, is that all virtue and true holiness consist in *disinterested benevolence* (involving unconditional submission), and that all sin is *selfishness*—the self-love which leads a man to give his first regard even to his own eternal interests being condemned as sinful.

Hoppner, JOHN, R.A. (1759–1810), was born at Whitechapel of German parents. At first a chorister in the Chapel Royal, he entered the schools of the Royal Academy in 1775; and under the patronage of the Prince of Wales he became a fashionable portrait-painter and the rival of Lawrence. Elected A.R.A. in 1792 and R.A. in 1795, he has been called 'the plagiarist of Reynolds.' His paintings have suffered from his use of bad mediums; but his repute has risen, and in May 1895 a portrait by him fetched 1800 guineas.

Horace. QUINTUS HORATIUS FLACCUS, Latin poet and satirist, was born near Venusia in southern Italy, on the 8th December 65 B.C. His father was a manumitted slave, who as a collector of taxes or an auctioneer had saved enough money to buy a small estate, and thus belonged to the same class of small Italian freeholders as the parents of Virgil. Apparently Horace was an only child, and as such received an education almost beyond his father's means; who, instead of sending him to school at Venusia, took him to Rome, provided him with the dress and attendance customary among boys of the upper classes, and sent him to the best masters. At seventeen or eighteen he proceeded to Athens, then the chief school of philosophy, and one of the three great schools of oratory, to complete his education; and he was still there when the murder of Julius Cæsar, 15th March 44 B.C., rekindled the flames of civil war. In the autumn of this year Brutus, then proprætor of Macedonia, visited Athens while levying troops. Horace joined his side; and such was the scarcity of Roman officers that, though barely twenty-one and totally without military experience, he was at once given a high commission. He was present at the battle of Philippi, and joined in the general flight that followed the republican defeat; he found his way back to Italy, and apparently was not thought important enough for proscription by the triumvirate. His property, however, had been confiscated, and he found employment in the lower grade of the civil service to gain a livelihood. It was at this period that poverty, he says, drove him to make verses. His earliest were chiefly social satires and personal lampoons; but it was probably from some of his first lyrical pieces, in which he showed a new mastery of the Roman language, that he became known to Varius and Virgil, who in or about 38 B.C. introduced him to Mæcenas, the confidential minister of Octavianus, and a munificent patron of art and letters. The friendship thus formed was uninterrupted till the death of Mæcenas, to whose liberality Horace owed release from business and the gift of the celebrated farm among the Sabine hills. From this time forward his life was without marked incident. His springs and summers were generally spent at

Rome, where he enjoyed the intimacy of nearly all the most prominent men of the time, his autumns at the Sabine farm or a small villa which he possessed at Tibur; he sometimes passed the winter in the milder seaside air of Baiæ. Mæcenas introduced him to Augustus, who, according to Suetonius, offered him a place in his own household, which the poet prudently declined. But as the unrivalled lyric poet of the time Horace gradually acquired the position of poet-laureate; and his ode written to command for the celebration of the Secular Games in 17 B.C., with the official odes which followed it on the victories of Tiberius and Drusus, and on the glories of the Augustan age, mark the highest level which this kind of poetry has reached. On the 27th November 8 B.C. he died in his fifty-seventh year. Virgil had died eleven years before; Tibullus and Propertius soon after Virgil; Ovid, still a young man, was the only considerable poet whom he left behind; and with his death the great Augustan age of Latin poetry ends.

The following is the list of Horace's works, arranged according to the dates which have been most plausibly fixed by scholars. Some of the questions of Horatian chronology, however, are still at issue, and to most of the dates now to be given the word 'about' should be prefixed.

The first book of *Satires*, ten in number, his earliest publication, appeared 35 B.C. A second volume of eight satires, showing more maturity and finish than the first, was published 30 B.C.; and about the same time the small collection of lyrics in iambic and composite metres imitated from the Greek of Archilochus, which is known as the *Epodes*. In 19 B.C., at the age of forty-six, he produced his greatest work, three books of *Odes*, a small volume which represents the long labour of years, and which placed him at once in the front rank of poets. About the same time, whether before or after remains uncertain, is to be placed his incomparable volume of *Epistles*, which in grace, ease, good sense, and wit mark as high a level as the *Odes* do in terseness, melody, and exquisite finish. These two works are Horace's great achievement. The remainder of his writings demand but brief notice. They are the *Carmen Seculare* already noticed; a fourth book of *Odes*, with all the perfection in style of the others, but showing a slight decline in freshness; and three more epistles, one, that addressed to Florus, the most charming in its lively and graceful ease of all Horace's familiar writings; the other two somewhat fragmentary essays in literary criticism. One of them, generally known as the *Ars Poetica*, was perhaps left unfinished at his death.

In his youth Horace had been an aristocrat, but his choice of sides was perhaps more the result of accident and association than of conviction, and he afterwards acquiesced without great difficulty in the imperial government. His acquiescence was not at first untempered with regret; and in the *Odes* modern critics have found touches of veiled sarcasm against the new monarchy, and even a certain sympathy with the abortive conspiracy of Murena in 22 B.C. But as the empire grew stronger and the advantages which it brought became more evident—the repair of the destruction caused by the civil wars, the organisation of government, the development of agriculture and commerce, the establishment at home and abroad of the peace of Rome—his tone passes into real enthusiasm for the new order.

Horace professed himself a follower of the doctrines of Epicurus, which he took as a reasonable mean between the harshness of Stoicism and the low morality of the Cyrenaics. In his *Odes*, especially those written on public occasions, he uses, as all public men did, the language of the national religion. But both in religion and in philosophy he remains before all things a man of the world; his satire is more of manners and follies than of vice or impiety; and his excellent sense keeps him always to that 'golden mean' in which he sums up the lesson of Epicurus. As a critic he shows the same general good sense, but his criticisms do not profess to be original or to go much beneath the surface. In Greek literature he follows Alexandrian taste; in Latin he represents the tendency of his age to undervalue the earlier efforts of the native genius, and lay great stress on the technical finish of his own day.

From his own lifetime till now Horace has had a popularity unexampled in literature. A hundred generations who have learned him as schoolboys have remembered and returned to him in mature age as to a personal friend. He is one of those rare examples, like Julius Cæsar in politics, of genius which ripens late, and leaves the more enduring traces. Up to the age of thirty-five his work is still crude and tentative; afterwards it is characterised by a jewel-finish, an exquisite sense of language which weighs every word accurately and makes every word inevitable and perfect. He was not a profound thinker; his philosophy is that rather of the market-place than of the schools; he does not move among high ideals or subtle emotions. The romantic note which makes Virgil so magical and prophetic a figure at that turning-point of the world's history has no place in Horace; to gain a universal audience he offers nothing more and nothing less than what is universal to mankind. Of the common range of thought and feeling he is perfect and absolute master; and in the graver passages of the *Epistles*, as in the sad and noble cadence of his most famous *Odes*, the melancholy temper which underlay his quick and bright humour touches the deepest springs of human nature. Of his style the most perfect criticism was given in the next generation by a single phrase, *Horatii curiosa felicitas;* of no poet can it be more truly said, in the phrase of the Greek dramatist Agathon, that 'skill has an affection for luck, and luck for skill.' His poetry supplies more phrases which have become proverbial than the rest of Latin literature put together. To suggest a parallel in English literature we must unite in thought the excellences of Pope and Gray with the easy wit and cultured grace of Addison.

Horace's historical position in Latin literature is this: on the one hand he carried on and perfected the native Roman growth, satire, from the ruder essays of Lucilius, so as to make Roman life from day to day, in city and country, live anew under his pen; on the other he naturalised the metres and manner of the great Greek lyric poets from Alcæus and Sappho downwards. Before Horace Latin lyric poetry is represented almost wholly by the brilliant but technically immature poems of Catullus; after him it ceases to exist. For what he made it he claims, in a studied modesty of phrase but with a just sense of his own merits, an immortality to rival that of Rome.

EDITIONS: Horace's works are believed to have been printed for the first time in 1470 at Milan. The most important commentaries (with Latin notes) are those of Denis Lambin (1561), Bentley (1711), and Orelli and Baiter (1850-52). For ordinary students, with English notes, the most useful editions are by Macleane (1853), Yonge (1867), Wickham (vol. i. *Odes* and *Epodes*, 1874), Wilkins (*Epistles*, 1885) and Palmer (*Satires*, 1885). TRANSLATIONS: Francis, Conington (the whole), Sir Theodore Martin (*Odes* and *Satires*), Rutherfurd Clark (*Odes*). The *Life of Horace*, by Dean Milman, and Sir T. Martin's book (1870) in the 'Ancient Classics for English Readers' may also be read with advantage.

Horatii, the three brothers selected by Tullus Hostilius, king of Rome, to fight against the three brothers Curiatii, the champions of Alba Longa, when it was agreed to decide the quarrel between the two cities by the issue of single combat by three warriors chosen from either side. The legend goes that two of the Horatii were speedily slain; the remaining brother, yet unscathed, by a simulated flight, succeeded in engaging each of his wounded opponents singly, and in overcoming them all. As he entered the gate of Rome in triumph, bearing the trophies of the slain, he was met by his sister, whose beloved was one of the dead champions of Alba. She cursed his slayer, her victorious brother, and was by him thereupon stabbed to the heart. Horatius, condemned by the *duumviri* to be scourged to death, was afterwards saved by the people, and lived to destroy Alba Longa and carry its inhabitants to Rome. This story, although containing a very large admixture of mythical elements, points to the close relationship that existed between Rome and Alba Longa, as well as to the fact of an internecine struggle having taken place before the latter was incorporated in the political organisation of the former.

It was a descendant of the survivor of the three Horatii, named Horatius Cocles, who in 507 B.C., along with Titus Herminius and Spurius Lartius, formed the 'dauntless three,' who 'kept the bridge so well in the brave days of old,' against the army of Lars Porsena, king of Larium, whilst their compatriots broke down the Sublician bridge behind them. Horatius escaped by swimming the 'yellow Tiber,' was received with jubilant shouts by his fellow-citizens, and overwhelmed with honours and rewards.

Horbury, a village of the West Riding of Yorkshire, 4 miles SW. of Wakefield, manufactures woollens, worsteds, flannels, &c. Pop. 5550.

Hörde, a town of Westphalia, 2½ miles SE. of Dortmund, has large ironworks (employing more than 4000 men) and coal-mines, with iron, steel, and zinc manufactories. Pop. 16,598.

Hordein, a term that has been applied to a substance that can be extracted from barley (Lat. *hordeum*), which is merely a mixture of starch, cellulose, and a somewhat nitrogenous matter.

Common Hoarhound (*Marrubium vulgare*).

Horeb. See SINAI.

Horehound (*Marrubium*), a genus of plants of the natural order Labiatæ, having a tubular 10-ribbed calyx, with 5 or 10 spiny equal teeth, 4 stamens included in the corolla, the upper lip of the corolla erect, the lower lip 3-cleft. The species are mostly perennial, herbaceous plants, natives of the south of Europe and the East. One species, the Common or White Horehound *M. vulgare*, is a rather rare native of Britain, and is found generally throughout Europe, except in the more northern regions, growing in waste places, waysides, &c. It is frequently cultivated in gardens among collections of herbs. It is about 1 to 1½ feet high, bushy, with roundish, ovate, crenate, wrinkled leaves, and almost globose whorls of white flowers. The whole plant has a whitish appearance, from the down with which its leaves are covered. It has an aromatic but not very agreeable smell. It is tonic, stimulant, and laxative, and is much used in coughs, being a popular remedy, and a very safe and efficacious one. It was formerly also employed in affections of the womb and of the liver. It is administered in the form of an infusion, or made into a syrup with sugar, and sometimes the syrup is candied. Black Horehound is the popular name of *Ballota nigra*, another native of Britain, and belonging to the same natural order. For Water Horehound, see GYPSY-WORT.

Horizon, the circular line formed by the apparent meeting of the earth and sky; this, in astronomy, is *sensible horizon*. The *rational horizon* is the circle formed by a plane passing through the centre of the earth, parallel to the sensible horizon, and produced to meet the heavens. The *artificial horizon* is a small trough containing quicksilver, the surface of which affords a reflection of the celestial bodies. It may be used for calculating the altitude of the stars when the sea-horizon is obscured by fog or otherwise not available to the sailor determining his position. The *dip of the horizon* is the angle through which the sea-horizon appears depressed in consequence of the elevation of the spectator. The true dip of the horizon, however, is not exactly the same as its apparent depression. The apparent sea-horizon is raised above its true place by *refraction* through an angle which varies according to the state of the atmosphere and the relative temperatures of the air and water, the variation ranging from one-third to one-twenty-third of the amount of the true dip. The rule commonly employed is to diminish the true dip by about one-fourteenth of its amount to find the apparent dip.

Hormayr, JOSEPH, FREIHERR VON, historian, was born at Innsbruck, 20th January 1782. In 1803 he was appointed keeper of the state and royal archives of Austria, and in 1816 imperial historiographer. But, having conceived an unconquerable hatred of Metternich, who had caused him to be imprisoned for thirteen months upon suspicion of being concerned in a new revolt in Tyrol, Hormayr in 1828 entered the service of Bavaria, and, after four years' activity in the department for foreign affairs, was nominated minister of Bavaria to Hanover from 1832, and to the Hanse towns from 1837. From 1846 to his death on 5th October 1848 he was head of the Bavarian archives. He published several works on the history of Tyrol (including *Das Land Tirol*, 1845), an 'Austrian Plutarch,' and a general history of modern times.

Horn, a general term applied (1) to certain structures, whatever their composition, growing on the heads of oxen, sheep, giraffes, rhinoceroses, &c., and to similar structures on other animals such as beetles; (2) to a substance of a certain definite chemical composition forming 'horns,' hoofs, nails, claws, and other similar structures.

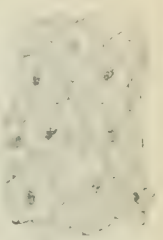
(1) Of horns as they exist among mammals there are two distinct classes: (*a*) horns formed of epidermal tissue; and (*b*) bony horns or antlers. (*a*) Epidermal horns are of two kinds. The horn of the rhinoceros, which is an example of the first kind, consists of a compact, uniform agglutination of epidermal fibres or bristles. The slightly concave base of the horn fits over a slightly-projecting roughened portion of the nasal bones underneath. In the growing horn, while the fibres at the back decay, new fibres are so added at the front and sides that, relatively to the fore-part of the head, the position of the horn remains always the same. In grown animals new material is added only at

the base, and the whole outer surface is smooth and rounded. The horn is median in position and symmetrical in shape. In the female it is usually shorter and smaller. When a second horn is present it is usually shorter and smaller in size, and is situated behind the first one and on the frontal bones. If we imagine the rough part of the bone underneath and the vascular tissue immediately over it growing upwards into the epidermal horn and hollowing it out, we have the second kind of epidermal horn—the hollow horn found in the Cavicornia (Bovidæ, Ovidæ, Antilopidæ). In the case of these horns the bony part, or horn core, is developed as an outgrowth from the frontal bone; in the Bovidæ and Ovidæ the cores are hollow or spongy, and their spaces communicate with the air-spaces in the frontal bones, while in the Antilopidæ the cores are solid or only slightly excavated at the base. Hollow horns are usually unbranched and persistent, but in the Prong-horn Antelope (*Antilocapra americana*) the horny sheaths are shed annually while the bony cores grow and their vascular coverings persist and give rise to the new horns; these horns show, after the first year, a small branch or snag analogous to the brow-antler of the deer. In the Chickara (*Antilope* [*Tetraceros*] *quadricornis*), an Indian species of antelope, two pairs of horn cores are developed from the frontal bones. The gigantic extinct antelopes Bramatherium and Sivatherium had two pairs of horns like the *Antilope quadricornis*, and the hinder pair possessed the branched character now exhibited only by the Prong-horn. Hollow horns are found usually in both sexes, but

Front View of the Skull of the Ox, with the right Horny Sheath detached from the Core.

in some genera of antelopes (Tragelaphus, Cervicapra, Cephalophus, &c.) only in the male. In the Prong-horn the horns of the female are almost hidden in the hair of the head; they are small, short, and unbranched, as in the yearling buck. (*b*) Bony horns or antlers (see ANTLERS, and DEER) are of two kinds, exemplified by the horns of the deer and giraffe respectively. In these the horns are developed from membrane bones which grow up covered by the skin, and nourished by vessels from it. In the giraffe they grow just over the junction of the frontal with the parietal bones, and become united to them by means of cartilage. The integument over the antler is terminated by a tuft of coarser hair, and is persistent. Horns are present in both sexes, and the young giraffe is the only animal born with horns. The antlers of the deer differ from those of the giraffe in that the membrane bones become firmly united by bony growth to the frontal bones, the integument—or velvet—does not persist, and the horns are shed annually.

(2) True horny tissue is a modified form of epidermic tissue. The term includes not only true horn, as noted above, but also hoofs, nails, claws, hair, wool, beaks of animals generally, the carapace of tortoises, the scales of the pangolin, the spines of the hedgehog and the quills of the porcupine, the feathers of birds, the 'castors' of horses and other animals, and other epidermic thickenings and growths, whether occurring normally as the callosities over the breastbone of camels and the hips of some monkeys or pathologically as the 'corns' and 'horns' of the human subject. This tissue largely consists of an albuminoid substance termed 'keratin,' which is composed of carbon (from 50·3 to 52·5 per cent.), hydrogen (from 6·4 to 7 per cent.), oxygen (from 20·7 to 25 per cent.), nitrogen (from 16·2 to 17·7 per cent.), and sulphur (from ·7 to 5 per cent.). Keratin may be obtained from the structures above enumerated by the successive action of boiling water, alcohol, ether, and dilute acids, and is probably a compound body that has not yet been resolved into its components. Viewed under the microscope, horny tissue is seen to consist of numerous parallel bundles of fine threads. These threads, under the action of a concentrated solution of caustic potash or soda, unfold into small plates which gradually expand into regular nucleated epidermic cells shown in the figure.



Cellular Structure of Horn.

Cattle are frequently dishorned to prevent them from constantly goring and injuring each other when confined in open courts; the whole or part only of the horn and horn core may be removed, but the usual method is total dishorning by sawing off the horns close to the head, at their junction with the skull. If the operation is skilfully performed, and if proper precautions be taken to prevent inflammation following, the operation is affirmed by many to be by no means a very painful one (much less so than many others, such as branding), the skin being the most sensitive structure involved. It should not therefore, it is argued, be considered within the category of cruelty to animals forbidden by law. In 1889, however, the Queen's Bench division decided against this view, the judges denouncing the practice as cruel and demoralising. The Scottish Court of Session in 1890 came to an opposite conclusion, which was appealed from.

HORN MANUFACTURES.—The horns of the ox, buffalo, sheep, goat, and antelope are hollow, tough, and capable of being split into flexible slices. Rhinoceros horn, though solid through nearly its whole length, resembles that of the ox in its nature. From the most remote ages the horns of animals have been employed by man for various purposes. Numerous examples of poniards, handles, pick-axes, dart-heads, 'batons of authority,' and implements of unknown use made of reindeer and red-deer horns have been found in river-gravels among other prehistoric remains of the Neolithic period. But the most remarkable of the productions of Neolithic man which have yet been found are pieces of reindeer horn and mammoth tusks with carvings or etchings of animals upon them.

Horns of the ox, as well as those of the sheep and goat, can be split up into sheets or plates after they have been soaked and boiled. When made very thin such plates were at one time used for window-panes, for the construction of lanterns, and for covering Hornbooks (q.v.). Two pieces of horn can also be welded together at the edges by steeping them in hot water and applying pressure. Another valuable property of horn is that when heated it can be pressed into a die or mould. In this way it is formed into ornamental handles for knives, forks, umbrellas, and walking-canes; also into drawer-knobs, spoons, boxes, buttons, and many other useful articles. The manufacture of combs from horn is already described under COMB.

It may be stated here that the hoofs of oxen are likewise manufactured on a large scale into combs, and to some extent into other articles such as buttons.

In their natural form, but cleaned and polished, horns are used as drinking-cups and snuff-boxes, and in past times they were very largely employed for holding gunpowder. They also served as wind-instruments. Many of the Scotch powder-horns in use during the 16th and 17th centuries are beautifully and elaborately carved. A considerable number of these are illustrated in Drummond's *Ancient Scottish Weapons* (1881). In India buffalo and other horns are used for ornamental work of various kinds. Rhinoceros horn again is a favourite material with Chinese carvers, who form the base of it into elegant cups, and sometimes make a very effective ornament of the entire horn, which admits of being very boldly carved. The deer horn so much worked up at Sheffield into handles for carving and pocket knives is chiefly that of the Axis deer (*Cervus axis*) of India. Deer horns are employed in France and Germany to decorate furniture. In Great Britain the antlers or horns of the stag, the roe, and the fallow deer—generally with the skull attached—are favourite ornaments for the decoration of entrance-halls.

The average annual imports of horns and hoofs into Great Britain at the close of the 19th century amounted to 5000 tons, valued at more than £150,000. To show the size to which some horns attain, a pair on a Cape ox measures 9 or 10 feet from tip to tip. The horns of a large-sized Indian buffalo, though curved, are about as long. They are 8 or 9 inches broad at the base, and a single horn may weigh 11 or 12 lb. See Rowland Ward's *Horns and Measurements of the Great Game of the World* (1892).

Horn, Cape, commonly spoken of as the southernmost point of America, is a steep, black, bare mountain-headland of one of the small islands of the Fuegian Archipelago, 55° 59′ S. lat., 67° 14′ W. long. It was named Hoorn, anglicised Horn, when rounded in 1616 by the Dutch navigators, Lemaire and Schouten. It was sighted by Drake in 1578. Steamers can avoid the dangerous doubling of 'the Horn' by the Strait of Magellan. See Spears, *The Gold Diggings of Cape Horn* (1896).

Horn, Count (1518–68). See Egmont, and Holland *Historic*.

Horn, French (Fr. *cor*, *cor de chasse*; Ital. *corno*, *corno da caccia*; Ger. *horn*, *waldhorn*), one of the most important, as it is the softest toned, of brass instruments used in orchestral music. Its soft and peculiar tone is due to the length of the tube, the shape of the bell, and the funnel-like bore of the mouthpiece. This latter important point will be understood from fig. 1, which shows a section of the horn mouthpiece (*a*) contrasted with that of the trumpet (*b*), the most brazen of brass instruments. The original French horn was used in hunting, and consisted of a long tube with two or three turns made large enough to go over the shoulders of the hunter. It was used from a very early period, but it was Louis XV. who composed the complete set of sounds and fanfares still used in the French hunting-field.

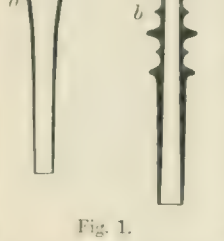


Fig. 1.

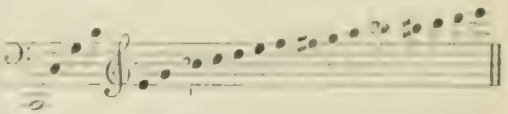
It was introduced into the orchestra in the early part of the 18th century, and it gradually acquired the important position it now holds from the smooth softness of its tones as a foundation for harmony in chords, and its fine contrast with other instruments.

For orchestral purposes the instrument was improved by the addition of crooks of varying lengths, so as to pitch it in different keys; and thus horn music is always written in C with the key added to show the crook to be used. These crooks are usually eight in number, and extend from A♯ in alto to C basso; the lowest crook making the total length of the instrument a little over 16 feet. There are also tuning crooks, raising or lowering either of the others a semitone, and also a tuning slide for the more accurate tuning with the other instruments. The open notes of the horn are the harmonics of its fundamental note (see Harmonics), and as this, from the length of the tube, is very low, the harmonics in the middle scale are at very short intervals with many consecutive notes. It may be given approximately thus:



The notes actually sounded, of course, depend on the crooks used. The method of forming the intermediate notes by hand-stopping was discovered by a player named Hampl at Dresden about 1770. The open hand, with the fingers close together, is introduced into the bell, lowering the pitch a semitone. These stopped notes, however, have a muffled sound, and in modern times the horn is almost always made with two or three valves to bridge over the intervals. Fig. 2 shows the horn

Fig. 2.

with two valves as commonly used. On account of the frequent changes of pitch, and the number and tenderness of its open notes, it is a difficult instrument to play. The horn is very seldom used singly; either two or four being the usual number in the orchestra.

Handel, Mozart, Beethoven, Schubert, Weber, Mendelssohn, Rossini, Schumann, and all composers of note have given the horns a most important place in their works. See article 'Horn' in Grove's *Dictionary of Music*.

Posthorn, a straight brass or copper instrument, varying from 2 to 4 feet in length, and somewhat resembling the bugle in its taper bore; it has a small cupped mouthpiece. It was used as a signal instrument by the guards of mail-coaches, but has occasionally been introduced into light music. It has the same open notes as the Bugle (q.v.). The hunting-horn, used in England, is a shorter instrument of the same kind. The Saxhorn (q.v.) is a different instrument.

Hornbeam (*Carpinus*), a genus of the natural order Amentaceæ, consisting of trees with compact, tough, hard wood; bark almost smooth and of a whitish-gray colour, deciduous leaves, and monœcious flowers. The male catkins are cylindrical and sessile; their flowers consist merely of a little scale-like bract and twelve to twenty-four stamens. The female catkins are slender, several inches long when in fruit, and conspicuous for their long leaf-like bracts, and containing small, ovoid, prominently

Common Hornbeam (*Carpinus betulus*):
a, male catkin; *b*, female catkin, fully developed; *c*, fruit.

ribbed nuts. The flowers appear in spring as the leaves come out. Such are the characteristics of the Common Hornbeam (*Carpinus betulus*), which is believed to be indigenous to Britain, but is best known as a plantation tree. It has a wide range of distribution on the continent of Europe.

The tree attains a height of from 30 to 80 feet—rarely the latter. The wood is white, very compact, hard, and tough, but does not now rank high commercially. It is occasionally used by joiners, turners, and wheelwrights, but, being capable of receiving a fine polish, is more in demand for purposes of ornament than utility. It was formerly in Britain, and is yet in many parts of Europe, preferred for making yokes for cattle—hence, according to some authorities, the name hornbeam. It is one of the best of firewoods, and, the leaves, like those of the beech, being persistent in winter, it is employed as a hedge plant for purposes of shelter. There are a very few other species of Carpinus natives of Europe, Asia, and North America, differing chiefly in the size and shape of the fruiting bracts.

Hornbill, the name of a genus (Buceros) and of a family (Bucerotidæ) of birds now placed in the division of Fissirostral Picarian birds. The species are numerous, and are found in Africa, India, and throughout the Malayan region as far as New Guinea. They are mostly large birds, the largest being more than 4 feet long, the smallest rather smaller than a magpie. They are bulky birds of heavy, noisy flight; their large bills are surmounted by bony crests or helmets of varied shape and sometimes of great size, but rendered light by the presence of numerous air-cells. Their food is principally fruits, but in certain circumstances they become to a great extent omnivorous. The most curious fact regarding these birds is that during the breeding season the male imprisons the female in the nest in a hollow tree, plastering up the entrance, and leaving only a small slit through which he supplies her and her offspring with food until the young ones are nearly full grown. In captivity the male bird has been observed to disgorge at intervals the lining of his gizzard in the form of a bag, and it is supposed that the food supplied to the female during her term of captivity in the breeding season is enclosed in this structure.

Hornbill (*Buceros rhinoceros*).

Hornblende, an important rock-forming mineral, having much the same composition as augite. It is considered to be an isomorphous mixture of silicate of magnesia and lime and silicate of iron and lime, combined with an aluminous silicate of lime and magnesia. It crystallises in monoclinic forms; has a hardness = 5·5 to 6; and specific gravity = 3·1 to 3·3. There are two tolerably well-marked varieties—viz. *common hornblende* and *basaltic hornblende*. Common hornblende is dark-green to raven-black, and is characteristic of many crystalline schists and plutonic rocks. It generally takes the form of long prismatic crystals, but is sometimes massive, fibrous, and radiating. Basaltic hornblende is generally brownish-black to pitch-black, and the crystals are usually short and well formed. It occurs as a primary constituent of many eruptive rocks. *Smaragdite* is a peculiar grass-green lamellar form of hornblende, characteristic of the rock Eclogite.

Hornbook, the primer or apparatus for learning the elements of reading, used in England before the days of printing, and common down to the time of George II. It consisted of a single leaf, containing on one side the alphabet large and small, in black letter or in Roman, with perhaps a small regiment of monosyllables. Then followed a form of exorcism and the Lord's Prayer, and as a finale, the Roman numerals. The leaf was usually set in a frame of wood, with a slice of transparent horn in front—hence the name of *horn*-book. There was a handle to hold it by, and usually this handle had a hole for a string, whereby the apparatus was slung to the girdle of the scholar. Sometimes the leaf was simply pasted against a slice of horn. At first the leaf was of vellum, with the characters in writing; latterly, of paper, and printed. The hornbook was prefaced and otherwise ornamented with figures of the cross, and hence came to be often called Christ Cross Row, or Criss Cross Row. Common as hornbooks at one time were, copies of them are now exceedingly rare. See the elaborate monograph by A. W. Tuer, the *History of the Horn Book*, with illustrations and fac-similes (2 vols. 1896); and Halliwell's *Fugitive Tracts* (1849). Allusions to the hornbook abound in the older writers; thus Shenstone, in his *Schoolmistress*, tells us of the children, how

> [illegible] small they take in hand,
> Which with pellucid horn secured are,
> To save from fingers wet the letters fair.

Horncastle, an ancient market-town of Lincolnshire, at the foot of the Wolds, between the confluent Bain and Waring, 21 miles E. of Lincoln,

with which it is connected by a branch line (1855). It has a handsome Perpendicular church restored 1861, a corn exchange (1856), a grammar school (1562), and a great August horse fair, to which Borrow devotes eleven chapters of the *Romany Rye*. Roman remains have been found here, and in the neighbourhood are Scrivelsby, long the seat of the Dymokes, champions of England; Winceby, the scene of a Royalist defeat (1643); Woodhall Spa, with a salt spring discovered in 1820; and the site of the Cistercian abbey of Revesby (1142). Pop. (1841) 4921; (1891) 4374. See Weir's *History of Horncastle* (1820).

Horne, Richard Henry 'Hengist,' a bright and vigorous writer, born on New year's Day 1803. He was educated at Sandhurst, but from love of adventure found his way into the Mexican naval service, and took his share in all the fighting that was going at Vera Cruz, San Juan Ulloa, and elsewhere. After passing through perils of all kinds, from yellow fever, sharks, broken ribs, shipwreck, mutiny, and fire, he reached England in safety, and plunged into a busy life of letters, writing poetry and prose alternately and with equal excellence. His famous epic *Orion* he published at the price of one farthing in 1843, to show his contempt for a public that would not buy poetry. In 1852 he went to Australia to dig for gold, and quickly became a person of consequence in the colony of Victoria; but he returned to England in 1869, dissatisfied with the government's failure to implement its obligations. He maintained the same incessant activity almost up to the close of life, his iron constitution braced by the swimming and athletic feats in which since boyhood he had been foremost. He died 13th March 1884. Among his books may be named *Exposition of the False Medium and Barriers excluding Men of Genius from the Public* (1833), *A New Spirit of the Age* (1844), in which he was helped by E. B. Browning; and *Australian Facts and Prospects* (1859); two tragedies, *Cosmo de' Medici* (1837) and *The Death of Marlowe* (1837); *Judas Iscariot, a Miracle Play* (1848); and *The Dreamer and the Worker* (1851). Mrs Browning's letters to him were collected in 1877. He took the name Hengist when in Australia.

Horne, Thomas Hartwell, biblical critic, born October 20, 1780, was educated at Christ's Hospital, and afterwards became clerk to a barrister. His leisure hours were devoted to the study of the Bible, and in 1818 he published his *Introduction to the Critical Study and Knowledge of the Holy Scriptures*, a work which procured for him admission into orders without the usual preliminaries. Subsequently, St John's College, Cambridge, granted him the degree of B.D., and the University of Pennsylvania that of D.D. In 1833 he obtained a rectory in London; and he was also made a prebendary of St Paul's Cathedral. In the course of a long life Horne published a large number of theological works, and died 27th June 1860. The *Introduction* became a very popular authority and passed through many editions: an important one was that edited in 1856 by Dr Samuel Davidson (q.v.). See the *Reminiscences of T. H. Horne*, by his daughter (1862).

Horned Screamer. See Screamer.

Horned Toad, also called Horned Frog and Horned Lizard (*Phrynosoma cornutum*), is really a lizard belonging to the Agamidæ (q.v.). It is found in Mexico, Texas, Oregon, and California.

Horned Viper. See Cerastes.

Hornellsville, a town of New York, 91 miles SE. of Buffalo by rail, with railway workshops, and manufactures of mowing machines, stoves, &c. Pop. 10,966.

Horner, Francis, was born at Edinburgh, 29th August 1778, a merchant's son of mixed English and Scottish ancestry. From the High School he passed at fourteen to the university, and, after three years there, spent two more with a clergyman in Middlesex, there to 'unlearn' his broad native dialect. On his return (1797) he was called to the Scottish bar, from which in 1802 he removed to the English; and in 1806 entered parliament as Whig member for St Ives. He had made his mark in the House as a political economist, when, at the early age of thirty-eight, he died of consumption at Pisa, 8th February 1817. There is a statue of him by Chantrey in Westminster Abbey; but himself he left little to preserve his name, beyond some contributions to the *Edinburgh Review* (q.v.), of which he was one of the founders. Yet, in Lord Cockburn's words, he was 'possessed of greater public influence than any other private man, and admired, beloved, trusted, and deplored by all except the heartless or the base.' And this, he explains, was due, not to rank, wealth, office, talents, eloquence, or fascination of manner, but merely to 'sense, industry, good principles, and a good heart—to force of character.' See *Horner's Memoir and Correspondence* (2 vols. 1843), and Cockburn's *Memorials of his Time* (1856).

Hornet (*Vespa crabro*), the largest species of wasp found in Britain. It is not uncommon in some parts of England, but is not found in Scotland. It measures about an inch in length, and is predominantly brown or brownish-red, with some yellow on head, abdomen, and wings. The insects lick the sap of trees and are very partial to sweet things, such as fruit, the secretion of aphides, &c. At times, however, they are markedly carnivorous. The females have formidable retractile stings. The nest, which is built in a hollow tree, in an outhouse, or in some other sheltered place, is composed of a coarse papery material manufactured from bark. The community of males, females, and workers is not supposed ever to include more than about 200 individuals, all of them the offspring of a single female, which, having survived the winter in some sheltered hiding-place, laid the foundation of her nest in spring. The hornet is common throughout Europe, and is represented in the United States by the Whitefaced Hornet (*V. maculata*), also a large species. See Wasp.

Hornet (*Vespa crabro*).

Horning, in Scots law. See Execution.

Hornpipe is the name of an English dance, probably named after an obsolete musical instrument. Many popular hornpipes are familiar, such as the College hornpipe, &c. Those best known are in common time.

Horn-Silver. See Silver, Photography.

Hornstone, an impure variety of flint, with a very splintery fracture.

Horn-work, in Fortification, is a capacious form of advanced work formerly much used. The head is a bastioned front, and therefore self flanking, while the sides or branches are flanked from the works in rear. If, instead of a single bastioned front, the work has two bastioned fronts, it is called a *Crown-work* (q.v.), and if three, a *counter crown-*

work. The position of these works is outside the glacis. There were good examples in the old fortifications of Strasburg. See also FORTIFICATION.

Horodenka, a town of Austria in East Galicia, 106 miles SE. of Lemberg. Pop. 10,226.

Horology (Lat. *horologium*, Gr. *horologion*, 'a sun-dial,' 'a water-clock;' Gr. *hora*, 'a season,' 'an hour,' and *-logion*, from *legein*, 'to tell;' compare Old Eng. *horologe*, Fr. *horloge*, 'a clock'), the science which treats of the construction of machines for telling the time. Although it is easy to look back to a period when time, according to the modern conception of it, as measured by hours and minutes and seconds, was unknown, yet we find progress early made in the measurement of larger periods of time, by observations of the heavenly bodies. Thus, time was early divided into years according to the apparent motion of the sun among the constellations; into months by the revolution of the moon round the earth; and into days by the alternate light and darkness caused by the rising and setting of the sun. It was long, however, before any accurate measure was found for a division of the day itself. The earliest measure employed for this purpose that we can trace is the shadow of an upright object, which gave a rough measure of time by the variations in its length and position. This suggested the invention of sun-dials (see DIAL). Another means early adopted for the measurement of short periods of time was by noting the quantity of water discharged through a small orifice in the containing vessel. Instruments for the measurement of time on this principle were called Clepsydræ (q.v.). The running of fine sand from one vessel into another was found to afford a still more certain measure, and hence the invention of the Hour-glass (q.v.). King Alfred is said to have observed the lapse of time by noting the gradual shortening of a lighted candle.

It is not very easy to trace to its source the history of the invention to which the modern clock owes its parentage, as there are many vague allusions to horologes from a very early period; but whether these were some form of water-clock or wheel-and-weight clock is uncertain. But there seems little reason to doubt that Gerbert, a distinguished Benedictine monk (afterwards Pope Sylvester II.), made a clock for Magdeburg in 996, which had a weight for motive power; and that weight-clocks began to be used in the monasteries of Europe in the 11th century; though it is probable that these only struck a bell at certain intervals as a call to prayers, and had no dial to show the time. St Paul's Cathedral had a 'clock-keeper' in 1286, and presumably a clock; and Westminster possessed one about 1290, and Canterbury Cathedral about 1292. An entry in the patent rolls of the eleventh year of Edward II. (1318) proves that Exeter Cathedral had a clock in that year, and St Albans, Glastonbury, Padua, Strasburg, and many other places possessed them in the first half of the 14th century. The St Albans clock was a famous astronomical one made by Richard de Wallingford, who was son of a blacksmith of St Albans, and afterwards became abbot there (1326–34). The clock made for Glastonbury Abbey by Peter Lightfoot, a resident monk (about 1325), was removed in the reign of Henry VIII. to Wells Cathedral, and is now preserved in South Kensington Museum; as is also an old clock from Dover Castle, bearing the date 1348, and the initials R.L. in monogram. The original great clock at Strasburg Cathedral was made in the years 1352–70 (remodelled and reconstructed in 1571–74). A clock much superior to anything preceding it was that made by Henry de Vick (or Wick) for the tower of Charles V.'s palace at Paris in 1370–79. It was said to be on the bell of this clock that the signal was given for the massacre of St Bartholomew, 1572. By successive improvements clocks have gradually developed into the beautiful pieces of mechanism of the present day. Many curious and interesting specimens, such as that of Strasburg (q.v.) (1594), Lyons Cathedral (1598), St Dunstan's, London (1671; removed to a house in Regent's Park, 1831), and many others, have an historical interest. Many curiosities of mechanism are still constructed in the name of clocks, but generally eccentricity is their only feature. Those interested in the subject will find much information in Wood's *Curiosities of Clocks and Watches* (1866).

The date when portable clocks were first made cannot be determined. They are mentioned in the beginning of the 14th century. The motive power must have been a mainspring instead of a weight. The Society of Antiquaries of England possesses one with the inscription in Bohemian that it was made at Prague by Jacob Zech in 1525. It has a spring as motive power with fusee, and is one of the oldest portable clocks in a perfect state in England.

Illuminated clock dials, to shine at night, were introduced in the first quarter of the 19th century.

Clocks are of many and various kinds—striking and non-striking—turret-clocks big enough to carry hands 6 to 10 feet long and to ring a bell to be heard at 20 miles' distance, the good old-fashioned eight-day clock with its long case, the ornamental drawing-room spring clocks, Dutch clocks, American clocks, and an infinity of others. Technically, those which strike are called *clocks*, and those which do not strike, *timepieces*, irrespective of size. But, however much they may vary in size and appearance, they are all founded on the same principle, and it will answer our present purpose to illustrate that principle in its more ordinary form of the household clock.

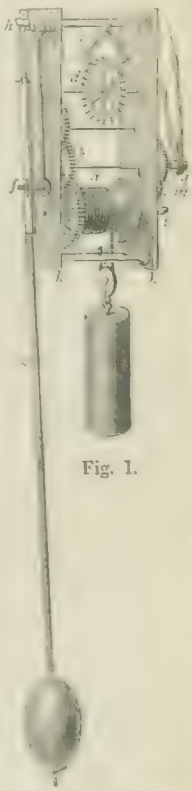


Fig. 1.

Fig. 1 represents a diagram of a non-striking timepiece. A weight, by turning a barrel, *a*, on which its cord is wound, sets in motion a train of wheels, *b*, *c*, terminating in the crown-wheel or escapement-wheel, *d*. These wheels are set between two plates which are fixed together by four pillars, one at each corner; the pillars are riveted into the back plate, *k*, and fastened with movable pins into the front plate, *k'*. The dial, removed in the fig., is also pinned on to the front plate by four short pillars or *feet*. The teeth in the pinions and wheels are so arranged in number that, while the crown-wheel revolves in 60 seconds, the centre wheel, *b*, takes an hour to do so. To regulate the speed at which the clock shall move, an arrangement called an escapement, *e* (to be afterwards more fully described), communicates by means of its *crutch* (at *f*) with the pendulum, *g*, which is suspended by a spring from the cock at *h*. The arbor of the barrel extends in a square form to the dial at *l*, where

it is wound up; a ratchet preventing its unwinding without turning the wheel with it. The hands have a separate train of wheels, called the dial or motion train, between the front plate and the dial. The arbor of the centre wheel, *b*, is produced to the dial, and on it is put the minute-wheel, revolving once an hour, with a long socket on which the minute-hand is fixed. Over this is placed a larger wheel, the hour-wheel, *l*, revolving in twelve hours, which is set in motion by the pinion of a duplicate minute-wheel, *m* (and also seen at *h*, fig. 6). The attachment of the minute-wheel to the centre-wheel arbor is, by means of a spring, enough to ensure the hands being carried round with the clock, but not enough to prevent the hands being turned, when necessary, by hand, without disturbing the interior works.

Striking-clocks have an additional train of wheels with separate weight (or spring) for the striking; it will be described further on.

Spring-clocks—i.e. clocks having a coiled spring as a motive power instead of a falling weight—have an arrangement of barrel and fusee chain similar to that of the watch, to be afterwards described. The spring is used when it is wished to save space, as the necessary fall of a weight requires a case deep enough to hold it, something about 4 feet for an eight-day clock. Their size also necessitates a short pendulum, which, of course, does not indicate seconds.

Previous to the invention of the pendulum, the regulating apparatus was generally as shown in fig. 2, which represents part of De Vick's clock already mentioned. The teeth of the escapement-wheel, I, acting on the two pallets, *h*, *i*, attached to the upright spindle or arbor, KM, to which is fixed the balance, LL, gave to the latter an alternate or vibrating motion, which was regulated by two small weights, *m*, *m*. The further these weights were moved from the centre, the more they retarded the movement; and, by means of numerous notches, their position could be shifted till the proper speed was secured.

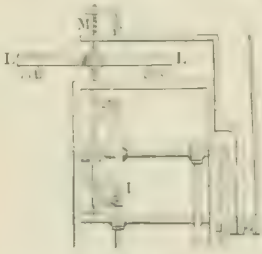

Fig. 2.

The great epoch in the history of horology was the introduction of the Pendulum (q.v.) as a regulating power. This has generally been attributed to Huygens, a Dutch philosopher, who was undoubtedly the first to bring it into practical use (1657). The fact of the actual invention, however, is obscure, and Sir E. Beckett says: 'The first pendulum clock was made for St Paul's church, in Covent Garden, by Harris, a London clock-maker, in 1621, though the credit of the invention was claimed also by Huygens himself, and by Galileo's son, and Avicenna, and the celebrated Dr Hooke.' In adapting the pendulum to the clocks previously existing Huygens had only to add a new wheel and pinion to the movement, to enable him to place the crown-wheel and spindle in a horizontal instead of a perpendicular position, so that the balance, instead of being horizontal as in De Vick's clock, should be perpendicular and extended downwards, forming a pendulum at one end.

The principle of construction adopted by Huygens, from the peculiar action of the levers and spindle, required a light pendulum and great arcs of oscillation; and it was consequently said that 'Huygens's clock governed the pendulum, whereas the pendulum ought to govern the clock.' About ten years afterwards the celebrated Dr Hooke invented an escapement which enabled a less maintaining power to impel a heavier pendulum. The pendulum, too, making smaller arcs of vibration, was less resisted by the air, and therefore performed its motion with greater regularity. This device is called the *anchor* escapement. It was brought by Hooke before the notice of the Royal Society in 1666; and was practically introduced into the art of clock-making by Clement, a London clock-maker, in 1680. It is the escapement still most usually employed in ordinary English clocks. Fig. 3 represents the more modern form of the anchor or recoil escapement: A, its axis; BC, the pallets; and D, the escapement-wheel revolving in the direction of the arrow. The connection between the pendulum and escapement may be seen in fig. 1. When the pendulum swings to the right AC rises, and a tooth escapes from C, while another falls on the outside of B, and, owing to the form of the pallet B, the train goes back during the remainder of the swing. The same thing occurs on the pendulum's return: the arm AB rises, a tooth escapes from B, and another falls on the inside of C and backs the wheelwork as before. As each of the thirty teeth of the wheel thus acts twice on the pallets, at B and again at C, it follows that a hand fixed on its arbor will move forward $\frac{1}{30}$th of a circle with each vibration of the pendulum and mark seconds on the dial. At each contact the onward pressure of the wheel gives an impulse to the pendulum, communicated through the crutch, sufficient to counteract the retarding effects of the resistance of the air and friction, which would otherwise bring it to a standstill. The length of a pendulum oscillating seconds is, for the latitude of London, about 39·14 inches.

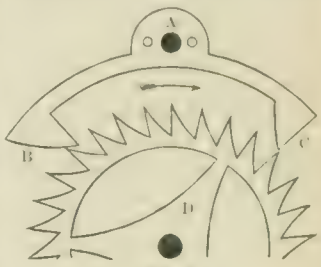

Fig. 3.

The defect of Hooke's escapement is the recoil, and various modifications have been devised to obviate this. The first and most successful was made by George Graham, an English watch-maker, in the beginning of the 18th century, and his improved form is called the *dead-beat* escapement (fig. 4). There the outer surface of B and inner surface of C are arcs of circles whose centre is A, and a little consideration will show that there can be no recoil. This escapement is adopted in time-keepers when great accuracy is required.

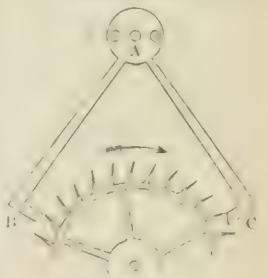

Fig. 4.

Many other escapements for clocks have been devised; but no one seems to have met with general favour except a certain form of *remontoire* or *gravity* escapement. The form of it shown in fig. 5 is called the *double three-legged escapement*, and was invented for the great clock at Westminster, in 1854, by E. B. Denison (afterwards Sir E. Beckett, Q.C.). In this clock the pendulum is 13 feet ½ inch long, to vibrate in two seconds, and its bob weighs 6 cwt. The escapement consists of two gravity impulse pallets, AB and AC,

moving on pivots at A. The escape-wheel consists of two three-legged wheels, *abc* and *def*, squared on one arbor a little distance apart, with three lifting pins (or three-leaved pinion) fixed between them. The three pins are shown by the three dots in the centre of the fig. The legs of the wheels are generally arranged alternately as in the fig. The pallets, with their arms *g* and *h*, lie between the wheels; at C is a block to lock the legs *abc*, and at B, on the other side, and of course acting in the reverse direction, is another to lock the legs *def*. The leg *a* is, in the fig., locked on the block at C. The pendulum, part of which is removed to show the escape-wheel, is supposed to be moving in the direction of the arrow, and has received impulse from the falling pallet AB at *l*; it is just beginning to touch the other pallet at *k*, which has been kept in position clear of the pendulum by one of the centre pins bearing on the arm *g*. The pendulum before turning again moves the pallet AC just enough to allow the leg *a* to escape from the locking-block at C; the wheel flies round, impelled by the clock-weight, till the leg *f* locks on the block at B; by the same movement the pin which is seen near the end of the arm *h* pushes the pallet AB away from the pendulum, which now gets impulse from the fall of the pallet AC. This goes on at each side alternately, the pallets being raised by the clock train, the pendulum only unlocking them. To make the motion go smoothly and prevent jar, a fly is attached to the arbor of the escape-wheel by a spring; it is seen in the figure. As the height to which the pallets are lifted is the same, however unequal the force communicated by the train may be, the arc of vibration of the pendulum remains constant, as the weight of the arm and the distance it falls are always the same.

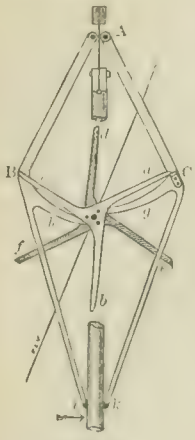

Fig. 5.

The gradual perfection of the clock required also improvements in the regulating power which finally resulted in the compensation pendulum (see PENDULUM).

The improvements in the escapement and the pendulum bring the mechanical perfection of the clock, as a time-keeping instrument, to the point which it has attained at the present day. But the art of horology would be incomplete unless there were some standard, independent of individual mechanical contrivances, by which the errors of each may be corrected. This standard is supplied by observatories, and the methods by which time is determined belong to the details of practical astronomy. There are in most parts of the United Kingdom now sufficient opportunities of setting clocks by a communication more or less direct with these establishments. When these are not to be had the sun-dial may still be used with advantage as a means of approximation to the correct time. The time which a clock ought to mark is *mean time*, the definition of which will be found in the articles DAY and TIME. The *mean time* at any place depends on the longitude. Supposing a clock to be set to Greenwich mean time, a clock keeping mean time of any place will be 4 minutes faster for every degree of longitude east of Greenwich, and 4 minutes slower for every degree west. Since the introduction of railways, clocks are usually set within Great Britain to Greenwich mean time. In the United States, where the extent of country makes it unadvisable to use the mean time of one meridian, four standard meridians were adopted in 1883—viz. 75°, 90°, 105°, 120° west of Greenwich. Clocks showing 'Eastern,' 'Central,' 'Mountain,' and 'Pacific' time are therefore respectively five, six, seven, or eight hours slower than Greenwich mean time.

For the more ready transmission of correct time to the public there is at Greenwich Observatory, as well as some others, a ball which is dropped by means of electricity precisely at one o'clock. Several attempts have been made to keep the public clocks of a town in perfect agreement with the mean-time clock in the observatory. One means of effecting this was by an electric connection and a modification of Bain's electric pendulum (1840), by Mr R. L. Jones of Chester (1857), on the suggestion of Mr Hartnup, the astronomer of the Liverpool Observatory. For a description, see ELECTRIC CLOCK. A clock in the castle of Edinburgh, by whose mechanism a gun is fired precisely at one o'clock every day, is controlled by the mean-time clock in the observatory on the Calton Hill.

It is not known when the alarum or when the striking-mechanism of the clock was first applied. The first striking-clock probably announced the hour by a single blow, as they still do in churches to avoid noise. During the 17th century there existed a great taste for striking-clocks, and hence a great variety of them. Several of Tompion's (died 1713) clocks not only struck the quarters on eight bells, but also the hour after each quarter.

The striking part of a clock (see fig. 6, which shows an English striking-clock by Ellicott, taken

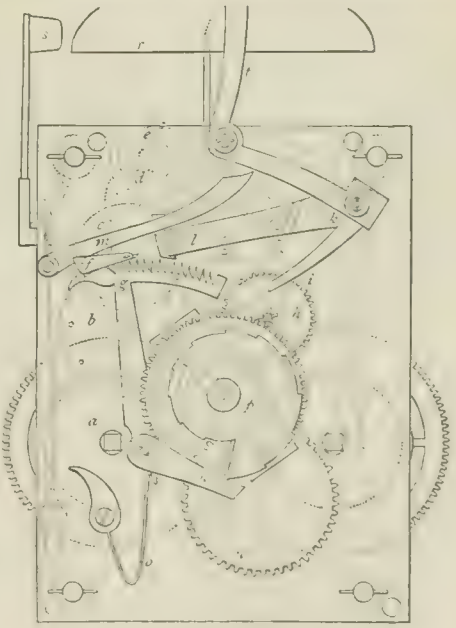

Fig. 6.

from the engraving in Moinet's work) is a peculiar and intricate piece of mechanism. The motive power is a weight used in a similar manner to that in the time-keeping train shown in fig. 1. In fig. 6, *a*, *b*, *c*, *d*, *e* are the striking-train; *e* is a fly which acts as a drag to prevent the striking being too rapid. The striking-train is kept in a normal condition of rest by the tumbler or gathering pallet

f, fixed to the prolonged arbor of the wheel *c*, being caught by the pin at the end of the rack *q*. A few minutes before the hour, a pin on the wheel, *k*, of the dial train, raises the arm, *e*, of the lifter *e*, *f*, *l*, which in turn lifts the lever *m*, which has by means of its hook been holding the rack, *q*, fixed. The tail end, *n*, of the rack is then forced by the spring *o* against the snail *p*. The snail is attached to the hour wheel of the dial train (see fig. 1), and consequently revolves in twelve hours, and has a step for every hour. The rack, in falling on it, is freed to the extent of a tooth (i.e. a tooth gets past the hook at *m*) for every step of the snail. As shown in the fig., one tooth would be freed, and the result would be that the clock would strike one; when the last step of the snail is reached, twelve would be struck. The result of this movement is that the striking-train moves a little till a pin on the wheel *d* catches on the end of the lifter *l*, which is turned down through a hole in the plate for the purpose. The resulting sound is called 'warning.' Precisely at the hour the pin on the wheel *h* slips past the end, *i*, of the lifter, which falls, relieving the striking-train; the hours are struck on the bell *r*, by the hammer *s*, acted on by the pins on the wheel *b*. As the tumbler attached to the wheel *c* revolves once for every stroke of the bell, it *gathers* up a notch of the rack at each revolution, until it is stopped by a return to its original position of rest at the pin on the rack *q*. The rack, lever, and lifting-piece are *above* the front plate, and are pivoted on studs fixed into it. A lever, *t*, moved by a pointer on the dial, throws the striking work out of gear when the clock is required to be silent. In the fig. *u* is an extra wheel for driving a hand to show the days of the month.

Clocks which chime the quarters and half-hours have generally a third train of wheels for the chiming.

In England clocks are principally made in London and Handsworth near Birmingham, though there are many small local makers. Many of the ornamental clocks and timepieces are manufactured in France.

Dutch or *wooden clocks* were first introduced about the middle of the 17th century. Though made on the same principle as ordinary clocks, their arrangements are much simplified, and their principal parts made of wood and wire, only the actual wheels being brass. They are very cheap, and consequently became very common in lower-class households and kitchens. They are made in the Black Forest in Germany, and, considering their mode of manufacture, are wonderfully accurate as timekeepers when properly taken care of.

They are now rapidly being superseded by *American clocks*, which, on account of their cheapness, neatness, and portability, have become very popular. Their manufacture is a great industry in the United States, at Waterbury in Connecticut, Brooklyn, New York, and many other places. The wheels and plates are stamped, and very little manual labour is spent on them, every part being interchangeable in similar-sized clocks. Their appearance is too familiar to require a detailed description. To many of these cheap clocks alarums are fitted, which can be set to sound at any hour. See ALARM.

Watches.—The modern perfect watch and chronometer may be said to be the result of a gradual development from the early clock rather than that of any particular invention. The first step was obviously to find some other form of power than the weight; and this was made in the end of the 15th century by the invention of the coiled spring as a motive power, but where, or by whom, is uncertain.

It seems to be taken for granted that Peter Hele, a mechanician of Nuremberg, as early as 1490 made small pocket clocks of steel which showed and struck the hours, and were driven by a coiled spring. These from their oval shape were called Nuremberg eggs. The next step was the invention of the fusee, an arrangement to overcome the weakening of the spring as it became uncoiled. This also is involved in obscurity, though it must have occurred early in the 16th century, as the clock mentioned as made by Jacob Zech in 1525 has that modification. At first a gut cord was used, the chain being a modern invention. The balance used was exactly like that of De Vick's clock (fig. 2), except that the weights on the arms of it were fixed instead of hanging. The next step of any consequence was the invention of the balance-spring by Dr Hooke in 1658–60, which was the foundation of all the varied improvements resulting in the almost perfect chronometer compensation-balance of the present day.

Although watches were introduced into England in Henry VIII.'s time, they did not come into general use till the reign of Elizabeth, and then their cost confined them to the wealthy. At first they were very large, on account of their striking part; and their cases, without glass, were pierced with elaborate open work to let out the sound of the bell. When the striking work was dispensed with, they of course became much smaller, and gradually drifted into being ornamental rather than useful. They were richly ornamented with pictures in enamel, set in the heads of walking-sticks, in bracelets, in finger-rings, and enriched with the most costly jewels. They were encased in crystal and in imitation skulls, and in fact became subject to all the vicissitudes of fashion, through which it would be needless for us to follow them. The curious will find much entertaining matter in Wood's work already referred to. Previous to the invention of the balance-spring, watches (as also clocks) had only one hand, which showed the hours; but after that event the greater power of regulating the motion led to the introduction of extra wheels to carry minute, and finally seconds, hands.

The watch is essentially a miniature edition of the ordinary spring-clock, except in two points—viz. that it has a balance-spring instead of a short pendulum, and that, as the escapement-wheel revolves in about six seconds, an extra wheel revolving in a minute is introduced to carry the seconds hand.

The train of an ordinary verge watch is shown in fig. 7: *a* is the barrel enclosing the mainspring and turning, by means of the fusee chain *b*, the fusee and great wheel *c*, and, through the pinions and wheels *d*, *e*, *f*, the escape wheel *g*. The hands

Fig. 7.

or motion train are exactly as described for clocks, and are similarly carried by the elongated arbor of the centre-wheel *d*. As will be seen in the fig., the fusee is of a peculiar shape. The reason is as follows: When the chain, which is fixed at the broadest part of the fusee, is fully wound up, it goes from the narrow part to the barrel where the other

end is fixed, and of course the spring is also fully wound. At this point the spring is strongest: and, pulling upon the narrow end of the fusee, has the least leverage. As it gradually unwinds, and at the same time becomes weaker, the leverage, owing to the shape of the fusee, becomes in exactly the same ratio greater, and thus the power on the machinery is equalised till the whole chain is unwound. The spring is wound up by the squared arbor, *m*, of the fusee through an opening in the inside case; the arbor of the spring-barrel being of course fixed. An ingenious stop arrangement prevents the possibility of damage by over-winding. The mainspring is a thin ribbon of finely tempered steel (fig. 8). The inner end is hooked on to a catch on the arbor of the barrel round which it is coiled, and the outer end to a catch on the inside of the rim of the barrel. In the American watches, now so common, the fusee is dispensed with, and the great wheel is on the barrel and directly gives the motion. In recent years this form is also used in almost all keyless watches. The verge escapement shown in fig. 7 is exactly the same as that shown in De Vick's clock (fig. 2). Two pallets, *h*, *i*, moved alternately in opposite directions by the teeth of the escapement-wheel, cause a vibrating motion in the balance *k*, which is steadied and regulated by the balance-spring *l*. The balance and spring are shown in plan in fig. 9: *a* is the balance and *b* the spring, which is arranged spirally. The inner end is fixed to the staff of the balance, the outer to a stud *c*, fixed to the watch-plate. Its beautifully delicate motion may be observed in any watch, as all watches have the spiral spring except chronometers, which have a cylindrically coiled spring instead. The length of the balance-spring in proportion to the weight of the balance is an important factor in regularity of motion, and for minute adjustment an instrument, *d*, *e*, called a *regulator* is attached to it. Two curb-pins at *d* enclose the outer coil of the spring, and, in the case of the watch going fast, a movement to the left lengthens the spring and retards the speed in proportion. For too slow a motion a movement to the right will shorten the spring and quicken it.

Fig. 8.

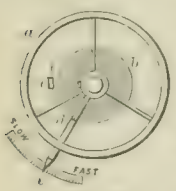

Fig. 9.

The principle involved in the clock-pendulum and watch-balance alike is that by their regularity of movement they shall keep the mechanism from going either too fast or too slow, and that in return the mechanism shall give repeated impulses sufficient to keep them perpetually in motion.

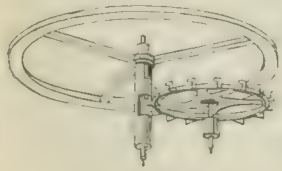

Fig. 10.

As the vertical or verge escapement, owing to the recoil of the escape-wheel and other causes, is not to be depended on for very great accuracy, attempts were immediately made after the invention of the balance-spring to devise some form of escapement which would give better results. Hooke, Huygens, Hautefeuille, and Tompion introduced improvements, but the first to succeed was made by George Graham, the inventor of the dead-beat escapement in clocks. This is called the *horizontal* or *cylinder* escapement (fig. 10). It was introduced in the beginning of the 18th century, and it is still the escapement used in many foreign watches. The impulse is given to a hollow cut in the cylindrical axis of the balance by teeth of a peculiar form projecting from a horizontal crown-wheel.

Other forms of escapement in high estimation are the *lever*, the *duplex*, and the *chronometer* '*spring-detent*' escapement. The lever escapement (invented about 1770 by Thomas Mudge) is the dead-beat escapement (see fig. 4) adapted to the altered conditions of a watch. Fig. 11 shows the form used in most modern English watches. The pallets, P, P, are fixed to a lever, A (pivoted at F), and there is an impulse pin, B (usually a piece of ruby), set in a small disc, C (called the roller), on the axis of the balance.

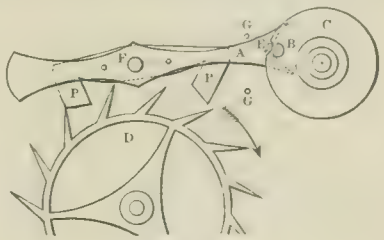

Fig. 11.

The ruby pin works into a notch at the end of the lever, and the pin and notch are so adjusted that when a tooth of the escape-wheel D leaves the pallet the pin slips out of the notch, and the balance is detached from the lever during the remainder of its swing; whence the name *detached* lever escapement, originally applied to this arrangement. On the balance returning, the pin again enters the notch, moving the lever just enough to allow the tooth next in order to escape from the dead face of the pallet on to the impulse face; then the escape-wheel acts upon the lever and balance; the tooth escapes, and another drops upon the dead face of the pallet, the pin at the same time passing out of the notch in the other direction, leaving the balance again free. This arrangement is found to give great accuracy and steadiness of performance. A safety pin, E, on the lever, prevents the wheel being unlocked, except when the impulse-pin is in the notch of the lever. Two *banking-pins*, GG, keep the motion of the lever within the desired limits.

In the duplex escapement (invented about 1780) the escape-wheel has two sets of teeth, hence the name. One set, something like the lever-wheel (fig. 11), lock the wheel by pressing on the balance staff, and the other, standing up from the side of the rim of the wheel, give impulse to the balance. It is rarely used now.

The chronometer spring-detent escapement was invented in principle by Le Roy about 1765, and perfected by Earnshaw (who also invented the cylindrical balance-spring) and Arnold about 1780. It is shown in fig. 12; *a* is the escape-wheel, which has fifteen teeth; *b*, the impulse-roller, fixed on the same staff as the balance; *c*, the impulse-pallet; *d*, discharge-pallet; *e*, locking-pallet—all the pallets are of ruby or sapphire; *f*, the blade of the detent fixed at *k* by its spring *g*; and *h*, the gold-spring. In the fig. a tooth of the escape-wheel is caught on the locking-pallet; the discharge-pallet (carried round by the roller in the direction of the arrow), by pressing on the end of the gold-spring, which in turn presses on the horn of the detent *i*, bends the detent enough to allow the tooth to escape from the pallet. The

escape wheel, being released, overtakes the impulse-pallet and drives it on till their paths diverge and they separate. The wheel is again brought to a

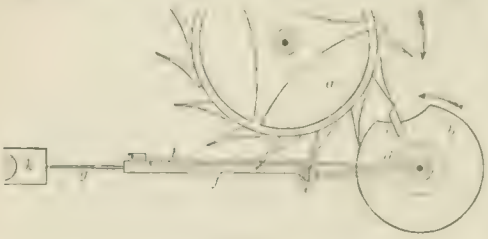

Fig. 12.

stand by the locking pallet of the detent, which, on being released by the discharge pallet, has sprung back to its original position. The roller, having made its vibration, is brought back by the spring. In the return the discharge-pallet forces itself past the end of the gold-spring, the impulse-pallet clears the teeth of the escape wheel, and the balance goes on till the momentum is exhausted, when the spring induces another vibration, the wheel is again unlocked, and the impulse-pallet gets another blow. By receiving impulse in one direction and unlocking at every alternate vibration only, the chronometer-balance is more thoroughly detached than any other. It is very delicate, however, and, though the most perfect known, it cannot stand rough usage, and is not so suitable for ordinary pocket-watches as a good lever. At sea the chronometer is hung in Gimbals (q.v.), so as to be always horizontal whatever the motion of the vessel.

In watches, even more than in clocks, variations of temperature, unless provided for, produce variations in the rate of going. A rise in the temperature makes the balance expand, and therefore augments its moment of inertia. It diminishes the elasticity of the spring; and the time of vibration of the balance, which depends upon the moment of inertia directly, and upon the elastic force of the spring inversely, is increased—the watch, that is, goes more slowly. A fall in the temperature is attended by opposite results, the watch going more rapidly than before. Compensation can obviously be made in either of two ways by an expedient for shortening the effective length of the balance-spring as the temperature rises, so as to increase the elastic force of the spring; or by an expedient for diminishing the moment of inertia of the balance as the temperature rises, so as to correspond to the diminution of the force of the spring. The first method was that made use of by John Harrison (q.v.) in his chronometer, and

Fig. 13.

it depended on a laminated bar of brass and steel fixed at one end, called a *compensation curb;* the free end carries two curb pins, which embrace the balance-spring, and, as the bar shrinks and expands, regulate the length of the spring. It is never used now. An adaptation of the other method, invented in 1782 by John Arnold, and improved by Thomas Earnshaw, is that which is always employed now. Fig. 13 shows the form employed for marine chronometers, and fig. 14 that for pocket chronometers and watches: t, a, t' (fig. 13) is the main bar of the balance, and t, b, t', b' are two compound bars, of which the outer part is of brass and the inner part of steel, carrying weights, c, c', whose position may be shifted to or from the fixed end, according as the compensation is found on trial to be less or more than is desired. Brass expands more with heat and contracts more with cold than steel; consequently, as the temperature rises the bars with their weights, being fixed at one end to the main bar, bend inwards at the free end, and so the moment of inertia of the balance is diminished; as it falls they bend outwards, and the moment of inertia is increased; and of course the diminution or the increase must be made exactly to correspond to the diminution or increase in the force of the spring. The screws, d, d, fitted to the fixed end of each of the compound bars are used for bringing the chronometer to time; sometimes the smaller ones are dispensed with. In fig. 14 the principle is the same: a, a, a, a are the time screws (equally distributed in the watch-balance); the others are for compensation, and their positions may be shifted or larger ones substituted if necessary.

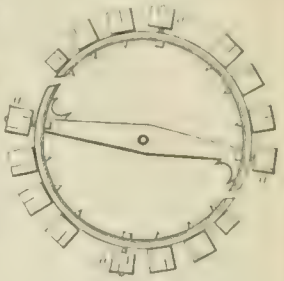

Fig. 14.

The modern marine chronometer is just a large watch fitted with all the contrivances which experience has shown to be conducive to accurate time-keeping—e.g. the cylindrical balance-spring, the detached spring-detent escapement, and the compensation-balance. Harrison's chronometer, mentioned above, was the first, and was completed after many years of study in 1736. For a description, see *British Horological Journal*, vol. xx. page 120. After many trials and improvements, and two test voyages to America, undertaken for the satisfaction of the commissioners, the last of which was completed on the 18th September 1764, the reward of £20,000, which had been offered by government for the best time-keeper for ascertaining the longitude at sea, was finally awarded to him. Harrison made many other inventions and improvements in clocks and watches, including his maintaining spring to the fusee, to keep the works going while being wound; a form of remontoire escapement, &c.

Somewhat later than this several excellent chronometers were produced in France by Berthoud and Le Roy, to the latter of whom was awarded the prize by the Académie Royale des Sciences. Progress was still made in England by Mudge, Arnold, and Earnshaw, to whom prizes were awarded by the Board of Longitude. The subsequent progress of watch-making has been chiefly directed to the construction of pocket-watches on the principle of marine chronometers, and such accuracy has been obtained that the average error is reduced to one second a day.

The compensation of an ordinary balance chronometer cannot be made perfectly accurate for all degrees of temperature, but only for two points. The explanation of this lies in the fact that, while the variations of elastic force in the spring go on uniformly in proportion to the rise or fall of the temperature, the inertia of the balance varies, not

inversely as the distance of its weights from the centre, but inversely as the *square* of the distance of the centre of gyration from the centre of motion.

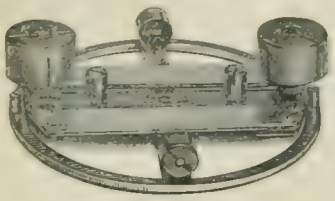

Fig. 15.

The particular points in the case of any chronometer are matter of adjustment. For instance, one chronometer may be made to go accurately in a temperature of 40°, and also in a temperature of 80°, at other temperatures being not so accurate; another chronometer to go accurately at a temperature of 20° and 60°. It is manifest that the former would be adapted to voyages in a warmer, the latter to voyages in a colder climate. To more fully adjust the compensation certain pieces are fixed to the balance to act in heat or in cold, and this is called auxiliary compensation, and there are at least two or three balances invented of recent years, one of which is shown in fig. 15, which are practically self-adjusting for the ordinary range of temperatures to which marine chronometers are subjected. The solution of the problem seems to be in setting the laminæ flat instead of vertical, and making the bar also bimetallic.

Apparatus for testing chronometers have been long in use in the observatories at Greenwich and Liverpool. In the latter there is now an extensive apparatus for this purpose, devised by the ingenious astronomer, Mr Hartnup. In a room which is isolated from noise and changes of temperature the chronometers are arranged on a frame under a glass case, so contrived that they may be subjected in turn to any given degree of temperature. The rate of each under the different temperatures is observed and noted, and the chronometers registered accordingly.

A large proportion of modern watches are made to wind and to set the hands from the pendant. Fig. 16 shows the form of keyless work chiefly employed in English non-fusee watches. The chief part is the three wheels working in the rocking-bar *ab*, one of which gears with the winding-wheel, *d*, of the barrel when the rocking-bar, which is capable of a little motion, is in its normal place, as in the fig. A contrate wheel is fixed on the end of the winding-button *c*, and by its means, when the button is turned, the train is set in motion and the barrel wound. When the hands are required to be set, a push-piece in the case bearing on the end, *b*, of the rocking-bar is pressed by the finger, taking the rocking-bar wheels out of gear with the winding, and putting them in gear with the hand-wheels at *c*. The hands may then be turned by the winding button, and, the push-piece being let go, the train returns to its normal position. The use of the fusee being attended with some amount of complication in the keyless mechanism, it is usually dispensed with on this account, and one of the most modern arrangements in an English keyless watch is shown in fig. 17. The barrel, *a*, is here made to occupy all the height between the pillar (or lower) plate and the top limit of the movement, and all the space between the centre pinion and the balance cock, in order to get a long, thin mainspring; the advantage of which is that there is an abundance of power (much more than is required for a day's going), and only a portion of the spring is used for the ordinary winding for twenty-four hours. This practically insures an adjustment of the motive power as nearly equal to that obtained by the use of the fusee as it is possible to arrive at.

Fig. 17.

Fig. 16.

Repeating watches were first made about 1676, the invention being claimed by Daniel Quare, Edward Barlow, and Tompion. They have a striking arrangement very much on the principle of the striking-clock, and on compressing a spring they at any time strike the hours and quarters, and in some cases the minutes. They are very expensive and liable to go out of repair, and repairs are costly. They have nearly gone out of use. For stop-second arrangements to record swift passing events, see CHRONOGRAPH.

In England watches are mostly made at Preston, Liverpool, Coventry, and at Clerkenwell, London, where the division of labour principle is carried out in an extreme degree—many small factories making, for instance, only balances, others springs, others cases, others hands, &c., only that small number who put the works together seeing the complete watch. At Kew Observatory there are arrangements for testing watches, and granting certificates if satisfactory, on payment of a fee. In the United States the manufacture of watches, like that of clocks, is carried on in a much more wholesale manner; the wheels and plates being stamped by machinery, every similar part being exactly alike and interchangeable; and on account of the economy of manual labour, they can be turned out marvellously cheap. Generally the large clock-factories also manufacture watches.

Horoscope. See ASTROLOGY.

Horrocks, JEREMIAH, an astronomer of remarkable genius generally known as the first observer of the transit of Venus, an account of which phenomenon he has given in a Latin treatise entitled *Venus in Sole visa*. He was born at Toxteth, near Liverpool, apparently in 1619; he entered Emmanuel College, Cambridge, May 18, 1632; was appointed in 1639 to the curacy of Hoole, Lancashire, in which village he made his famous observation (November 24, 1639, O.S.), while a mere youth. He died suddenly on January 3, 1641, the day before an intended journey, having promised to visit his chief friend, William Crabtree. Dr Wallis, his contemporary, informs us that Horrocks at the time of his death 'had not completed his twenty third year.' Newton, in the *Principia*, bears honourable testimony to the value of Horrocks's astronomical work, especially commending his lunar theory as the most ingenious yet brought forward, adding, 'and, if I mistake not, the most accurate of all.' Horrocks is frequently mentioned by the scientific men of the 17th century; the observation of the transit being by no means regarded as his sole astronomical achievement, as he added to our knowledge of the physical cause of celestial motions, deduced the solar parallax, corrected the solar diameter, and made tidal observations. Hevelius printed the *Venus in Sole visa*, which first appeared in Germany (1662); a translation of this work, with memoir by Whatton, appeared at London in 1859. In 1678 Horrocks's fragmentary works were published under the auspices of the Royal Society, being edited by Dr Wallis, with the title *Jeremiæ Horrocci Opera Posthuma*, &c. The name of Jeremiah Horrocks, long forgotten except by astronomers, is now, 'after the lapse of more than two centuries,' engraven on marble in Westminster Abbey.

Horse (*Equus*), an ungulate or hoofed mammal of the order Perissodactyla, characterised by having an odd number of toes; the family Equidæ formed the group Solidungula of old writers, owing to the presence of only a single hoof, which marks them off quite sharply from all allied animals. The English name is found in Anglo Saxon as *hors*, and is cognate with the Icelandic *hross*, German *ross*; it is sometimes referred to Sanskrit root *hresh*, 'to neigh,' but, according to some, with more probability, to a Teutonic root *har*, 'to run,' cognate with Latin *currere*. The Latin name is no doubt from the root *ak*, conveying the idea of swiftness; Sanskrit *açva*; Gr. *hippos* or *hikkos*; Lat. *equus*.

The existing species of the genus Equus are about half a dozen in number: (1) The Horse (*E. caballus*) is characterised by the tail being furnished with long hairs quite from its base; by the long and flowing mane; by the possession of a bare callosity on the inner surface of the hind as well as of the fore legs; and by the head and ears being smaller and the limbs longer than in the other species. (2) The Ass (*E. asinus*) is almost as widely distributed as the horse; it is probably of African origin, being almost certainly conspecific with the Abyssinian form, *E. tæniopus*. (3) The Asiatic Ass (*E. hemionus*) differs from the common ass in being of a more reddish colour, in the absence of the shoulder stripe, and in having smaller ears. By some zoologists it is split up into three species—the Syrian Wild Ass (*E. hemippus*), the Onager (*E. onager*), and the Kiang or Dziggetai, to which the term *E. hemionus* then becomes restricted. (4) The Quagga (*E. quagga*) has dark stripes upon the head and shoulders on a brown ground; it is said to be now extinct. (5) Burchell's Zebra (*E. Burchelli*) is white, with stripes on the body and the upper parts of the limbs; it extends from the Orange River to Abyssinia. (6) The Mountain Zebra (*E. zebra*) is white, with long black stripes reaching down to the feet. It is limited to the Cape Colony, and is rapidly disappearing. These last three are sometimes united into a special genus, Hippotigris. (7) The explorations of the Russian traveller Pzhevalski (Prejevalsky) in 1881 added another species to the list of Asiatic forms, which has been called after him. The long hairs of the tail begin only half-way down it; the mane is short and erect, and there is no forelock; the head is large and heavy; the ears smaller than those of the ass. It inhabits the dry sultry regions of the Dzungarian Desert, living in companies of fifteen to twenty, each led by a stallion. Only two herds were observed, and only one specimen was secured. The resemblance which this species presents to the horse of early sculptures has been pointed out by several observers.

Horse, with names of parts:
1, crest; 2, withers; 3, croup; 4, haunch; 5, hock; 6, cannon; 7, fetlock; 8, pastern; 9 head; 10, coronet; 11, arm; 12, gullet; 13, muzzle.

The anatomical structure of the horse has been the subject of many elaborate treatises, and only a very brief outline of its more salient features can be offered here. The skull is remarkable for its great length, especially as regards the bones of the face, which occupy an extent twice as great as those of the cranium. The orbit is approximately circular and complete behind, a fact which distinguishes the horse from the tapir and rhinoceros, as well as from its fossil allies. The co-operation of the zygomatic process in the formation of the lower part of the orbit is an unusual if not a unique feature. The great cheeks are formed mainly of the maxillary bones, though the lachrymal and malar bones occupy a considerable area in the upper portion. The nostrils are roomy, provided with extensive turbinal bones, and roofed in by the nasal bones, which are broad behind, pointed in front. In the naked skull the anterior openings of the nostrils extend far back at either side between the nasal and premaxillary bones. The palate, like the floor of the cranium, is long and narrow, forming a kind of valley between the two rows of elevated molar teeth. Below the brain-case there is a distinct canal through the alisphenoid bone for the internal maxillary artery. In the region of the ear the tympanic and periotic bones are fused together, but are loose from the skull, being held in position only by the descending process of the squamosal bone. The hyoid bone is well developed, especially as regards its anterior arch, and the basal segment sends a process forward into the tongue. The rhinoceros and tapir have a similar, but smaller, process. The mandible is very large, and the lower and hinder part is expanded into a broad flat plate for the attachment of the masseter muscle. The vertebral column is made up of seven cervical, eighteen

dorsal, six lumbar, five sacral, and fifteen or more caudal vertebræ. Most of the vertebræ are more or less hollowed behind, this character being more marked in the fore than in the hinder part of the spine. The dorsal processes of the vertebræ in the forepart of the chest are very high, and to them is attached the great elastic ligament (*ligamentum nuchæ*) which relieves the muscles of the heavy weight of the head and neck. The sternum consists of six segments, the anterior one being shaped something like the prow of a boat. There are no collar-bones, these being in fact absent from all hoofed mammals (Ungulata). The shoulder-blade is long and narrow, and bears a prominent rounded tubercle, representing the coracoid bone. The humerus is short and stout: of the two bones of the forearm the ulna is well developed behind, where it forms the great process (olecranon), projecting backwards from the elbow-joint, but it tapers gradually away below, and is firmly fused with the radius. The wrist ('knee' of common speech) consists of six bones, disposed in two rows of three each; in the second row the middle bone (*os magnum*) is very large, and supports the cannon-bone, whilst the two laterals are small, and each supports a splint-bone. The fore-foot of the horse consists of only one fully-developed digit, corresponding to the middle finger of the human hand. The metacarpal bone of this finger is known as the 'cannon-bone,' and approximated to its upper end are the thin tapering rudiments of the second and fourth metacarpals, commonly known as 'splint-bones;' the cannon-bone is succeeded by three phalanges, known respectively as the 'large pastern,' 'small pastern,' and 'coffin-bone.' Behind the foot are three small bones (sesamoids), two behind the joint between the cannon-bone and large pastern (commonly called the 'fetlock'), and a single one placed transversely behind the joint between the small pastern and the coffin-bone, commonly called the 'navicular.' In the hinder limb the thigh-bone has a prominent flattened process on its outer side, about one-third down; this is known as the 'third trochanter,' and is characteristic of all odd-toed ungulates. What is really the knee is known as the 'stifle joint.' The fibula is rudimentary. The tarsus consists of seven bones. The os calcis has a well-marked flattened heel-process, commonly known as the 'hock.' The bones of the hind-foot resemble very closely those of the fore-foot, and have the same names. A very strong ligament passes down the hinder surface of the foot, and the two smaller sesamoid bones above mentioned are imbedded in it. It is commonly known as the 'suspensory ligament of the fetlock;' occasionally muscular fibres are found in its substance, and this fact, taken in conjunction with its position and attachments, shows that it is the representative of the interosseous muscles of the human hand. The navicular bone lies in the tendon of the deep flexor muscle of the foot.

The hoof is the representative of the claws or nails of other animals. The last segment of the toe is widened out to form a foundation for it, and this is increased by cartilaginous side-pieces and a fibrous and fatty sole-piece. The integument is, of course, continuous with the skin of the limb, but it is extremely vascular, and its surface is developed into papillæ or laminæ, which secrete the horny matter of the hoof. The chief share in this process is taken by the 'coronary cushion,' or thickened ring round the upper part of the foot, and by the cushion in the sole. The result of this is that the hard external tissue of the hoof is renewed from within as fast as it wears away on the outside. The lower surface which comes into contact with the ground is hollow, and its centre is occupied by the 'frog,' a triangular eminence with its apex directed forwards, and consisting of pavement epithelial cells arranged concentrically. Other horny structures are the so-called 'chestnuts,' hard oval warts situated on the inner surface of all four legs in the horse (*E. caballus*), and of both fore-legs in the other members of the genus.

The teeth of the horse when the series is complete are forty-four in number: three incisors, one canine, four premolars, and three molars on either side of each jaw. The incisors form a semicircle: they have a pit in the apex partially filled up with bony matter, and this it is which produces the well-known appearance of concentric rings as the tooth wears away, and their disappearance when the wearing has carried the surface of the tooth beyond the bottom of the pit. The canines are either rudimentary or absent in the females. Between them and the grinding-teeth is a wide gap (diastema) in which the bit is placed. The first premolars are either quite rudimentary or absent; when present they are usually lost before maturity, so that the grinding-teeth in actual use only amount to six in number. They have very long crowns, which are gradually pushed up as the surface wears away; this peculiarity in structure is only seen in the teeth of the more recent horses, and is probably to be associated with the removal of the animal from swamps to drier plains, and hence from soft moist vegetation to food more difficult of mastication. The enamel of the teeth forms a curved folded plate, the pattern being derivable from that seen in other Perissodactyles; and it is this which produces the characteristic pattern seen in the surface of the horse's molars. The temporary or milk teeth are twenty-four in number—three incisors and three milk-molars on either side of each jaw. At birth the first and second molars are present; at one week old the central incisors appear; at six weeks the two next incisors; at three months these incisors are level, and a third molar has come into view; at six months obliteration is apparent in the central incisors; at eight months the lateral incisors have erupted, making the full number of six in each jaw; at one year the fourth molar is visible; at eighteen months the mark is very faint in the central incisors; at two years old there are five molars; at three years the permanent central incisors replace the temporary ones; at three and a half and four and a half years respectively, the same happens with the second and the lateral incisors, and at the latter date the canines appear in the male; at five years the mark is nearly, and at six years quite effaced in the central incisors; at seven years the like has happened to the next incisors; and at eight years the mark has disappeared from all the teeth, and the canines have become blunted. Hence by the presence of the different teeth and their condition as regards wear, it is possible to tell the age of a horse with considerable accuracy up to six or eight years of age, but after that no reliable conclusions can be drawn from these organs.

The lips are flexible; the palate long and narrow, and transversely ridged; the soft palate has no uvula, and, except during the actual process of swallowing, embraces the epiglottis, so that respiration is carried on entirely through the nostrils. Three pairs of salivary glands are present, the parotid being by far the largest. The stomach is simple and a good deal curved upon itself: at the œsophageal opening is a kind of muscular valve to which is commonly attributed the difficulty which a horse experiences in vomiting. The small intestine is eighty or more feet in length, and terminates in a large cæcum with sacculated walls. The liver is

almost symmetrical, and there is no gall-bladder. The heart is rather longer; the aorta gives off almost immediately a large trunk—the so-called 'anterior aorta'—which subsequently divides into the two axillary and two carotid arteries. The anterior apertures of the nostrils are large, and can be dilated by special muscles; immediately within the opening on the upper and outer side is a blind pouch ('false nostril') 2 or 3 inches in depth and of unknown function; in the ass it is even larger. There are also air-sacs in the hinder and upper part of the pharynx which spring from the Eustachian tubes. The time of pairing falls between the end of March and beginning of June. The period of gestation is eleven months, and only one foal is born at once. The mare is capable of breeding at three years old, but the stallion is not usually allowed to pair until four years of age. The average age of a horse may be put down at twenty years; the greatest age on record is believed to be sixty-two.

The senses of the horse are acute, though many animals excel it in this respect; but its faculties of observation and memory are both very highly developed. A place once visited or a road once traversed seems never to be forgotten, and many are the cases in which men have owed life and safety to these faculties in their beasts of burden. Even when untrained it is very intelligent: horses left out in winter will scrape away the snow to get at the vegetation beneath it, which cattle are never observed to do. Perhaps this may be inherited from their ancestors in the Siberian plains; but curiously enough the very same habit is observed in the horses of the Falkland Islands, whose ancestors in La Plata could have had no occasion to show the same instinct for many generations back.

With patience and kind treatment the horse can be trained to go through quite complicated feats of memory and perception. That it possesses also an accurate sense of time is clear from the facility with which it can be taught to walk, trot, and dance to music, or take part in concerted evolutions. Its knowledge of tunes is evinced by its comprehension of military signals. It is very timid and cautious and suspicious of every new sight or sound; while in respect of moral qualities it is scarcely too much to say that horses are as diverse as men.

The history of the horse can be traced back, though with extensive gaps, to the beginning of the Tertiary geological period, where we find the remains of a small ungulate no larger than a fox, to which the appropriate name *Eohippus* has been given. It was of very generalised structure, having for example four complete toes and a rudimentary fifth on the fore-feet. In Miocene times it was succeeded by *Miohippus* and *Anchitherium*, which in their turn gave place to the Pliocene *Hipparion* and *Pliohippus*, each of these showing an increase in size and a closer approach in structure to the modern horses. The history of the feet in particular furnishes one of the best examples of the gradual evolution of a specialised from a more generalised organ (see FOOT). The skull and neck became coincidently more elongated, and the teeth underwent changes which have been already alluded to.

The etymological synopsis above given shows that the horse was known to the Aryan people before their dispersal. Incised figures of the horse upon bones have been found in cave-deposits referred to the Palæolithic age, and there is evidence to show that at this period the animal was an object of the chase and a source of food. It was probably small and heavy, with a large head and an upright or hog-mane; and attention has been already called to the resemblance which some of the sculptured figures of antiquity bear to the *Equus przewalskii* above described.

The horse reappears in Neolithic remains in the Swiss lake-dwellings and elsewhere, but here apparently still as an object of the chase. The precise date of its domestication is uncertain. On Egyptian monuments no trace of it appears before the expulsion of the Hyksos or shepherd kings; and it is generally stated that the animal was previously unknown to the Egyptians, though it can hardly be considered as proved that it was introduced by the Hyksos.

In Scripture the horse is only referred to in connection with warfare; witness the poetic description of the war-horse in the Book of Job. The earliest mention of the animal in Holy Writ occurs in connection with the famine in Egypt, when Joseph gave the people corn in exchange for their horses; and its use for riding is alluded to in 2 Kings, xviii. 23.

In Homeric times the horse was not used for riding; indeed, at the battle of Marathon (490 B.C.) the Persians, but not the Greeks, used cavalry. After 450 B.C., however, the art was practised in Greece, and a treatise upon it, of somewhat later date, from the pen of Xenophon, still exists. The war-horses of the Britons and the chariots, their wheels armed with scythes, are described by Cæsar. Athelstan paid special attention to the breed of English horses, and even imported animals from Spain for its improvement. In this he was followed by other monarchs, as John and Edward III. In the reign of this latter king a law was passed forbidding the exportation of horses, and a number of Spanish jennets were introduced. Henry VIII. made various enactments for improving the condition of the English horse, particularly relating to the pasturing of entire horses upon commons and open lands, where a good deal of promiscuous and detrimental breeding had taken place. In the reign of Elizabeth it was penal to make over a horse 'to the use of any Scottishman,' a prohibition naturally repealed by her successor, who further signalised himself by bringing over to England the 'Markham Arabian,' believed to have been the first of that breed introduced. He did not prove a success; but still the experiment was repeated from time to time, and in William III.'s reign the 'Byerly Turk,' the first of a celebrated trio, was brought over to England. At the very beginning of the 18th century came the 'Darley Arabian' (the sire of Flying Childers, 1715), and later the 'Godolphin Arabian,' or Barb (1724–53). The first of these was the great-great-grandfather of the celebrated racer 'Eclipse' (foaled 1764), from whom so many winners of important races have descended. Indeed, it is not too much to say that from one or other of these horses, in most cases from all three, all horses at present on the turf trace their descent in the male line. Since the commencement of the 19th century an accurate record has been kept of the descent of all racehorses, and an attempt has been made to carry the history about a century further back.

There has been much discussion and speculation as to the kind of animal from which the domestic horse has been derived. Colonel Hamilton Smith supposed that the modern breeds have descended from about five primitive differently-coloured stocks, but this view finds no supporters nowadays; rather is it maintained that 'the similarity in the most distinct breeds in their general range of colour, in their dappling, and in the occasional appearance, especially in duns, of leg stripes and of double and triple shoulder-stripes, taken together, indicate the probability of the descent of all the existing races from a single, dun-coloured, more or

less striped primitive stock, to which our horses still occasionally revert.'

Whether the actual species thus alluded to is still living in the wild state is extremely uncertain; indeed it is held by many competent judges that no primitively wild horses now exist, the herds of horses that roam over the Russian steppes being supposed to be the descendants of animals which were once domesticated, and have relapsed into the feral state, as is known to be the case with the mustangs of South America.

The Tarpan, or wild horse of southern Russia, is a small animal, with thin, but strong, long-jointed legs, longish thin neck, and comparatively thick head, pointed ears directed forwards, and small vicious eyes. The coat in summer is close, short, and wavy, especially behind; in winter it is thick and long, forming a kind of beard under the chin; the mane thick and bushy, the tail of moderate length; the colour generally pale brown or yellowish in summer, almost white in winter. It is found in southern Russia, but (according to Radde) is absent from Central Asia, even from the north of the Gobi, where the dziggetai is found. It lives in large herds, often numbering several hundreds, subdivided into little groups or families, each presided over by a stallion, who protects his retinue valiantly, but permits no irregularities in their behaviour; young horses keep at a distance on the outskirts of the herd until they are able to undertake the cares of a family for themselves. The stallions are ever on the alert with nose and ear to detect the approach of danger, of which they give notice by a loud neigh, upon hearing which the whole herd takes to flight, sometimes disappearing as if by magic from the crafty manner in which they take advantage of irregularities in the ground. The story that they protect themselves by forming a ring with heads directed inwards has no foundation in fact, although the stallions will defend the mares and foals from impending attack. The stallions fight vigorously among themselves with teeth and hoofs, and each as he attains maturity must win his position in the herd by a series of duels. They present all the appearance of truly wild animals, and are regarded as such by the Tartars and Cossacks, who destroy them on all possible opportunities, because they are useless for taming purposes, and because they inflict considerable damage upon these horse-rearing communities by devouring their stores of hay and enticing away their mares.

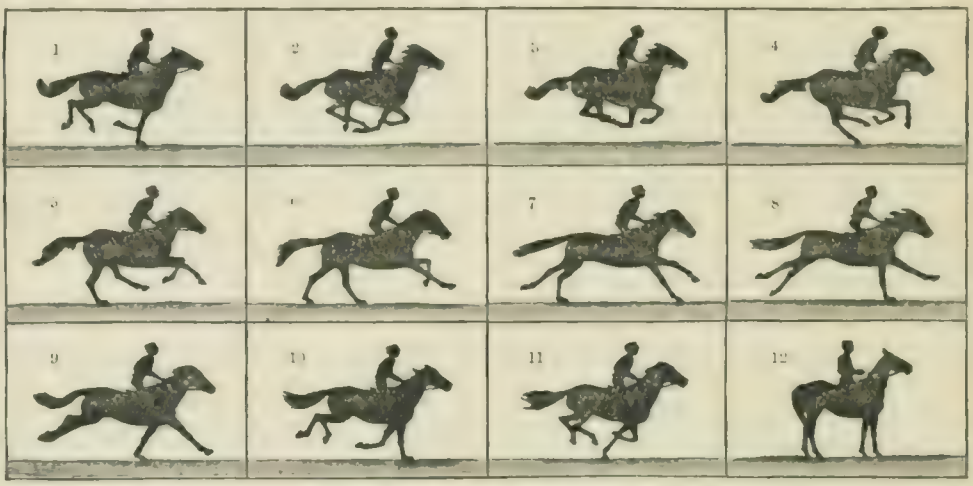
The South American wild horses, known as 'cimmarones' or 'mustangs,' are reported by Azara to be the descendants of some half-dozen individuals which were left to their own resources when the town of Buenos Ayres was abandoned about 1535. When in 1580 the town was reinstated, they were found to have increased to a very considerable number. They are of the same size as the domestic horses, but with thicker heads and legs, and longer necks and ears; all are brownish or blackish in colour. Their social system is the same as that of the tarpans. They proceed in Indian file, leaving no gaps in the series, and are avoided by travellers owing to their attempts to entice tame horses into their company, not unfrequently with success. The Indians on the pampas eat the mares and foals, and also capture a certain number in order to tame them; but the Europeans make no use of them, except perhaps to kill one when fuel is scarce in order to replenish the camp-fire with its marrow. The accounts given by travellers of these animals differ in many important particulars.

The subject of the horse's paces is one which has given rise to much controversy. It has been maintained that horses in a wild state use only the walk and gallop, the trot and others being the results of education. This question can hardly be regarded as settled even now, for the fact that quite young foals have been observed to trot beside their dams is explicable as an instance of heredity.

Six well-marked paces may be distinguished in the movements of domesticated horses—the walk, the amble, the rack or pace, the trot, the canter, and the gallop. The study of the precise movements of the different limbs in carrying out these paces is very difficult, especially in the case of those in which the motion is rapid. Marey, the French physiologist, was the first to attempt a rigorous analysis of these movements by means of apparatus. He attached to the horses' hoofs small elastic bags, connected by tubes with pointers, which made marks upon a revolving cylinder. When any one of the feet touched the ground the bag was compressed, and the pointer instantly made a corresponding mark upon the cylinder. Very valuable results were obtained by this method of study; but they need not be further detailed here, as they have been superseded by the beautiful photographic investigations of Muybridge. In these experiments the horse was made to proceed along a track in front of a row of twelve or twenty-four cameras, so arranged that, as the animal passed in succession before each of them, an instantaneous photograph of it was obtained. These pictures furnish the means of analysing the various paces, as the exact attitude of the horse is shown at very short intervals of time. In the case of an ordinary walk the horse has always two and sometimes three feet on the ground at once. The order of the succession of the footfalls is as follows: left hind, left fore, right hind, right fore; furthermore the horse is alternately supported by the two feet of the same side (laterals) and by a hind and a fore foot of different sides (diagonals); when the animal rests upon the laterals, the suspended feet appear in a side view between the supporting feet; when upon the diagonals, the suspended feet hang out one in front of and the other behind the supporting feet. These rules furnish the means of testing the accuracy of artistic representations of walking horses. The amble is a rapid walk, the length of time the feet rest upon the ground being reduced so that the body is often supported upon only one foot, and generally only on two. In the 'rack,' the fore-feet move as in a slow gallop, the hind-feet as in a trot. In the (American) 'pace,' the legs of the same side are lifted together—an action which has aptly been compared to two men running one behind the other and keeping step. The trot has been defined as a pace characterised by the synchronous movement of the diagonal limbs, though in practice the movement is rarely, if ever, quite simultaneous. It has often been maintained by experienced horsemen that a horse in trotting has always at least one foot in contact with the ground. So far, however, is this from being the case that a fast trotter is quite unsupported for more than half the distance he traverses in each stride. In the canter the order of the footfalls is the same as in the case of the walk, and the characteristic difference is due to the peculiar rhythm as well as to the final effort which propels the body at the conclusion of the stride as the fore-leg leaves the ground.

We may analyse the gallop by the aid of the accompanying reduced silhouettes copied from Muybridge, and then it will be seen that its conventional representation by artists is quite unlike any of the actual positions assumed by the moving animal. Fig. 1, it must be remembered, does not represent the start of the gallop, but merely a phase in a continuous action; the body is moving forward by impetus already acquired, and the fore-foot just leaving the ground

is adding to it. Fig. 2 is twenty-seven inches further forward; the leg which was on the ground in the last becomes so distant that it was obliged to quit the ground, and is now thrown backward; the hind-legs are gathering up and coming forwards preparatory to descending. Fig. 3 shows no further propulsion, but the hind-legs are still moving forwards. In fig. 4 one hind-leg has just touched the ground, the other is at its greatest extension; one fore-leg has come forward about half-way. In fig. 5 both fore-legs are being extended in advance; one hind-leg is pushing upon the ground, the other being brought down. Fig. 6 shows both hind-legs at work propelling the body forwards and upwards; one leg has nearly done its work, the other just begun; one fore-leg is at its maximum forward range, the other is being projected. In fig. 7 one hind-leg has left and the other is just leaving the ground; one fore-leg has reached the ground and is just beginning its stroke. Fig. 8 shows both hind-legs in the air, and the weight of the body supported upon one fore-leg. In fig. 9 one fore-leg is doing its stroke, the other is nearly ready to begin; the hind-legs remain much as in the last diagram. In fig. 10 one fore-leg has left the ground, the other is at work upon it; and the hind-legs are being brought forwards. This brings us to the end of the series,



The Horse in motion (after Muybridge).

for fig. 11 is really intermediate between figs. 1 and 2. One or two facts may be seen from these diagrams, which, though small, are accurate. The greatest propulsive force resides in the hind-legs; as the weight of the horse descends upon any one of its feet, the strain upon the limbs is so great that the pastern joint lies quite horizontally; the legs are bent when taken up and straightened in the descent; the heels strike the ground before the toes. The length of a stride in the different paces may be approximately stated as follows: walk, 6 feet; amble, 10 feet; rack, 12 feet; trot, 8 to 18 feet; canter, 10 feet; gallop, 12 to 20 feet. In the matter of speed a horse may be said to walk 4 or 5 miles an hour, trot under saddle 6 to 12 miles, or in harness 10 to 12 or even 14; as regards a gallop, the fastest records seem to be 3 miles in 5 min. 42½ sec.; 1 mile in 1 min. 43 sec. It is stated that some of the old Cleveland horses could carry 760 lb. for 60 miles in twenty-four hours, and Lawrence gives a story of a Galloway which beat the coach from London to Exeter, 172 miles, by a quarter of an hour, notwithstanding its frequent relays of fresh horses.

A few words must be devoted to the various domestic breeds of horses.

The *racer* is the one for which England is pre-eminently famous, and his origin from the combination of oriental with native blood has been above alluded to. The age of the racehorse whenever foaled is reckoned from the next 1st January, and hence it is advantageous that they should be born early in the year, so as to gain as much time as possible for development. In July or August of the following year the serious training for the two-year and three-year-old races now in vogue begins. Very few horses now race after four years old, but are used for stud purposes, at prices varying with the success they have attained on the turf.

Successful racehorses vary much in shape, some being small and neat, others tall and bony. In height they may be said to range from 15 to 16½ hands (the hand = 4 inches), though the most usual dimensions are between 15½ and 16 hands; the head should be light and well set on the neck, the ears small and pricked, the eye large, and the nostrils wide and expansible. The neck must be moderately long, and must combine muscular development with lightness; the windpipe broad and loose; the withers may be high and narrow; but it is imperative that the shoulder be sloping and muscular. The body should be moderately deep and straight; length should be given to it by the shoulders and hips; the loins must be broad and firm; the hips long and wide. The limbs ought to be well proportioned and cleanly modelled; the fetlock-joints large and the pasterns strong; the feet of moderate size, with no sign of contraction either in the heels or the frogs. The tail should be set on high. Most important of all is it that the different parts should harmonise together, and that the action should be good. Colour is perhaps of less consequence; still it is worthy of remark that for a long time the majority of winners have been chestnuts.

At his fastest speed a racehorse may cover a mile in 1 min. 43 sec.: the rate of a mile a minute currently attributed to Eclipse is, according to a competent authority, 'wildly incredible.'

In America the favourite form of horserace is the trotting-match, which appears to have originated in the prohibition of horseracing by the Puritans. The gradual evolution of the fast trotter is remark-

able. In 1828 a bet of $2000 was made and lost that no horse could trot one mile in 3 minutes. In 1852 the time required for that distance was 2 min. 26 sec.; in 1866, 2 min. 18 sec.; whilst in 1881 it had been brought as low as 2 min. 10·5 sec. In 1843 there was one horse that could do the mile in 2½ min., whilst, in 1871, 233 horses, and in 1882 no less than 1684 could accomplish this feat. See TROTTING.

The *hunter* is sometimes, but not often a thoroughbred. If this be the case, he is generally a horse that has failed to stand the test of the short rapid races, and is thereafter trained for a hunter. He differs from the racer mainly in carrying-power and endurance. A deep girth, with broad hips, a back not over long, and strong legs are his most essential characters. Jumping is a most necessary accomplishment. A five-barred gate is the ordinary limit of a leap; but a few horses have been known to clear heights between 6 and 7 feet. Yet only a few will jump 10 or 12 feet of water in the hunting-field, although horses have been known to leap a distance of 36 feet.

The *charger* ought to be 15·3 hands high. He should be a good weight-carrier, and the paces should be easy, owing to the regulation length of the military stirrups. Furthermore, as the soldier has to devote his right hand to the management of his weapon, only the left can be used for guiding his steed, which has thus to be accustomed to take its instructions from the pressure of the leg or indications given by the heel.

Harness-horses are of all degrees of value, and of varieties of race and breed, from the tall high-stepping bays, 16½ or even 17 hands in height, which draw the four-in-hands of the wealthy, to the little pony which drags a basket phaeton. A really well-matched pair of carriage-horses of good action will fetch a very high price. For horses drawing light vehicles, 15·1 hands is an average height; those preferred for coaching are taller, and the wheelers are commonly an inch higher than the leaders.

Cart-horses, like other harness-horses, are of all kinds. The enormously heavy animals which have been developed as the result of crossing the native blood with Flemish are now to be seen almost exclusively in the drays of brewers; for the most part they are bred in Lincolnshire, and are expensive to rear, and hence to purchase. The old Cleveland breed and the Suffolk Punch are said to be now extinct, and the Clydesdale is perhaps the favourite breed for this purpose at the present time.

A pony is defined as being a horse under 13 hands high; the Exmoor ponies are a valuable breed, with well-shaped head, good quarters, and powerful hocks. For small dimensions the palm is, however, carried off by the Shetland breed, the height of which is often as little as 10 hands, and not unfrequently less even than this.

In the manner of stable management it is of first-class importance that the stable itself should be in a healthy locality, and free from even the suspicion of bad smell or foul air, to both of which horses are particularly sensitive. The stalls should be roomy, and the slope of the floor no more than is needful to allow the drainage to run off; indeed an arched floor is to be preferred to a smooth slope. The stalls should be adequately lighted, but the eyes should not be strained by the use of too light paint or whitewash on the walls. Good ventilation is imperative, and should be achieved without exposing the animal to cold draughts. About 55° F. is the mean temperature to be aimed at, but it is very often impossible to keep it down nearly so low as this; in winter it is easy to keep it up, or even if this fail, the difference can be made up by clothing. In all matters pertaining to the treatment of a horse, regularity and moderation are the great secrets of success.

The food varies much with the nature of the work the horse is called upon to perform, and the means of his owner. A cavalry charger is allowed 10 lb. oats and 12 lb. hay per diem; an omnibus horse 17 lb. of mixed oats and maize, the proportions varying according to the relative prices of the two grains, and 10 lb. hay. A hunter is very commonly allowed 12 lb. oats, 2 lb. beans, and 6–8 lb. hay.

A certain moderate amount of exercise every day is necessary; nothing is worse than excessive fatigue one day and entire rest another. Two hours walking will as a rule suffice, but the needs and capabilities of different animals must be studied by those who have the care of them; in all cases it should be enough to prevent undue fidgetiness when the animal is used by his master.

HORSE-BREAKING, a process through which all young horses have to go before they are fit for work. The racehorse is generally broken when about eighteen months old, but carriage and draught horses are not broken until four-year-olds, though many farmers break their horses for light work at an earlier age. The process differs considerably in various countries, but that in use in England, though the slowest, is the most thorough, and the only one fitted to break a really valuable horse without risk. The chief requisites for a good horse-breaker are gentleness and unlimited patience, as a hasty action may undo days of work. Before the commencement of the training, the horse is accustomed to be touched by a man, and to the feel of a halter. After he is familiar with his breaker, who should on no account be changed, he is taken out with leading rein and halter until used to being led. The breaker may then commence to 'mouth' his charge—i.e. teach him to answer the pressure of the bit. This is generally done by placing a bit in the horse's mouth every day while in the stable, until he is used to the metal; he is then driven with long reins attached to his bit, by the breaker, who walks behind and turns his pupil in various directions until he answers the rein readily. After the mouthing has been thoroughly done, the horse may be mounted or harnessed and gradually accustomed to his proper work. As the majority of horses do not repay so much trouble, they have to be broken more quickly, but in the case of a high-bred animal at the risk of his courage or his temper.

In 1858–60 great attention was called to the system of an American called J. S. Rarey, who broke horses thoroughly in an hour. The essence of Rarey's method (a method published many years previously, but first introduced to the public by Rarey) was the 'casting' or throwing down of the horse, and frightening him so thoroughly that he gave no further resistance. Twenty years later much discussion was raised over an Australian system, said to differ entirely from Rarey's, but which only differed in the fact that the horse's head was tied to his tail until he fell, instead of violently casting him. Both of these systems, while of great utility in the case of a vicious horse, or where horses are plentiful and of little value, are much too severe to be undergone by a high-couraged but nervous colt, who only requires patience and gentleness to master him.

From 1784 a tax was imposed upon horses and horsedealers; in 1869 this was fixed at 10s. 6d. on each horse or mule, and £12, 10s. was charged for a dealer's license; the tax was removed in 1874.

In the year 1888 no less than 11,505 horses were imported into the United Kingdom from various parts of the world, chiefly from Germany (6667) and Denmark (2234), the average value of the

animals being £18, while 12,880 home-bred horses were exported at an average of £65. In 1891-95 from 14,000 to 23,000 were annually imported, and from 12,000 to 17,000 exported.

[Classic works on the horse by Stonehenge (new ed. 1887), Walsh ['Stonehenge'] (new ed. 1880), Youatt (new ed. 1882), Cuvier and Alex. (Paris, 1856; Haves, 1893), Sidney (new ed. 1893), Tegetmeier (1894), and Iwan (1894); on horse management, by Mayhew (1864) and others; on the anatomy of the horse, by M'Fadyean (1884) and Flower (1892); on horse-breaking, by Moreton (1888) and Hayes (1889). See also the arts. on Riding, Hippotherapy, Veterinary Medicine, Glanders, Broken Wind, Unsoundness, &c., and Hath's *Illustrated Record of Horse-racing* 1887.]

Horse, Master of the, the third great officer of the court, who has the superintendence of the royal stables, and of all horses and breeds of horses belonging to the Queen. He exercises authority over all the equerries and pages, grooms, coachmen, saddlers, and farriers, and has the appointment and control of all artificers working for the royal stables. He is answerable for the disbursement of all revenues appropriated to defray the expenses of his department; but his accounts are audited and examined by the Board of Green Cloth. He has the privilege of making use of the royal horses, pages, and servants, and rides next to the monarch on all state occasions. The office is one of great antiquity, and is considered a position of great honour. He is appointed during pleasure, by letters-patent; but his tenure of office depends on the existence of the political party in power. The salary is £2500 a year.

Horse-chestnut. See Chestnut.

Horse-fly. See Forest-fly.

Horseguards. See Guards. The name is also applied to a large public office in Whitehall, appropriated to the departments under the general commanding-in-chief. The word Horseguards is used conventionally to signify the military authorities at the head of army affairs, in contradistinction to the civil chief, the Secretary of State for War.

Horse-hair. See Hair.

Horse-hair Worm. See Hair-eel.

Horseless Carriages. See Traction-engines, Gas-engine.

Horsens, a Danish seaport on the Horsensfiord, 32 miles SSW. of Aarhuus. Pop. 12,654.

Horse-power. The word *power* is of frequent use as a scientific expression. Thus we speak of steam-power, water-power, and so on. When used in this sense it is quite obvious that reference is merely made to the nature of the store of energy in the particular motor under consideration. Again, when we speak of the total energy of a given system as the total power that it has of doing work, it would seem to be almost an insult to the mental power of our auditor to tell him in addition that by the latter phrase we mean simply total work measured in terms of any convenient unit. But it is often necessary to know the quantity of work which can be produced in a given time by a given motor. It is in this connection that the term one *horse-power* is used to denote the rate at which on the average a horse can do work per unit time, and this rate is adopted in Britain as the unit rate of working. Estimates of its numerical value necessarily differ very much; and so, in order to get a definite unit available for scientific purposes, the convention is made that the original estimate of Boulton and Watt shall be regarded as correct. The value which they gave was 33,000 foot-pounds per minute.

An ordinary rule for calculating the horse-power of a steam-engine is to divide by 33,000 the continued product of the area of the piston in inches, the pressure in pounds weight per square inch, the length of the stroke in feet, and the number of strokes per minute. Thus, by the horse-power of an engine we merely mean the numerical rate at which it can do work, expressed in terms of the above conventional unit, and this number obviously coincides with the number of horses to which the engine is equivalent as regards work in the same time. Of course the available horse-power is less than the actual horse-power as got by the above rule, because of the work which has to be done against friction in the engine itself. See Steam-engine. The term *man-power* is similarly used, being usually taken as one-eighth of a horse.

Horseracing. Horses were used for harness purposes before they were ever ridden; and chariot-races took place before horses raced under saddle. The earliest mention of chariot-races occurs in Homer (*Iliad*, xxiii.), who gives a clear description of those contests. The programme of the Grecian games included horseracing in the 33d Olympiad—i.e. the year 648 B.C.; some authorities give the time as the 23d Olympiad, though this earlier date was that of chariot-racing. Racing can thus claim a history, albeit a broken one, of nearly 3000 years, and, at the period above mentioned, it was so far reduced to a system that the horses had to be entered and sent to Elis at least thirty days before the contests began, the riders spending the month in a course of training and exercise. The 71st Olympiad, or 496 B.C., the Greeks instituted a race called the 'Calpe,' which was confined to mares, just as the One Thousand Guineas and the Oaks are now; while according to Grote's *History of Greece* it would appear that, in course of time, a certain number of races were restricted to colts of one age, so that they might not labour under the disadvantage of competing under equal weights against older horses. In the 10th century, Hugo Capet accompanied his request for the hand of King Athelstan's sister by a present of several German running horses. In the reign of Henry II. 'hackneys and charging steeds' raced at Smithfield; and under Richard I. we hear of a course three miles long, with a prize of 'forty pounds of redy golde' for the winner. To James I. the credit is commonly assigned of having placed the turf on a permanent basis. His taste for racing appears to have been fostered by an accidental circumstance. It is said that several Spanish horses, thrown overboard from the ships of the Armada, reached the coast of Galloway, and proved superior in speed to any of the native horses. The suitableness of Newmarket as a site for racing had been perceived prior to the advent of James I., who, however, lost no time in witnessing the races there, as he was present in 1605, probably for the first time, that being two years after his accession to the throne. It is worth mentioning that the king was at Lincoln races in 1607, because, on the occasion of a race taking place there on the 3d April, the king appears to have acted as a sort of clerk of the course, for he caused the track, a quarter of a mile long, to be 'raled and corded with rope and hoopes' on both sides, whereby the people were kept out, and 'the horses that ronned were seen faire' (Nichols' *Progress of James I.*). Cromwell was, to a certain extent, an upholder of racing, though perhaps he did more for breeding than for racing; but Charles II. greatly encouraged the turf, and caused races to be held near whatever place he might happen to be staying. Queen Anne, as is well known, kept racehorses, ran them in her own name, and gave plates to be run for. None of the first three Georges signalised themselves by extreme love for the turf; but it was in the twenty-third year of George III. that the Horse Tax, which *inter alia* imposed a duty of two guineas

upon every horse entered or starting for any plate, &c., was passed. Before George III.'s long reign came to an end the Prince of Wales was a prominent figure in the racing world, his career as a horse-owner dating from 1784. In 1786 the stud was sold in consequence of the pecuniary embarrassments of the prince; but, on parliament generously increasing his income, he took to racing once more. When the prince next gave up racing it was for a very different reason. His horse Escape was entered to run on the 20th and 21st at the Newmarket October meeting in 1791. On the first day it was beaten by three others; but on the second day it won easily, whereupon unpleasant remarks were made, the Jockey Club took the matter up, and Sir Charles Bunbury told the prince that if he continued to allow Chifney to ride his horses no gentleman would start against him. Rather than sacrifice his jockey he retired from the turf, though he made a modified reappearance in 1805 at the request of the Jockey Club; but the royal stable was never represented at Newmarket after 1808. William IV. naturally had no taste for racing, but as a sort of duty he kept on so that the nominations should not become void.

Since the accession of Queen Victoria the turf has not received any particular encouragement from royalty; in fact, from a purely racing view a retrograde step has been taken, as in 1886 the Queen's Plates were discontinued, and the sum they represented was increased to £5000, which has been handed over yearly to the Royal Commission on Horse-breeding, who have expended this amount in promoting the breeding of hunters and other half-bred horses. Since the time of William IV. no member of the royal house owned racehorses until the Prince of Wales bought a few.

Of all the meetings held at the present time the one at Chester is possibly the most ancient, as an order bearing date 10th January 1571 provides for the Saddlers' ball, which was of silk, being changed into a silver bell of the value of 3s. 4d., and this bell was to be the prize for the horse 'which, with speed of runninge, then should runne before all others.' In 1610 the one silver bell was changed into three 'cupps,' and the race was then known as 'St George's Race.' In 1623 'one faire silver cupp,' worth about £8, was substituted for the three cups. The Chester Cup, as at present constituted, was first run for in 1824. In Yorkshire, a horseracing county *par excellence*, races took place, according to Camden's *Britannia*, as early as 1590 in the forest of Galtres, on the east of York, the prize being a small bell with which the head of the winning horse was decorated; while Drake, in his *Eboracum*, states that, when the river Ouse was frozen over in 1607, a horserace was run upon it from the tower at Marygate end, through the great arch of Ouse Bridge, to the Crane at Skeldergate Postern. On the Knavesmire racing dates from 1709, though the first race for the King's Guineas did not take place till 1731. The St Leger has done more than anything else to make Doncaster Town Moor famous; yet, though races do not appear to have been held there so early as at Chester or Newmarket, so long ago as 1703 the Yorkshiremen pitted their horses one against another, and twelve years later the corporation of Doncaster contributed towards the stakes. In 1776 a sweepstakes was won by the Marquis of Rockingham's Allabulculia, and in 1777 by Mr Sotheron's Bourbon. In 1778 the race, the conditions for which were identical with those governing the aforesaid sweepstakes, first received the name of the St Leger, the proposal to so designate it emanating from the Marquis of Rockingham, who presided at the dinner held at the Red Lion on the entry day. A Colonel St Leger, who lived near Doncaster, originated the sweepstakes in 1776, and the race received its name in his honour. Since its first institution the conditions of the race and the weights carried by the horses have several times undergone alteration. Ascot (q.v.) has been a seat of horseracing since 1711.

Epsom (q.v.), perhaps the most popular race-course in England, first became famous in 1630 for its mineral waters. It is uncertain when racing was first practised, but it certainly existed in 1648, and in 1660 Pepys regrets his inability to be present at Banstead Downs to see a great horse and foot race. When racing at Epsom was in its infancy the usual custom was to decide a race in the forenoon, after which the whole company went into the town to dinner, and if another race was fixed for the same day, it took place after dinner. In 1780 the Derby Stakes were first instituted, and named after one of the turf's best and most influential supporters—the twelfth Earl of Derby. In point of antiquity, however, the Oaks can claim precedence over the Derby, the 'Ladies' Race' having first taken place in 1779. On thirteen occasions since the Derby was first run the winner of that race has succeeded in also winning the St Leger. Champion achieved the dual victory in 1800; and then ensued a period of forty-eight years before the feat was again accomplished by Surplice in 1848; and then, strange to say, the same horse won both races in two successive years, Flying Dutchman and Voltigeur winning in 1849 and 1850 respectively. The other double winners have been West Australian in 1853; Blair Athol, 1864; Gladiateur, 1865; Lord Lyon, 1866; Silvio, 1877; Iroquois, 1881; Melton, 1885; Ormonde, 1886; and Donovan, 1889. The St Leger has been won by the Oaks winner on six occasions—viz. Formosa, 1868; Hannah, 1871; Marie Stuart, 1873; Apology, 1874; Janette, 1878; and Seabreeze, 1888. The Two Thousand Guineas, Derby, and St Leger have been won by the same horse six times only. The first-named race was first run in 1809, but it was not till 1853 that Mr Bowes's West Australian succeeded in carrying off all three events; the other wearers of what has been termed the 'triple crown' being Gladiateur in 1865, Lord Lyon in 1866, Ormonde in 1886, Common in 1891, and Isinglass in 1893; but in 1868 Formosa, winner of the Oaks, had been previously successful in the Two Thousand, and subsequently won the St Leger. The Derby (won by Lord Rosebery in 1894 and 1895 with Ladas and Sir Visto, and by the Prince of Wales in 1896 with Persimmon) is still regarded as the great race of the year, but has hardly kept up its character. In 1867, when Hermit won, there were thirty starters, but that number has never been reached since; and it is only in the years 1869, 1872, 1874, 1878, and 1879 that the starters have numbered between twenty and thirty. In 1886 and 1888 there were nine competitors only, and a proportionate falling off is noticeable in the cases of the other 'classic' races, as they are termed. This is doubtless owing to the competition of the rich stakes offered by the executive of the gate-money meetings. In 1880 the sum of £2000, at that time the largest amount ever given to any one race, was added to the Manchester Cup. Since that time stakes have been increasing in value. The Sandown Park Eclipse Stakes, founded in 1886, was in 1889 worth £11,160; the Royal Stakes at Kempton Park, first run in 1889, was worth £9500; the Portland Stakes at Leicester, for two-year-olds, amounted to £5250; and the Prince of Wales's Stakes, for three-year-olds, at the same meeting, to £11,000. Whether these valuable prizes are for the ultimate good of the turf remains to be seen; but it is indisputable that they have materially interfered with the old-established races; so in

order to keep pace with the times it has been arranged that the Derby shall never be worth less than £5000; the race of 1890 being the first to come under the new order.

During the flat racing season of 1889 the value of the stakes competed for reached the unprecedented sum of £180,889, 18s., of which no less than £73,858, 10s. was won by the Duke of Portland, a sum very far in excess of the winnings of any other owner. Donovan alone won £38,666, 15s.; Ayrshire, £20,660; and Semolina, £9285, 8s. Mr H. Milner was credited with £21,545, 6s., and Chevalier Ginistrelli with £11,867, 11s. For yearlings of fashionable pedigree large prices are always forthcoming; in 1876, 4100 guineas were paid for Maximilian, and in 1889 Colonel North gave 4000 guineas for Garonne. But till then unheard of prices were reached when at Doncaster in 1891 Common was bought by Mr Blundell Maple, M.P., for £15,000, and an offer of £20,000 was subsequently refused. And Ormonde, sold in 1890 to a gentleman in Buenos Ayres for £15,000, was bought by Mr MacDonough of San Francisco for £30,000.

Flat-racing is altogether under the direction of the Jockey Club, and, by rule 65, any horse running at a meeting not under Jockey Club rules is thenceforward disqualified for ever from running at meetings at which the rules are in force. The Jockey Club appears to have come into existence during the reign of George II.; and the first mention of it occurs in Heber's *Racing Calendar* for 1758, in connection with a regulation passed in the March of that year directing all riders to pass the scales when they came in, under pain of dismissal. In the volume on *Racing* in the 'Badminton' series, the writer on the 'History of the Jockey Club' says that tradition assigns to the year 1750 the origin of the Jockey Club. At anyrate a room on the site of the present Jockey Club buildings was erected in 1752 on ground leased by William Erratt, a horse-dealer, to the Duke of Ancaster and the Marquis of Hastings, in trust for fifty years. The rules of racing are promulgated by this body, and are altered from time to time as circumstances may suggest. In 1889 the rules were entirely recast, and came into force with the commencement of the season of 1890. The new code confers increased responsibilities and power upon the officials, and makes several changes in the rules which had previously been in force. The 'apprentice allowance' has been done away with, and the restriction which formerly precluded foreign horses from being handicapped in England unless they had been six months in the country has been abolished. The object of the rule, which to some persons was very obnoxious, was to enable the handicapper to have some knowledge of the previous performances of the horses to which he had to assign weight. The Jockey Club is a self-constituted body, and many of its acts are neither recognised nor governed by the law of England; yet with respect to racing it discharges many important functions. No duty, however, has been more disagreeable than the one it was called upon to perform in 1889, when the stewards, Mr James Lowther, Lord March, and Prince Soltykoff, sat as arbitrators in the case of Sir George Chetwynd *v.* Lord Durham, which was an action originally brought in a court of law, but afterwards referred, with the assent of both parties, to the Jockey Club. The proceedings arose out of a speech made by Lord Durham at the Gimcrack dinner at York in 1887, in which sundry charges were made against certain persons on the turf.

According to *Bell's Guide*, 2100 horses ran in the year 1889. Of this number 988 were two-year-olds; 523 were three-year-olds; four-year-olds numbered 277; and there were 312 horses of the age of five years and upwards. In the same publication the names of 108 trainers appear; and there are 33 officials who have received licenses to act in various capacities at race-meetings. During the season of 1890, 105 meetings were fixed to take place between the 24th March and the 22d November; and the names of 195 jockeys appear in the table of winning mounts for the year 1889. The earnings of a jockey in good practice are very great. The regulation fee is £5 for a winning mount and £3 for a losing one; but it is comparatively seldom that a jockey's remuneration is confined to the minimum scale. Bets are often made for him; retaining fees run to £1000 or more; presents are almost invariably given for successful riding; and in some cases the stakes of great races have been promised to jockeys if they win. It is not in England alone that horseracing flourishes. Many meetings are held in France, the chief races run there being the Derby, first run in 1836; the Oaks, in 1843; and the Grand Prix. Important meetings are held in Germany and at Vienna; while racing is becoming popular in Italy. Some of the great English races have been won by French horses. Thus, the Goodwood Cup was won in 1853, 1855, 1857, and 1873 by Jouvence, Baroncino, Monarque, and Flageolet respectively. Mortemer won the Ascot Gold Cup in 1871, and Henry in the succeeding year; while Boiard in 1874 and Verneuil in 1878 must be added to the list. In 1876 Chamant and Jongleur between them carried off the Middle Park Plate, Dewhurst Plate, and Criterion Stakes; Camellia won the One Thousand in 1876, and Chamant the Two Thousand in 1877; Enguerrande and Camellia ran a dead-heat for the Oaks in 1876, and the St Leger fell to Rayon d'Or in 1879; and, in addition to these victories of French horses, Fille de l'Air carried off the Oaks in 1864, and Gladiateur, as already mentioned, won the Two Thousand, Derby, and St Leger in 1865. The long list of successes gained by the French horses in 1876, coupled with the fact that so few French races were open to English horses, caused the late Lord Falmouth to give notice to the Jockey Club in that year that he would bring forward a motion to the effect that no foreign horses should be allowed to compete in England until the bar to the admission of English abroad was removed. The idea, however, did not find favour, and the motion was allowed to drop. The successes of American horses date back to 1857, in which year Prioress won the Cesarewitch for Mr Ten Broeck, that gentleman's Starke being the winner of the Goodwood Stakes in 1859 and of the Goodwood Cup in 1861; Iroquois was the Derby winner of 1881, and of the Prince of Wales's Stakes (Ascot) and of the St Leger as well; while Foxhall took the Cesarewitch and Cambridgeshire in 1881, and the Ascot Cup in 1882. In more recent years Wallenstein and Passaic achieved some successes. Hungary has been represented on English racecourses by Kisber, the Derby winner of 1876, and by Kincsem, who won the Goodwood Cup in 1878. The entries for the Derby of 1890 included two Australian colts sent over by the Hon. James White. Although trotting is the national sport in America, the galloping thoroughbred is somewhat growing in favour. Russia has its races; the turf exists as an institution in the colonies, at the Cape, and in India; and racing, for a few years prior to 1889, advanced so quickly into popular favour at Buenos Ayres that the export trade to that place was a very brisk one, and an English racing man or two and a trainer were tempted to go over to the Argentine Republic. The native trainers, however, were successful over the Englishmen.

The rules of racing in England provide that in

each day's racing there shall be two races of 1 mile or upwards, not being selling races; and no race shall be run over a less distance than 5 furlongs. In the opinion of those who have the interests of the turf at heart, there are too many of what are colloquially known as '5-furlong scrambles,' which make shifty horses and bad jockeys. The rule as to the number of races in a day of 1 mile or upwards is of course strictly complied with; but it is at comparatively few meetings that a 2-mile race is witnessed. At Ascot there are several events run over 2 miles; the Gold Cup course is 2½ miles; and that for the Alexandra Plate 3 miles; while the Goodwood Cup distance is also 2½ miles, and the Cesarewitch is run over 2¼ miles.

The weights carried by racehorses are assigned in various ways. In some races, like the Derby, Oaks, and St Leger, which are confined to horses of one age, all carry the same weight; but if, as in the Derby, both fillies and colts are eligible to compete, the fillies have a sex allowance of 3 lb. Next come the weight-for-age races, open to horses of different ages, in which case horses of the same age carry the same weight, the younger ones less than older ones. Thirdly comes the handicap, which, owing to the field it opens to fraud, is said to have been responsible for many of the malpractices which occasionally take place in connection with the turf: it was brought into fashion by the promoters of race-meetings sometimes finding it difficult to provide sufficient sport for the spectators and the owners of horses. When racing was in its infancy all horses, which were, however, usually five or six years of age, carried the same weights, so that if a four-year-old happened to start he met maturer horses on disadvantageous terms; and, when a horse had made a name for himself, no others were entered against him. Weight-for-age races (in which horses of six years old and upwards give weight, according to a scale laid down, to younger competitors) and give-and-take plates were gradually introduced, the give-and-take plate being one in which a certain weight, say 9 stone, was assigned to horses of a certain size, 14 hands, for example. Horses above that size carried 7 lb. extra for each inch, while those who fell short of that measurement were allowed 7 lb. for each inch below 14 hands. Handicaps were known in the 18th century, but it was not till about 1818 that they figured often in the programmes of race-meetings. Since then they have increased in number.

The handicaps at the meetings of which the Jockey Club stewards are also the stewards of the meeting are made by the official handicapper, who is a salaried official of the Jockey Club; but his services are retained for many other meetings, for which he obtains extra remuneration from those employing him. In racing it is sought to equalise the chances of the different horses by apportioning to each the weight which, in the opinion of the handicapper, will bring them together, his aim being to bring about a dead-heat by all the horses competing. The conditions of a handicap are duly published, and the date at which the entries close is notified. The handicapper then proceeds to consider the powers of the horses, and assigns to each horse the weight he thinks it ought to carry, and in due course the several owners know the handicapper's estimation of their horses by the publication of the weights in the *Racing Calendar*. Those who think that the handicapper has entertained an exaggerated estimate of their horse's powers can save further cost in the way of forfeit by declining to accept; and then the next piece of intelligence published in the *Sheet Calendar* is the 'acceptances,' as they are called—in other words, the names of the horses whose owners are *primâ facie* satisfied with their chances, though it by no means follows that all those that are 'left in,' as the phrase runs, will start for the race. It frequently happens that the horse to which is allotted the top weight is among the non-acceptors, not always because his owner thinks that the horse cannot give away the required weight, but because he is occasionally unwilling for him to carry so much for fear of breaking him down, of which there is obviously more chance under 9 stone than under 6 or 7 stone.

Moreover, the conditions of nearly every handicap provide that a horse winning a race after the publication of the weights shall carry a penalty, which must be added to the weight originally allotted by the handicapper; and the incurring of this penalty is often the reason of horses not starting. When the top weight or weights do not accept, the highest weight accepting is raised to that which was originally the maximum of the handicap, and then, assuming the maximum to have been 9 stone, a notice appears in the *Calendar* to the effect that, the highest weight accepting being 8 stone 4 lb. (or whatever the impost may have been), it has been raised to 9 stone, and the others in proportion. The minimum weight to be carried in a handicap or any other race is fixed by the rules of racing at 6 stone, and by the 27th rule the top weight to be allotted in a handicap shall not be less than 8 stone 12 lb. For a year or two prior to 1889 a rule was in force that apprentices who had not ridden three winners might claim a 5-lb. allowance so long as the weight to be carried did not fall short of the minimum weight permitted. The object of the rule was to encourage the employment of lads not yet out of their time who gave promise of riding well; but after the regulation had been in force for a short time it was urged that the 5-lb. allowance upset the work of the handicapper; so, when the rules of racing were revised by the Jockey Club in 1889, the section authorising the apprentice allowance was excised.

To decide upon the weights horses shall carry is no easy task. The handicapper must be a regular attendant at race-meetings and able to form his own judgment on what he sees; for the position a horse may occupy at the termination of a race is not necessarily any criterion of his true form. He may be out of condition; or, when his jockey finds he cannot win with him, a horse is almost invariably eased and finishes seventh or eighth when he might have been third or fourth; and the handicapper must also possess sufficient perception to see when an attempt is made to throw dust in his eyes. Even so astute a man as the late Admiral Rous occasionally made mistakes; and whoever may for the time being occupy that difficult position must abandon all hope of pleasing everybody.

Horse-radish (*Cochlearia Armoracia*), a perennial herbaceous plant, belonging to the natural

order Cruciferæ and to the same genus as scurvy grass. It possesses the same antiscorbutic properties as the latter, but is better known popularly on account of its use as a condiment with roast-beef. It is highly stimulant, exciting the stomach and promoting the secretions, particularly that of urine. Its virtues depend upon a volatile oil similar to oil of mustard. The oil contains about 30 per cent. of sulphur to its other elements, and is recognised as one of the most powerful antiscorbutics known. Horse-radish is a native of south-eastern Europe, has long been cultivated in British gardens, and is naturalised in some parts of England and Ireland. For its perfect cultivation it requires very deeply-worked soil, from which it is very difficult to eradicate, as the smallest bit of root not removed will emit a bud. Cases of fatal poisoning have several times occurred through the ignorant mistaking the roots of Monkshood (q.v.) for those of horse-radish. The former are powerfully poisonous; but there is no resemblance between the two plants in any respect. The roots of horse-radish are long, tapering, cylindrical, with a cream-coloured skin. Those of monkshood are short, irregular in shape, blunt at both ends, and have a nut-brown skin. The root-leaves of horse-radish are from 9 to 18 inches long by from 4 to 6 inches broad, entire, but often toothed on the margins. Those of monkshood are roundish in outline, divided to the base into five to seven deeply-cut, linear, finely-pointed segments. The flowers of horse-radish, which are sparingly produced in Britain or the United States, are borne on branching stems about 2 feet high, and composed of four pure white spreading petals. Monkshood bears its flowers freely in handsome racemes, at the extremities of usually simple or unbranched stems; the colour is deep blue, and the unopened flower strongly resembles a helmet or hood.

Roots of Horse-radish (*a*) and Monkshood (*b*).

Horse-radish Tree. See Ben (Oil of).

Horseshoeing. In olden times horses generally went unshod, as they now do in many eastern countries; but our macadamised roads and paved streets, fast paces and heavy loads, would speedily wear away the stoutest hoofs, and a rim of iron has accordingly been long in use as a protection. In style and pattern the horse's shoe varies almost as much as his master's boot, and like it, when badly made or unskilfully fitted, produces serious inconvenience, and even leads to accidents and diseases. When the feet are strong and properly managed nothing is better than a plain shoe of tolerably uniform breadth and thickness, carefully fashioned to the shape of the foot. But many good authorities prefer what is called a seated shoe, which has a level part for the crust to rest upon, and within that the inner half of the shoe towards the sole surface is bevelled off. This seated shoe is thus wider than the plain shoe, and hence affords greater protection for a weak or flat sole. For faulty or diseased feet special forms of shoes are made. In all healthy feet the shoe should be fitted to the foot, and not, as is commonly done, the foot cut to fit the shoe. Another frequent error must be avoided—keeping the shoe short and spare at the heels. For roadsters the toe of the fore-shoes should be slightly turned up, which greatly obviates tripping. The hind-shoes are generally thickened and sometimes turned down at the heels. The number of nails required must vary somewhat with the weight of the shoe and the soundness of the horn; five is the minimum, nine the maximum. It is important, however, that the shoes be firmly held on by as few nails as possible. In a saddle-horse with sound feet three on the outside and two on the inside should suffice to hold a well-fitted shoe. Horses for heavy draught

A sound Fore-foot prepared for the Shoe:
A, A, the heels of the crust; B, the toe cut out to receive the clip; C, C, the quarters of the crust; D, D, the bars as they should be left, with the full frog between them; E, E, the angles between the heels and bars, where corns appear; F, F, the concave surface of the foot; G, G, the tuberous heels; H, the cleft.

are generally shod in Scotland with tips and heels, which afford increased firmness of tread and greater power, especially when dragging heavy loads. To preserve the foot in a sound state the shoes should be removed every month. When the shoe is carefully taken off, the wall-surface on which it has rested should be rasped, to remove any ragged edges and any portions of adhering nails. Having for a month been protected from the wear to which the exposed portions of the foot are subjected, it will probably have grown considerably, and in a stout hoof will require to be cut down with the drawing-knife, especially towards the toe. Except in very strong feet and in farm-horses working on soft land, the surface of the sole uncovered by the shoe seldom requires to be cut. It is the natural protection of the internal delicate parts, and must be preferable to the leather and pads often artificially substituted for it. The bars must likewise remain untouched, for they are of great service in supporting weight; whilst the tough, elastic frog must be scrupulously preserved from the destructive attacks of the knife, and allowed uninjured to fulfil its functions as an insensible pad, obviating concussion, and supporting weight. When the shoe is put on and the nails well driven home, they should be broken off about an eighth or even a sixteenth of an inch from the crust, and

hammered well down into it. This obviously gives the shoe a much firmer hold than the usual practice of twisting off the projecting nail close to the crust, and afterwards rasping down any asperities that still remain. When the shoe is firmly clinched the rasp may be very lightly run round the lower margin of the crust just where it meets the shoe, to smooth down any irregularities; but all further use of the rasp must be interdicted. The clinched nails if touched will only have their firm hold weakened; nor must the upper portions of the crust, which blacksmiths are so fond of turning out rasped and whitened, be thus senselessly deprived of those external unctuous secretions which render the unrasped foot so tough and sound and so free from sandcracks. The hoof cannot be too dry and tough. From time to time various attempts have been made to fix shoes to horses' feet without nails; and a shoe has been invented, which is said to have answered the purpose; but in the opinion of many the system is still immature, and requires to be more extensively tested. An interesting exhibition of horseshoes, ancient and modern, was held in London in March 1890.

See *Notes on the Shoeing of Horses*, by Lieut.-col. Fitzwygram; a paper on 'Horseshoeing,' by Miles, in the *Journal of the Royal Agri. Soc.* (reprinted by Murray); and Williams' *Veterinary Surgery*.

Horsetails (*Equisetum*), a genus of herbaceous plants which in itself constitutes the singular natural order Equisetaceæ. The family is distinguished from all others by the leafless, articulated, and whorled stems and branches, which in structure and character closely resemble some of the larger fossil plants now extinct. They are separated from all other plants also by their fructification, which is an ovoid or oblong terminal cone-like spike, consisting of several whorls of peltate, shield-shaped, short-stalked brown or black scales, under each of which are six or seven capsules filled with minute spores, and opening on the inner side. Under the microscope there will be seen attached to the base of each spore four thread-like filaments, somewhat club-shaped at the apex, rolled spirally round the spore when moist, but uncoiling elastically when dry.

The species of horsetail are few in number, although widely diffused in the temperate and colder regions of the northern hemisphere, becoming rare in the tropics. Nine species occur in Britain, usually in moist or marshy places, but they adapt themselves easily to a great variety of stations, and are almost ineradicable where they obtain a footing in either field or garden. Diuretic and other medicinal properties have been ascribed to them, but apparently on slight grounds. They all contain a large quantity of silica in the cuticle of their stems, which has rendered them useful in polishing metals, marbles, ivory, cabinet-work, &c. *E. hyemale* is the most favoured species for these purposes, and it is imported in considerable quantity from Holland under the name *Dutch Rushes*.

Horsham, a market-town of Sussex, near the source of the Arun, 26 miles NNW. of Brighton and 35 SSW. of London. The noble parish church, Early English in style, was restored in 1865; other buildings are the corn exchange (1766), grammar school (1540; rebuilt 1840–57), &c. Brewing, tanning, iron-founding, and coach-building are carried on. Horsham returned two members of parliament from the 14th century till 1832, and one down till 1885. East of the town is St Leonard's Forest, and 2 miles NW. Field Place, Shelley's birthplace. Pop. (1871) 6874; (1891) 8637. See Histories of Horsham by Howard Dudley (1836) and an anonymous writer (1868).

Horsley, Samuel, an English prelate, was the son of a clergyman, and was born at London in 1733. He was educated at Westminster School and Trinity Hall, Cambridge; and in 1759 succeeded his father as rector of Newington, in Surrey—a living which he held for thirty-four years, though he also enjoyed in the interval many other preferments, including the archdeaconry of St Albans (1781). In 1767 Horsley was elected a Fellow of the Royal Society; in 1774 he published his *Remarks on the Observations made in the late Voyage towards the North Pole, for determining the Acceleration of the Pendulum*; and two years afterwards he issued proposals for a complete edition of the works of Sir Isaac Newton, which, however, did not make its appearance till 1785. But the grand event in his career was the controversy with Priestley, in which he displayed remarkable learning and acuteness, somewhat marred by intolerance and contemptuous bitterness. The work that excited the controversy was Dr Priestley's *History of the Corruptions of Christianity*, among which corruptions was included the orthodox doctrine of Christ's uncreated divinity. Horsley reviewed the work with great severity in his charge delivered to the clergy of his archdeaconry, May 22, 1783. Priestley replied the same year; and in 1784 Horsley retorted in seventeen *Letters*. These were, in return, met by a new series from Priestley. After a silence of eighteen months Horsley again replied, and in 1789 collected and published the whole that he had written on the subject. His services were rewarded with the bishopric of St Davids in 1788, with that of Rochester in 1793, and with that of St Asaph in 1802. He died at Brighton, October 4, 1806. Other works besides sermons, were on Hosea, the Psalms, biblical criticism, and classical subjects.

Horsley, Victor Alexander Haden, F.R.S., born at Kensington, 14th April 1857, is a son of John Callcott Horsley, R.A. (born 1817), and as a physiologist is distinguished for his work in the localisation of brain functions and in the treatment of Myxœdema. He studied at University College, London, has contributed largely to medical journals, was Croonian lecturer to the Royal Society, and Fullerian professor (1890–93) at the Royal Institution, and is professor of Pathology in University College. He is a member of many societies at home and abroad, and was secretary to the Royal Commission on Hydrophobia. He is a strenuous defender of necessary experiments on living animals.

Hort, Fenton John Anthony, D.D. (1828–92), born in Dublin, graduated at Cambridge as third classic, and was a fellow of Trinity (1852–57), and from 1878 Hulsean professor of Divinity. With Bishop Westcott he constructed a revised Greek text of the New Testament. See his Life and Letters (2 vols. 1896).

Hortense. See Bonaparte, Vol. II. p. 288.

Hortensius, Quintus (114–50 B.C.), Roman orator, largely devoted himself to the defence of aristocratic offenders, such as Verres. His countless speeches are known to us only by the merest fragments.

Horticulture. See Gardening.

Hortus Siccus. See Herbarium.

Horus. See Egypt, Vol. IV. p. 234.

Horvath, Michael (1809–78), Hungarian historian, was professor of Hungarian in Vienna, Bishop of Csanad, and, in the revolutionary war, minister of public instruction. He returned from exile in 1867, and is remembered for his *History of Hungary to 1823* (1842–46), and its continuations, *Twenty-five Years of Hungarian History*,

ns,' 2s (2 vols. 1863), and *History of the War of Independence in Hungary* (3 vols. 1865).

Hosanna, used as an expression of praise, is really a prayer—'Save, we pray' (through Gr. *hōsanná*, from Heb. *hoshaánnā*).

Hosea (Heb. *Hōshēa*, LXX. *Osee*; Vulg. *Osee*), the first in order of the twelve minor prophets, is nowhere mentioned in the Old Testament except in the book which bears his name. From this source we learn that he was a citizen of the kingdom of Israel (see i. 2, where 'the land' is plainly the northern kingdom, and vii. 5, where 'our king' is the king of Samaria), that his father's name was Beeri, and that he prophesied during, and apparently also after, the reign of Jeroboam II.—i.e. from about the middle of the 8th century B.C. The fourteen chapters which preserve to us all that we know of what must have been a long period of prophetic activity may plausibly be believed to have been edited by himself and given to the world in writing towards the close of his life. The first three derive a special interest from their autobiographical element. The remaining eleven consist of a series of prophecies, mostly of a threatening character, relating to the kingdom of Israel. The details of these present many exegetical difficulties, and it is impossible to determine with any certainty what may have been the precise circumstances under which each oracle was originally delivered. Some relate to the still outwardly prosperous times of Jeroboam II., and others, most likely, to the troubled years that immediately followed. They point generally to an exceedingly dissolute internal condition of society, which ultimately drove the prophet to the verge of despair, and out of which he saw no escape save in the destruction of the kingdom, to be followed by a final restoration brought about in some unexplained way through the sovereign love and mercy of Jehovah. The question of greatest interest to interpreters of the Book of Hosea is that connected with the narrative of the first three chapters, in which the prophet relates how the experiences of his married life furnished him with his prophetic message. In the opening words we read of his marriage to Gomer bath-Diblaim, by whom he had three children to whom he gave the significant names, Jezreel ('Jehovah shall sow'), Lo Ruhamah ('not pitied'), and Lo Ammi ('not my people'). Her profligate conduct after marriage led to a separation, but, in obedience to a divine call, he took her back; and in the ultimate victory of marital love over a wife's infidelity he saw the token and the promise of the final triumph of Jehovah's grace over Israel's sin. According to the modern view, first suggested by Ewald, further elaborated by Wellhausen (in 4th ed. of Bleek's *Einleitung*) and Robertson Smith, and now adopted by most scholars, Hosea, i. 2, is to be interpreted in the light of such a passage as Jer. xxxii. 8, where we have a clear instance of recognition of a divine command only after the deed has been accomplished, and there is therefore no necessity for supposing that Hosea was aware of the profligate character of Gomer bath-Diblaim when he married her, or indeed that her profligacy had declared itself at that time. Earlier interpreters either took the passage literally and argued that a marriage which otherwise would have been contrary to all sound moral feeling was justified by a divine command, and that the repulsive elements in it magnified the obedience of the prophet; or they treated it as an allegory, without much attempt to explain how a proceeding which would be objectionable in fact ceases to be so in the realms of fiction.

[illegible] W. R. [illegible], *[illegible]* 1882. [illegible] special commentaries on the book by Simon (Hamburg and Gotha, 1851), Wünsche (Leip. 1868), Nowack (Berlin, 1880), and Cheyne (new ed. Cambridge, 1889). See also the commentaries on the minor prophets generally—Ewald (*Propheten*, vol. i.; Eng. trans. 1876), Hitzig, Keil (Eng. trans. 1868), Reuss (*Hist.* 1876), Pusey (1860); and, for homiletical purposes, Schmoller in Lange's *Bibelwerk* (Eng. trans. 1874).

Hoshangabad, chief town of Hoshangabad district (area, 4437 sq. m.; pop. in 1891, 529,945), in the Central Provinces of India, stands on the Nerbudda River, 40 miles SSE. from Bhopal. It does a lively business in English piece-goods, cotton, grain, &c. It has been in British hands since 1817, and is a military station. Pop. 16,490.

Hoshiarpur, capital of a district in Punjab, near the foot of the Siwalik Hills, 90 miles E. from Lahore. It is the seat of an American Presbyterian Mission. Pop. 21,552.

Hosiery, in its most limited sense, refers to the manufacture of stockings (hose); but in its more general application it comprises all knitted goods, whether made by hand or by machinery. The use of hose or stockings originated in the cold countries of the north, and probably the first were made of skins, and subsequently of cloth. Illuminations in ancient MSS. show that these nether garments were worn by the Anglo-Saxons and the Normans. The art of knitting was invented (it is supposed in Scotland) in the 15th century. Certain it is that knitted stockings found their way to France from Scotland, and led to the establishment of a guild of stocking-knitters, who chose for their patron saint St Fiacre of Scotland (really an Irish monk of the 6th century, the patron of gardeners). In 1589 William Lee, of Woodborough, Nottinghamshire, entirely altered the hosiery trade by inventing the knitting-frame, or stocking-frame; and, although he did not live to enjoy much benefit himself from it, it soon became a very important feeder to the commerce of Great Britain.

The first improvement of marked importance on Lee's machine was the ribbing apparatus invented by Jedediah Strutt in 1758. This consisted in adding a second series of needles, with an arrangement for working them, to Lee's machine, which could only make a plain, not a ribbed, web. Sir Marc I. Brunel invented, in 1816, a circular knitting-frame, to which he gave the name of *Lyrotuer*. This produced a tubular web, and was a meritorious machine, but it did not come much into use till it was improved, about 1844, by Claussen of Brussels. His further modification of it in 1847 caused it to be widely adopted, and it has received various improvements since. Several important improvements in hosiery machines are due to Townsend, chief among them being a tumbler or latch needle, patented by him in 1858, which is now largely employed in certain kinds of knitting-machines, especially those for fancy hosiery and for domestic use. Fig. 1 shows two views of this

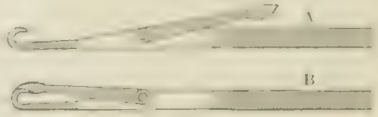

Fig. 1.

needle. A represents it with the hinged latch or tongue folded back on the stalk so that the hook may catch the thread. B shows the latch closed on the point of the hook so that it may freely pass a new loop of thread through the last-formed loop. The latch is moved by the loops of thread or yarn during the action of the machine. The modern

form of Lee's needle is shown in the other figures. The most prominent name among the improvers of hosiery machines in comparatively recent times is that of William Cotton of Loughborough. Between 1851 and 1869 he devised arrangements both for narrowing and widening the fabric, and in conjunction with Attenborough made a number of alterations for the better on the general arrangements of the parts of the knitting frame. Some of the best hosiery machines driven by steam-power now in use are on Cotton's system.

The names of two Americans appear in the list of those who have contributed to the advancement of knitting machinery. In 1858 an English patent was taken out by W. C. Gist for a circular machine, which, by using several feeders instead of one, enabled striped work with as many as sixteen colours to be made at once. Another English patent was taken out in 1877 by Almet Reid for a circular knitting-frame for making automatically articles of many different shapes, in which the loops or stitches are so locked together as not to unravel when cut or torn.

A knitted fabric of one colour consists of one continuous thread instead of a warp and a weft thread as in weaving, and the knitting done by a machine is exactly of the same nature as that done by hand. With the aid of the accompanying illustrations a brief description will suffice to explain the principle on which a knitting-machine or stocking frame works. A perspective sketch of a

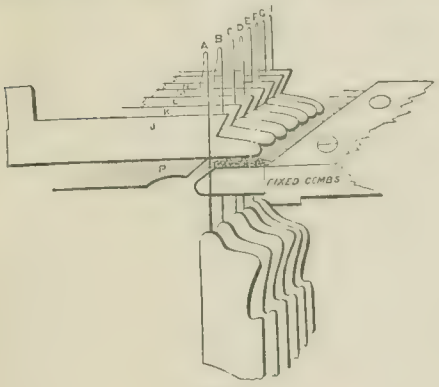

Fig. 2.

part of a division of the machine is given in fig. 2. The hooked needles (Lee's) are shown at A, B, C, D, E. The 'sinkers,' J, K, L, M, N, are thin plates of steel, which have a backward and forward motion, each sinker passing between two needles. When the sinkers are moved to the left of their position in the figure a space occurs between them and the needles, along which the thread or yarn is laid. As the thread proceeds along the face of the needles the sinkers one by one advance and thrust the thread between them, thus forming a row of loops, after which the sinkers retire.

All the needles act simultaneously and in the same way; but to make the action of the machine more easily understood, figs. 3, 4, and 5 show the movements of a single needle. Fig. 3 represents, in side elevation, the position of a sinker, a comb, and a needle, at the moment when the needle has sunk between the sinkers, till the newly-formed loop of thread, O, enters the hooked portion or open eye. The needle, continuing its descent, is rocked forward till, as shown in fig. 4, the 'beard' of the hook comes against the 'presser bar' P, which presses for a moment the point of the beard into a groove on the stem, and so forms a closed eye round the loop O. The needle, in further descending, pulls this loop through the last-formed loop

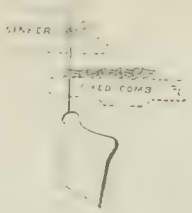

Fig. 3.

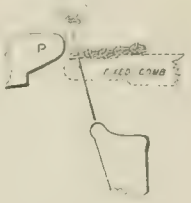

Fig. 4.

of the knitted fabric. It is in this closing of the hook to enable the one loop to be drawn through the other that the great ingenuity of Lee's invention lies. Fig. 5 shows the new loop just pulled through, and then the needle, rocking forward in the direction of the arrow, ascends, while the loop slips down its stem. The next loop is pulled through in the same way. The explanation just given of the motion of one needle applies to all the needles, as they are fixed in line on a rigid bar.

Fig. 5.

Fig. 6 shows an enlarged plan of five rows of loops, in which the triangular dots, Nos. 1, 2, 3, 4, 5, 6, 7, and 8, in the last-formed row are the needles with the thread-carrier, T, in the position where it commences to lay the thread in front of them. The knitted fabric is wound upon a roller as fast as it is formed. It would take up too much space to describe the arrangement for narrowing or widening the fabric, to bring it to the shape of a stocking for example. This is called 'fashioning.' The web, however, is often not shaped in the process of knitting, but cut, when finished, into any form required, as is done with ordinary cloth.

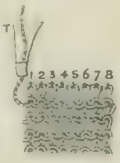

Fig. 6.

Some of the most improved modern knitting-frames work at a great speed. One with six divisions of 480 needles each (a usual size) has in all 2880 needles. Each of these forms loops at the rate of 90 in a minute, so that the whole machine forms 259,200 loops in a minute. An expert hand-knitter, working with wires, can hardly do more than 100 loops in a minute.

Numerous hosiery or knitting machines, varying much in their details, are now made both for factory work and for domestic use. In the volumes for 1886 and 1889 of the *Textile Manufacturer*, published at Manchester, several of the best of these are illustrated and described. To the pages of that journal we are indebted for the diagrams given in this article. For the history of the knitting-frame, see Felkin's *Machine-wrought Hosiery and Lace* (1867).

Nottingham and Leicester, especially the former, are the chief centres of the hosiery manufacture in the United Kingdom, but it extends into the adjoining counties. It is also extensively carried on in France, Germany, and other continental countries. In the United States hosiery factories are in active operation in New York, and in five or six neighbouring states. The materials used for hosiery are cotton, wool, and silk; and the number of different kinds of articles made, including stockings, gloves, shawls, hats, bonnets, and

all kinds of underclothing, amounts to thousands. The result of recent improvements in the machinery for the manufacture of hosiery is shown by the fact that in 1854 it cost fully six shillings to knit a dozen pairs of stockings by the hand knitting frame then in use; whereas the cost at the present time by power knitting machines does not exceed one shilling and tenpence per dozen pairs.

Hospice, the name given to the pious establishments for sheltering travellers, maintained by monastic persons, usually in connection with monasteries. One of the best known in inhospitable regions is that on the Alpine pass of Great St Bernard (see ST BERNARD), of which mention is made as early as 1125. Travellers are lodged and boarded gratuitously, but those who can, deposit a suitable present in the alms-box. Similar establishments are found on the Simplon, the Little St Bernard, and the Bernina.

Hospitallers, in the Roman Catholic Church, are charitable brotherhoods, founded for the care of the poor and of the sick in hospitals. They follow for the most part the rule of St Augustine, and add to the ordinary vows of poverty, chastity, and obedience, that of self-dedication to the particular work of their order. The Knights of St John of Jerusalem (see below) and the Teutonic Knights (q.v.) were both originally hospitallers. The Knights Hospitallers of the Holy Spirit were founded at Montpellier in 1198 by Guy of Montpellier, and the hospitallers of Our Lady of Christian Charity at Paris in the end of the 13th century by Guy de Joinville. And numerous similar orders have been established since then.

THE ORDER OF THE KNIGHTS OF ST JOHN OF JERUSALEM, otherwise called the Knights of Rhodes, and afterwards of Malta, a celebrated military and religious order of the middle ages, originated about 1048 in a hospital, dedicated to St John the Baptist, which some merchants of Amalfi built at Jerusalem for the care and cure of pilgrims to the Holy Sepulchre. After the conquest of Jerusalem by the crusaders under Godfrey of Bouillon in 1099, the hospital servants were joined by many from the Christian army, who resolved to devote themselves to the service of the poor and sick pilgrims. Gerard, the first rector of the hospital, formed them into a regularly-constituted religious body, bound by the vows of poverty, chastity, and obedience, and subject to the jurisdiction of the Patriarch of Jerusalem. Pope Pascal II. gave his sanction to their institution as an order in 1113. Raymond du Puy, the successor of Gerard, extended the activity of the order by pledging its members to protect pilgrims on the roads from the sea to the Holy City. Soon afterwards the order became predominantly military: the Hospitallers were sworn to defend the Holy Sepulchre to the last drop of their blood, and to make war upon the infidels wherever they should meet them. Having become military as well as religious, the order was recruited by persons of high rank and influence, and wealth flowed in from all quarters. Various hospices, called commanderies, were established in the maritime towns of Europe as resting-places for pilgrims, who were there provided with the means of setting out for Palestine. These branch establishments also collected the revenues of the order, and received candidates for admission to its ranks. After the conquest of Jerusalem by Saladin the Hospitallers established themselves at Acre in 1191. Soon afterwards a bitter rivalry sprang up between them and the Knights Templars, which finally set them in battle array one against the other in 1259, when victory inclined to the former. The Hospitallers clung with desperation to Acre, the last Christian stronghold in Palestine; but after a terrible siege by the ruler of Egypt, they were compelled to sail away to Cyprus (1291), where the king of the island gave them an asylum for some years.

In 1185 Frederick Barbarossa took the order under the protection of the empire. In the following century the title of 'master' was changed by Pope Clement IV. into 'grand-master.' The brethren consisted of three classes, knights, chaplains, and serving brothers, these last being fighting squires, who followed the knights in their expeditions. The order was in the 12th century divided into eight 'languages'—Provence, Auvergne, France, Italy, Aragon, England, Germany, and Castile. Each 'language' embraced several grand-priories, and under these again were a number of commanderies.

In 1310 the knights, under the grand-master Fulk de Villaret, in conjunction with a party of crusaders from Italy, captured Rhodes and seven adjacent islands from the Greek and Moslem pirates, and carried on from thence for more than two hundred years a successful war against the Turks. During this period the Hospitallers were the owners of nearly 19,000 manors in Europe, and to these 9000 more were added on the suppression of the Knights Templars in 1312. In 1523 they were compelled to surrender Rhodes to Sultan Solyman, and retired to Candia (Crete). In 1530 Charles V. assigned them the island of Malta, with Tripoli and Gozo. Tripoli was surrendered in 1551 to the corsair Dragut, who in 1565 laid siege to Malta, which the Hospitallers had strongly fortified. Dragut was beaten off at the end of four months with the loss of 25,000 men. The knights continued for some time to be a powerful bulwark against the Turks; but after the Reformation a moral degeneracy overspread the order, and it rapidly declined in political importance. In 1798, through the treachery of some French knights and the weakness of the last grand-master, Hompesch, Malta was surrended to the French. The lands still remaining to the order were about this time confiscated in almost all the European states; but, though extinct as a sovereign body, certain branches of the order, with more or less just claims to legitimate succession, have continued during the 19th century to drag on a lingering existence in Italy, France, Spain, England, and Germany. After 1801 the office of grand-master was not filled up, till in 1879 the pope appointed a grand-master for the Italian and Bohemian 'languages.' In their military capacity the Hospitallers wore red surcoats over their armour. The badge worn by all the knights was a Maltese cross, enamelled white and edged with gold. The motto of the order was 'Pro fide,' with the later addition of 'Pro utilitate hominum.'

There are two modern associations which ascribe their origin to the original order—the Brandenburg 'Johanniterorden' and the English order of the Knights of St John. The former, a direct descendant of the German 'language' of the old legitimate order, was reorganised in 1853, and did good service in the campaigns of 1866 and 1870. In England the property of the old order was confiscated in the first year of Elizabeth's reign, and the order itself was dissolved and declared to be illegal by Henry VIII. in 1541. Nevertheless the 'language' of England was resuscitated in 1827; the revived society has its headquarters at St John's Gate, Clerkenwell, London. Its efforts are purely philanthropic: it distributes charity to convalescents who have just left hospital, maintains cottage hospitals and convalescent homes in the country, and an ophthalmic hospital at Jerusalem. It has founded the street ambulance system, and was chiefly concerned in the origination of the Red Cross Society.

See Histories of the order by Bosio, Del Pozzo, Vertot

(Eng. 1728), Taaffe (1852), Porter (1883), De Salles (1889); and Delaville de Roux's *Les Archives, la Bibliothèque, et le Trésor de l'Ordre de St-Jean à Malte* (1883).

Hospitals are so called from the medieval *hospitia*, or more properly the class of hospitals established very generally for the reception and relief of lepers, whose malady was one of the scourges of Europe. These leper hospitals were very commonly in England and in Scotland called 'Spitals;' hence the frequency of such names of places as Spital, Spitalfields, &c. The leper hospitals and other kinds of the old hospitia disappeared with the improvement of society, and substitutes for them on a broader scale began to be established in the modern form of hospitals. Of public establishments under this general designation there are now, as is commonly known, three distinct classes—hospitals for the reception and treatment of the sick and hurt, hospitals for the board and education of children, and hospitals for the reception and permanent board of poor old persons of both sexes. As in the present work the more remarkable hospitals receive some notice under their respective heads, we need here only offer a few general observations.

Hospitals for the sick and hurt are in some parts of England and Scotland termed Infirmaries. Under whatever designation, institutions of this kind are now established in all parts of the civilised world. They are supported in most cases on a principle of charity, but in some special instances from the funds of the state or the civic municipalities. The primary or more important object of all such institutions is to mitigate bodily suffering, whether that arises from natural or accidental causes, in which respect they are indispensable as a refuge to all who are unable to pay for private medical or surgical aid, or as a convenient means of succour on emergencies to persons of every rank and degree of opulence. While such is the main object of these benevolent institutions, they are also serviceable as schools for medicine and surgery; as such, no university, at which these and kindred branches of learning are taught, can be said to be complete without the adjunct of a well-organised hospital, where professors can practically educate their pupils by pointing out varieties of disease and injuries, and exemplifying methods of treatment. Hence the best specimens of hospitals are found in university towns—as in London, Paris, Edinburgh, and some other cities famed as schools of medicine and surgery. The older of the London hospitals are St Thomas's (1553), St Bartholomew's (1546), and Bedlam or Bethlehem (1547), to which may be added the Westminster (1719), Guy's (1725), the Lock (1746), St George's (1733), the London (1740), the Middlesex (1745), and University College (1833). A considerable accession to the number took place in the reign of George II., when society became alive to the value of such institutions. It was at this period that the Royal Infirmary of Edinburgh was established (1730). The antiquity of British hospitals sinks into insignificance in comparison with that of some institutions of this kind on the Continent. The Hôtel Dieu in Paris, which is alleged to be the most ancient hospital in Europe, was founded in the 7th century, and, long known as the Maison Dieu, received the benefactions of successive sovereigns.

In London, Paris, and other large seats of population, besides the general hospitals, there are now lying-in hospitals, ophthalmic hospitals, consumptive hospitals, children's hospitals, &c.—each with its peculiar accommodation and staff of officials. Convalescent Hospitals (q.v.) are a valuable adjunct to ordinary hospitals for the sick. Independently of these there are hospitals for the treatment of mental maladies, of which Bethlehem and St Luke's in London, and the establishments in Paris, known as Hospices, are examples. To this class of institutions belong Lunatic Asylums (q.v.), also asylums for the reception and treatment of naturally imbecile children; these last, though in operation for some time in France and Switzerland, being but of recent establishment in Great Britain. To these must be added the isolation hospitals for the treatment of smallpox, scarlet-fever, and other forms of infectious diseases, which have been established in recent years by every energetic sanitary authority out of the rates. Besides these institutions under civil administration are those hospitals which are maintained by the English, French, and other governments for the military and naval services. In the United States, where every medical college has its own hospital, or the right to teach in the wards of public institutions, there are also many hospitals or asylums for inebriates (see INEBRIATES), for opium-users, and those addicted to the use of other narcotics (see also FOUNDLING HOSPITALS, AMBULANCE).

Until the middle of the 19th century the organisation and management of hospitals and the nursing of the sick in Britain and in most parts of Europe were, except in some few instances, extremely defective. Public opinion was then aroused on the question, and certain principles were laid down on hospital construction and hospital nursing which have been recognised and adopted to a greater or less extent since that time. These principles may be briefly summed up as follows under the three heads: (1) Construction, (2) Administration, (3) Nursing.

(1) *Construction.*—The first object is to obtain pure air in and around the building. The purity of air around will depend upon the site. The soil should be clean and dry; the position should admit of free circulation of air untainted by surrounding sources of impurity or damp. The number of sick who can be placed on a given site depends on the form of the buildings in which they are to be placed. It is now considered that more than 100 patients should never be under the same roof. And less is better. This has led to the pavilion form of building being adopted—blocks connected by corridors. *Two* floors only of patients' wards are admissible, but hospitals with only one floor for the ward accommodation are now universally recognised as best. More than three is insanitary. Hospital buildings consist (*a*) of the wards for the reception of the sick, and their appurtenances; these necessarily form the basis of the design; subsidiary to these are the operating theatre, &c.; and where there is a medical school instructional accessories have to be provided. (*b*) The buildings for administration—i.e. for lodging the staff, the kitchen, stores, and dispensary, should be always subordinate to the question of the accommodation for sick. In some hospitals extra out-patients' departments are provided. These should never be placed under the same roof with the wards for the sick.

(*a*) The first principle of the ward unit is that the ward and ward offices should be self-contained within one door commanded by the head-nurse's room, so that at any moment she may know where every patient is. The size of the wards has to be somewhat guided by economy of administration, so as to enable the largest number of patients to be nursed by a given number of nurses. The limit of the ward is practically the number who can be efficiently nursed under one head-nurse. Each ward may have subsidiary to it one or two small wards for bad cases.

The ward appurtenances consist partly of nursing

accommodation and partly of offices for patients. The nursing accommodation includes a bedroom for the head nurse; a serving room in which food can be warmed, drinks and extra diets made, and linen kept and aired, hot water obtained, poultices, &c. made; also a nurses water-closet near. The head-nurse's room should be so placed as to enable the nurse to exercise constant supervision over the ward and the patients. The offices for patients comprise a lavatory for the patients, a bath room with a movable bath, which bath-room and lavatory should be large enough for minor surgical operations, and water-closets in the proportion of about 3 to 10 per cent. of the number of patients—the general hospital for acute cases, mostly in bed, requiring the lesser number—one or more slop sinks, a place for keeping ejecta of patients for medical inspection. These appurtenances should be cut off from the ward by ventilated lobbies, and should be always warmed and ventilated independently of the ward.

The form of the ward should be such as to enable the air to be renewed with the greatest facility. Experience in this climate shows that the windows are the best appliance for complete renovation of the air. For this purpose they should be on opposite sides of the ward, and the wards should not exceed from 20 to 28 feet in width. There should not be above two rows of beds between the windows. The rectangular form enables these conditions to be best fulfilled in the case of large wards. Where the wards are not intended to contain more than from four to eight patients a circular form of ward has been in some cases found unobjectionable; but as it is a principal object in hospital construction to provide a large wall space in proportion to the floor and cubic space per bed in the wards, and as the rectangular form affords the largest, and the circular form the smallest wall space in proportion to the area of the ward, it is evident that the rectangular form is that best adapted to sanitary requirements.

(*b*) The subsidiary accommodation should be so arranged as not to interfere with the purity of air in or around the wards. The fewer places in and about the ward the better. Not only the best arrangements, but what use will be made of them, has to be considered. The sleeping accommodation for nurses should be so placed as to ensure purity of air in the dormitories, and complete quiet for the night-nurses to sleep by day.

(2) *Administration* is intended to enforce economy so far as it is consistent with the provision of requirements for the sick. It is usually in the hands of a governing body, which issues all regulations after consultation with professional advisers; it controls the expenditure and raises the funds to support the hospital. The governing body acts through its treasurer, secretary, and steward for the general discipline and control of expenditure. The well-being and cure of the patients is directed by the professional staff of medical officers, which consists of visiting physicians and surgeons and of resident medical officers, who control the treatment of the patients under their direction and in the absence of the visiting medical officers. The nursing of the sick is under a trained matron or lady superintendent, who should be the head of all the women employed in the hospital.

(3) *Nursing* the sick and injured is performed usually by women under scientific heads—physicians and surgeons. Nursing is putting us in the best possible conditions for nature to restore or to preserve health—to prevent or to cure disease or injury. The physician or surgeon prescribes these conditions—the nurse carries them out. Health is not only to be well, but to be able to use well every power we have to use. Sickness or disease is nature's way of getting rid of the effects of conditions which have interfered with health. It is nature's attempt to cure—we have to help her. Partly, perhaps mainly, upon nursing must depend whether nature succeeds or fails in her attempt to cure by sickness. Nursing is therefore to help the patient to live. Nursing is an art, and an art requiring an organised practical and scientific training. For nursing is the skilled servant of medicine, surgery, and hygiene.

Nursing proper means, besides giving the medicines and stimulants prescribed, or applying the surgical dressings and other remedies ordered, (1) the providing and the proper use of fresh air, especially at night—i.e. ventilation—and of warmth or coolness; (2) the securing the health of the sickroom or ward, which includes light, cleanliness of floors and walls, of bed, bedding, and utensils; (3) personal cleanliness of patient and of nurse, quiet, variety, and cheerfulness; (4) the administering and sometimes preparation of diet; (5) the administration of remedies. See NURSING.

Fever Hospitals, distinct from those for the treatment of surgical and ordinary medical cases, are essential for securing the isolation of patients in infectious diseases; hospital ships or floating hospitals have been found extremely valuable for securing complete isolation in cases of virulently infective disorders such as Small-pox (q.v.).

Poor-law Infirmaries.—Since 1870 poor-law or parish infirmaries for the sick and infirm, who used to be harboured (not treated) in workhouses and nursed by paupers, have been built, and are served by trained nurses. Some difference exists between the essentials for general hospitals and for poor-law infirmaries—the latter having no medical schools, no visiting or resident medical officers, except the resident medical superintendent and his assistant, no accidents or operations. The large majority of patients in them are chronic, not acute, cases, and incurables. A smaller nursing staff in proportion is needed. Some few of the best and largest have now training-schools for nurses. Since 1875 Metropolitan Board and Unions, supported also by the rates, have been built near London for fevers, for small-pox, for idiots and imbeciles, &c.

Lying-in Hospitals.—The lying-in hospitals require special consideration. The entire use of wards for this purpose appears to be very dangerous to the patients. Indeed this would seem to be the reason why there are fewer cases of ills from this cause in workhouse infirmaries than in the ordinary lying-in hospital, and why the lying-in at home is safer than either.

In Paris, where this subject has been much considered, two forms have been tried with good results. In one each patient has a small ward to herself, with its scullery or service-room attached, opening through a covered porch into an open veranda. After each confinement the ward is cleaned and lime-whited before further occupation. In these wards fatal results have been very rare. Another form is to have a ward which can hold two or more beds, in one of which the patient is brought for the delivery, and after a few hours she is wheeled out in the bed into a large ward where she remains with other patients who have also been delivered. With this plan also, where the delivery ward is cleaned and lime-whited at short intervals, and where two delivery wards are in use alternately, one always standing empty, fatal results have been rare. Instances of both forms of lying-in hospitals are not unknown in the United Kingdom. But it would be well if they were more universal.

Children's Hospitals must be provided with establishments for bathing, playing indoors and out,

large garden grounds, gymnastic grounds and halls, in and out of doors; the gymnastics should be under a professor, and out-patients should be always admitted. A 'sister' must superintend each of all these places. Singing in chorus is to be taught. It is a matter of universal hospital experience that intermingling of ages is essential. If you have a children's hospital, let the age of admission include fifteen years, especially on the female side. In all hospitals (in a child's hospital much more than in others) the patient must not stay a day longer than is absolutely necessary. Every child's hospital ought to have a *convalescent* branch at a distance; if possible by the sea. Sick children can never be left alone for a moment. One might almost say a nurse is required for every child. This is why in a general hospital it is much better for the children to be mixed with the adults; and, if they are judiciously distributed, it does the woman in the next bed as much good as it does the child, or the man as it does the little boy. If there *must* be a children's ward in a general hospital, let it be for the infants.

Convalescent Hospitals must be as like a home and as unlike a hospital as possible. A string of detached cottages is the best, admitting of extension by the addition of similar parts. Convalescent wards in a general hospital are not good; nor are day-rooms. Healthy open position and climate must be carefully selected. The convalescents are only to sleep at night in their rooms, while in the day they are 'out and about,' or occupying themselves—the men in the garden, the women at household work. But there must be strict discipline. There must be two small wards for relapses next the 'sister's' room, in the centre cottage. The convalescent beds may be divided by curtains, to be pulled far back in the day-time. A wash-hand stand to be permitted within—no lavatory. Three or four beds a good number for each convalescent room. Men and women should have separate cottages, and only meet at meals. Every hospital should have its convalescent branch, and every county its convalescent home.

Hospitals for Incurables should admit all diseases certified by competent medical judges to be hopelessly incurable—except mental diseases, which require special arrangements. One well-known hospital for incurables excludes epilepsy because it frightens the other patients; avoids, if possible, congenital and infantile disease; prefers patients of and above middle age; and excludes children and all under twenty years. The cases treated by incurable hospitals are principally cases of chronic rheumatism, gout, paralysis, and various affections which cripple the limbs, &c. These hospitals, while treating cases within their walls, are no doubt productive of great benefit to the community; but the system of granting pensions from the hospital funds to out-patients is very questionable.

A Samaritan fund is generally provided to assist poor patients leaving hospitals who may be deficient in clothing or other necessaries. In public *Dispensaries* (q.v.), at stated hours, medical advice and medicines are given gratis to applicants; in recent years provident dispensaries have been established, supported by subscriptions, entitling the subscriber to advice and medicine. Valuable establishments are those called in France *Maisons de Santé*—private hospitals for the reception and treatment of patients who are able and disposed to pay a small sum for board and medical or surgical attendance.

Hospital Sunday. On one Sunday in the year it is the practice for churches of almost every denomination in London and throughout the provinces to have special collections for the support of the hospitals of the country. In London the movement originated in 1873; Aberdeen claims to have begun the practice in 1764.

See Antiseptics, Disinfectants, Germ, Hygiene, Infection, Medicine, Nursing, Pyæmia, Surgery; Burdett, *Hospitals and Asylums of the World* (4 vols. 1893); Billings and Hurd, *Hospitals, Dispensaries, and Nursing* (1895); Mouat and Snell, *Hospital Construction and Management* (1884); Clifford Smith on *Administration of Hospitals* (1863); Douglas Galton, *Construction of Hospitals* (1870), and *Healthy Hospitals* (1893); Wylie, *Hospitals* (New York, 1877); the present writer's *Notes on Hospitals* (new ed. 1863), and *Lying-in Institutions* (1871); and such reports as those of the Commissions on the Sanitary Condition of Barracks and Hospitals (1863), on Regulations affecting the Sanitary Condition of the Army and Organisation of Hospitals (1858), and on Smallpox and Fever Hospitals (1882).

Hospodar, a Slavonic title once commonly given to the governors of Moldavia and Wallachia, whereas the king of Roumania is now known under the native Romanic title of *Domnu*. Lithuanian princes and Polish kings also bore the title.

Host (Lat. *hostia*, 'a victim'), the name given in the Roman Catholic Church to the consecrated bread of the eucharist. It is so called in conformity with the doctrine of that church that the eucharist is a 'sacrifice,' in the strict sense of the word, though, in the common language of Catholics, 'host' is used for the unconsecrated altar-bread, and even so occurs in the offertory of the Roman missal. The host in the Latin Church is a thin circular wafer (in Old English, 'syngeing cake') of unleavened bread, made of the finest flour, and bearing stamped upon it the figure of the Crucifixion or some emblematic device, as the Lamb, or the letters IHS. These are the 'points' and 'figures' forbidden in the first book of Edward VI. In all ancient liturgical rites the consecrated host was broken before being consumed by the priest. In the Roman Church the celebrant, who uses at mass a larger host than that reserved for other communicants, first breaks it into two halves, and then from one half detaches a fragment which he drops into the chalice. In the Greek and other oriental churches, as well as in various Protestant communities, the eucharist is celebrated in leavened bread; and one of the grounds of separation from the West alleged by Michael Cerularius was the western practice of using unleavened bread. The use of unleavened bread is founded on the belief that Christ can only have used such bread when instituting the eucharist at the Paschal feast. Luther followed the Roman Church in this point, but did not break the host. It was decided by the Privy-council, in the Purchas case (1871), that the use of the wafer is forbidden in the Church of England. The elevation of the host is the act by which the priest immediately after pronouncing the words of consecration raises the host with both hands above his head, whilst the server tinkles his bell to call attention to the ceremony, that the congregation may adore Christ present.

Hostage, a person given to an enemy as a pledge for the proper fulfilment of treaty conditions. Formerly the evasion of the terms of the treaty by one of the contracting parties used to be regarded as entitling the enemy to put to death the hostages that had been given up to them. The shooting of Archbishop Darboy (q.v.) and his fellow hostages in 1871 was the most execrable crime of the Paris Communists.

Hostilius, Tullus, the third of the legendary kings of Rome, succeeded Numa Pompilius in 670 B.C. He it was who made the famous arrangement by which the combat of the Horatii with the Curiatii decided the question of supremacy between Rome and Alba in favour of the former. He fought

against Fidenæ and Veii, and conquered them; and destroyed Alba, and removed the inhabitants to Rome, giving them Mount Celius to dwell on; and carried on war against the Sabines. At length the gods grew wrathful with him for his love of war and his neglect to worship them, and Jupiter Elicius consumed him and his house with fire about 638 B.C. According to Niebuhr and Arnold, there are glimpses of a distinct personality in the legend of Hostilius, unlike those of Romulus and Numa, which are merely personifications of the two principal stages of a nation's growth.

Hotbed, a bed of fermenting vegetable matter, usually surmounted by a glazed frame, employed in gardening for cultivating melons and cucumbers, the rearing of tender annuals, propagating stove and greenhouse plants by cuttings, seeds, or grafting, forcing flowers, &c. It is an inexpensive means for obtaining a high temperature in a limited atmosphere, accompanied with genial humidity charged with nutritious gases, which is very beneficial to plants. Formerly it was an indispensable adjunct to the garden, but the almost universal employment of hot water as a heating agent for horticultural purposes has latterly greatly circumscribed its use. The materials used in making hotbeds are stable-dung, leaves—those of the oak and beech, being especially suitable, are frequently mixed with the dung—tanners' bark, spent hops, and the waste of jute, cotton, hemp, and flax, all of which must be allowed to pass through the first violent stages of fermentation in order to eliminate the deleterious gases they contain before being built up into the bed. The size of the bed is regulated by the degree of heat required for the purpose in view. A bed of stable-dung with or without leaves intermixed, four feet thick, will for some time after it is built maintain a temperature of from 75° to 90°, which is sufficient for most purposes. As the fermentation declines the bed cools down, but heat is again readily increased by adding fresh material to the sides of it. The bed should be made a few inches wider and longer than the frame that is to be placed upon it, and from 6 to 9 inches higher at the back than the front to secure a better angle for light. See also PLANT-HOUSE.

Hotchpot (the same word as *Hotch-potch* in the culinary sense), a phrase used in English law to denote that, where one child has already received an advancement out of the father's estate, that child must bring such portion into hotchpot before he will be allowed to share with the other children, under the statute of distributions, after the father's death. In other words, a child who has got money from the father to place him in business, &c., must treat that as a payment to account of his share at the father's death. The eldest son is not required to bring into hotchpot the land which he takes as heir. A similar, but not identical, doctrine exists in Scotland under the name of collation.

Hotch-potch, a Scottish dish, may be defined as a kind of mutton-broth in which green peas take the place of barley or rice. *Hotch-potch* or *Hodge podge* is a corruption of Old English *hoch-pot*; Fr. *hochepot*; from Dutch *hutspot* (*hutsen* being 'to shake in the pot').

Hot Cross Buns. See CROSS BUNS.

Hotel (Fr. *hôtel*, Old Fr. *hostel*, Lat. *hospitale*), a superior kind of inn (see INN), like the old English *hostel*. The often palatial hotels that have sprung up since the introduction of railways are too well known to require notice. One point of difference between the European and the American systems is that under the former, except in the case of a *table d'hôte*, the charge is for each dish ordered, while under the American plan a fixed price is charged for every meal. The modern French word is still used for the house of a rich or distinguished man, or for a public building, such as the *Hôtel de Ville* (see MUNICIPAL ARCHITECTURE), as well as for inn or hostelry.

Hothouse. See PLANT-HOUSE.

Hot Springs, a town of Arkansas, 56 miles WSW. of Little Rock, is surrounded by fine mountain scenery, and is much frequented as a summer-resort. It has over fifty thermal springs, ranging in temperature from 95° to 148° F. Pop. 8086.

Hotspur, HARRY. See PERCY.

Hottentots, the people who were in possession of the greater part of what is now Cape Colony when it was first visited and colonised by Europeans. The Hottentots were so called by the earliest Dutch settlers, puzzled at their strange harsh faucal sounds and clicks, Hottentot or Hüttentüt signifying a quack in Frisian or Low German. It is a somewhat misleading name, as it is popularly used to include the two distinct families distinguished by their native names: the Khoikhoi, the so-called Hottentot proper, and the Sān (Sā) or Bushmen, between whom little charity exists. Again, among the Khoikhoi proper, the terms Hottentots, Hottentots proper, or Cape Hottentots are often applied to the remnants of the tribes who formerly lived around Capetown; while the inhabitants of Griqualand West, of the South Kalihari, and of Great Namaqualand are distinguished by their tribal names as Griquas, Namaquas, Koras or Koranas, as if they were not as much Hottentots as the Khoikhoi of Cape Colony. The Bushmen are hunters; the Khoikhoi, nomads and sheep-farmers. At the present time the so-called Hottentots proper may number about 17,000; and the half-breeds, mostly employed in the Cape Colony, may number probably 100,000. The majority of the former and almost all the latter class are now semi-civilised, and copy the habits, customs, dress, and vices of the European colonists. In general they are of medium height, not very robust in build, and have small hands and feet. Their skin is a pale brown colour; their hair woolly, growing in curly knots; their cheek-bones very prominent; and their chin pointed. The women are sometimes distinguished by certain organic peculiarities, and often have an enormous development of fat, especially in the breasts and hinder-parts. Their principal characteristics in former days were indolence and hospitality. Their favourite amusements were feasting, dancing, smoking, and singing. The men were herdsmen, and not fond of war, though they liked to hunt. The women, although held in high esteem, performed all the manual labour. Their dwellings were huts of wood and mats, or tents, disposed in circles, and easily transportable. Their manner of living was entirely patriarchal: each tribe or division of a tribe had its own chief. The method of perpetuating family names was that the sons took their mother's family name, whilst the daughters took their father's.

Their language embraced three principal dialects—the Nama, spoken by the Namaquas; the Kora, spoken by the Koranas; and the Cape dialect, now almost, if not entirely, extinct. Owing to its use of suffixes for expressing the declensions of nouns and the conjugations of verbs, the Hottentot language has been classed by Bleek, Lepsius, and other scholars with the Hamitic family of speech. This view is, however, controverted by Fr. Müller, Hahn, and Von Gabelentz, who maintain that the Hottentots and Bushmen are allied peoples, the aboriginal inhabitants of the greater part of South Africa. The association of the Bushmen with the Hottentots rests, however, upon little more than the

common possession of a few verbal roots and the common use of some harsh faucal sounds or 'clicks' in their manner of speech. These 'clicks' are four in number—a dental sound, usually represented by the sign |; a palatal, by ≠; a lateral, by ||; and a cerebral, by !. All the Khoikhoi idioms are distinguished by monosyllabic roots ending in a vowel, and the use of pronominal elements as suffixes for the purpose of forming derivatives. They possess no prefixes. One striking feature is a decimal system of counting.

They have both sacred and profane poetry, and hymns of both kinds are sung accompanied by the so-called reed-music or reed-dances, performed on reed or bark pipes. The sacred hymns are generally prayers, invocations, and songs of praise in honour of the supreme being Tsũi||goab, the beneficent deity Heitsi-eibib, and the Moon; while the profane reed-songs or dances deplore the fate of some dead chief or hero, or are sarcastic lessons to some one who has done something unpopular. They are often given by way of welcome to some guest worthy of honour, and in every large kraal there is a bandmaster, whose business it is to drill the young boys and girls in this music. Dr Hahn compares its effect to the harmonium. The chief divinities of the Khoikhoi, as has been seen, are the supreme being Tsũi||goab, who lives in the Red Sky; another beneficent being, Heitsi-eibib, considered as an ancestral deity, who came originally from the East; and ||Gaunab, an evil spirit, whose malignant influence has to be averted by prayers and charms, which furnish employment to troops of professional sorcerers. The mythology is rich, but singularly confused and difficult of interpretation. It contains also repulsive features enough, but not more so than the old Greek. Much more might have been known had well-meaning missionaries been more sympathetic or intelligent. Beyond the hymns spoken of, the popular imagination has originated, or at least retained, a great number of fables, as well as legends, proverbs, and riddles. One persistent feature in these is a strong inclination to personifications of impersonal beings. Speech and reason are freely imputed to the lower animals, and human-like agencies employed freely as causes of celestial and other natural phenomena. The first to give examples of these was Captain (afterwards Sir) James Alexander in his *Expedition of Discovery into the Interior of Africa* (2 vols. 1838). More were brought to light by Krönlein and other scholars, and in 1864 Dr W. H. I. Bleek gave a good selection in his *Reynard the Fox in South Africa: Hottentot Fables and Tales.*

For the language, see the grammars by Tindall (1871), Hahn (1870), Fr. Muller (*Grundriss der Sprachwissenschaft*, vol. ii. 1877), and Bleek (1862-69). For the people, see Dr Gustav Fritsch, *Die Eingeborenen Süd-Africas* (1872); and Dr T. Hahn's *Tsuni-goam: the Supreme Being of the Khoi-Khoi* (1882).

Hottentots' Bread. See DIOSCOREACEÆ.

Hottonia. See WATER-VIOLET.

Houdin, ROBERT (1805-71). See CONJURING.

Houdon, JEAN-ANTOINE, the greatest French sculptor of the 18th century, was born at Versailles, 20th March 1741. He was of humble origin, his father holding office in a nobleman's house. He was a born sculptor, and at the age of thirteen had already attracted notice. An untrammelled eclecticism was ever Houdon's most prominent characteristic. In 1761, when he was but twenty, he won the *prix de Rome*, and in Rome he threw himself with enthusiasm into the study of the antique. Herculaneum and Pompeii had not long been brought to light. All Winckelmann's works were published during Houdon's sojourn in Italy. Ten years he remained in Rome, and there executed the colossal figure of St Bruno, the founder of the order of the Chartreuse, of which Pope Clement XIV. said that it would speak did not the rules of its order enforce silence. On his return to France the usual official honours were conferred upon him. In 1777 he was received into the Academy; in 1796 he was elected member of the Institute; and he was appointed professor at the École des Beaux-arts in 1805. Apart from his work his life was singularly uneventful, though he once visited America under the escort of Franklin, to execute a monument in honour of Washington (1785). Nor did he altogether escape from the troubles of the Revolution. An allegorical figure from his hand, entitled 'Sainte Scholastique,' involved him in the heinous charge of desiring to perpetuate the worship of the saints. But on pleading that his statue only represented Philosophy, he was acquitted. Towards the end of his life his intellect failed him, and death came as a release, 16th July 1828. Houdon is perhaps the most conspicuous figure among the artists of his time. His mastery over his material was complete. So great were his technical skill and adroitness that they sometimes carried him beyond the bounds of his art. He had essayed all styles without sacrificing his personality, and, while much of his work has an almost classical simplicity, it was generally his method (in portraiture at least) to obtain a resemblance by an infinitude of details. It is a little strange that his 'Écorché' should be the most widely known of his works. For it was in portraiture that his greatest triumphs were achieved. Turgot, Rousseau, Voltaire, Diderot, Franklin, Washington, Lafayette, Mirabeau, Napoleon, and Mdlle. Arnauld are a few of the great men and women whose features he has perpetuated for us. In 1890 a statue of him was erected at Versailles at a cost of 10,000 francs.

Houghton, RICHARD MONCKTON MILNES, LORD, was born of a good old Yorkshire family at Fryston Hall, Pontefract, 19th June 1809. His father, 'single-speech Milnes' (1784-1858), of Fryston, Bawtry, and Great Houghton, declined the chancellorship of the exchequer and a peerage; his mother was a daughter of the fourth Lord Galway. Educated by private tutors at home and in Italy, he went up to Trinity College, Cambridge, where he graduated M.A. in 1831, and where he was a leader in the Union (then 'cavernous, tavernous'), and one of the famous band of 'Apostles.' From 1837 till 1863 he represented Pontefract, first as a Conservative, but latterly as an independent Liberal; and then he was called by Lord Palmerston to the Upper House, of which for a score of years he was 'the only poet.' In 1851 he married a daughter of the second Lord Crewe. She died in 1874; and he himself, having three years before had a passing attack of paralysis, died suddenly at Vichy, 11th August 1885. A Mæcenas of poets (and of poetasters), he got Lord Tennyson the laureateship, soothed the dying hours of poor David Gray, and was one of the first to recognise Mr Swinburne's genius. His own poetry is always respectable, and some of the shorter pieces were in their day exceedingly popular—'Strangers Yet,' for example, and the pretty lyric whose refrain is 'The beating of my own heart Was the only sound I heard.' Besides this, Lord Houghton—the 'Mr Vavasour' of Beaconsfield's *Tancred*—was a traveller, a philanthropist, an unrivalled after-dinner speaker, and Rogers' successor in the art of breakfast-giving. He went up in a balloon, and down in a diving-bell; he was the first publishing Englishman who gained access to the harems of the East; he championed oppressed nationalities, liberty of conscience, fugitive slaves, and the rights of women; he carried a bill for establishing

reformatories (1846); and he counted among his friends Hallam, Tennyson, Thackeray, Dickens, Carlyle, Sydney Smith, Landor, Cardinal Wiseman, Heine, Thirlwall, and a host of others.

Lord Houghton's works include *Memorials of a Tour in Greece* (1833); *Poems of many Years* (1838); *Memorials of a Residence on the Continent* (1838); *Poetry for the People* (1840); *Memorials of many Scenes* (1843); *Palm Leaves* (1844); *Life, Letters, and Remains of Keats* (2 vols. 1848); *Good Words and Good Manners* (1859); *Monographs, Personal and Social* (1873); and *Collected Poetical Works* (2 vols. 1876). See an article by T. H. S. Escott in the *Fortnightly* for September 1885, and the Life by Wemyss Reid (2 vols. 1890).

Houghton-le-Spring, a town in the county, and 6½ miles NE. of the city, of Durham. Its rapid growth is mainly due to the extension of neighbouring collieries. The fine cruciform parish church contains the cinque-cento altar tomb of Bernard Gilpin (q.v.), who founded a grammar school here, and among whose successors were Peter Heylin and Archbishop Sancroft. Pop. (1851) 3224; (1891) 6746.

Hound, a name applied to dogs used in hunting. The true hound, such as the Bloodhound, the Foxhound, and the Staghound, hunt only by scent. In this division may also be included the Basset-hound (a short-legged dog used in unearthing foxes and badgers), the Beagle, and the Harrier. The greyhound and the deerhound run by sight alone, and are not hounds in the correct acceptance of the term. See also FOX-HUNTING.

Hound's-tongue (*Cynoglossum*), a genus of plants of the natural order Boragineæ, of which there are many species, all of a coarse appearance, with small flowers. The Common Hound's-tongue (*C. officinale*) is a native of Europe, Asia, Africa, and North America; not uncommon in some parts of Britain, especially near the sea-coast. It has soft downy leaves, of a dull green colour, purplish-red flowers, and a stem about two feet high.

Hound's-tongue (*Cynoglossum officinale*).

Its odour is very disagreeable. The root was formerly administered in scrofula, dysentery, &c., and is said to be anodyne. It is also one of the pretended specifics for serpent-bites and hydrophobia.

Hounslow, a town of Middlesex, 10 miles W. by S. from London by road, was formerly a place of much importance in the old coaching days, it being the first stage out of London on the Bath and Southampton roads. As many as 800 horses were then maintained here, 500 coaches passed through daily, whilst a most extensive business in posting was carried on. With the opening of the railways, however, the place gradually declined, and at the present time it contains but little of interest. Its three churches are all modern, the oldest, rebuilt in 1835, having been formerly the chapel of a priory. West from Hounslow, stretching for 5 miles along the road, and in 1546 containing an area of 4293 acres, was Hounslow Heath, the scene of many military encampments, and notorious in the annals of highway robbery. It is now for the most part enclosed. Near to the town are extensive gunpowder-mills and cavalry and militia barracks, and at Kneller's Hall, once the residence of Sir G. Kneller, the painter, are the quarters of the Royal Military School of Music. Pop. (1851) 3514; (1871) 9294; (1891) 12,873, of which the barracks contained over 1000.

Hour, a measure of time equal to $\frac{1}{24}$th part of an astronomical day or to $\frac{1}{12}$th part of a natural day (excluding the hours of night or darkness). See DAY, and TIME; and for the hours in Catholic usage, see BREVIARY. *Hour circles*, in astronomy, are any great circles which cut the poles.

Hour-glass, an instrument for measuring intervals of time. It is made of glass, and consists of two bulbs united by a narrow neck; one of the bulbs is nearly filled with dry sand, fine enough to run freely through the orifice in the neck, and the quantity of sand is just as much as can run through the orifice in an hour, if the instrument is to be an hour-glass; in a minute, if a minute-glass, &c. The obvious defects of this instrument are the expansion or contraction of the orifice produced by heat or cold, and the variations in the dryness of the sand, all of which produce deviations from the true measurement of the time. The hour-glass was almost universally employed in churches during the 16th and 17th centuries. In several of the churches in England hour-glass stands of elegant workmanship are still to be seen.

Houri, the name of the beautiful damsels who, according to the Moslem faith, await with their companionship in Paradise the true believers after death. See MOHAMMEDANISM.

Housatonic River rises in Massachusetts, flows through Connecticut, and enters Long Island Sound near Bridgeport. In its course of nearly 150 miles it affords water-power to many manufacturing villages.

House, in point of law, is an Englishman's castle, though not a Scotchman's. In other words, when a man shuts himself up in his own house no bailiff can break open the door to arrest him, or seize his goods for debt, in England, and no court can give such power, except in the case of a writ of attachment for contempt of court or a writ of *habere facias possessionem* (the writ by which a judgment for the recovery of land is commonly enforced). In Scotland leave can be got from the court, often called on that account the king's or queen's keys, to enable the messenger to break open the outer door and arrest. In England, though it is not competent for the bailiff to break open the outer door by force, yet every trick or stratagem is fair in order to effect a peaceable entry, and once in he cannot be turned out. Where the party is charged with a criminal offence a constable armed with a warrant, or in some cases without, is entitled to break into the house and arrest him, both in England and Scotland. A man is entitled also to defend his house against trespassers and thieves, using no greater force than is necessary; and if necessary in that sense, he may even kill the intruder, though very strong circumstances are required to justify this. He may also

put spring-guns on the premises: but by doing so he may render himself liable to an action if any person lawfully entering the premises should be injured. In Scotland a peculiar name is given to the offence of feloniously assaulting a man in his own house, called Hamesucken (q.v.), a name also used in the old law of England; and all offences committed in another person's house are generally punished more severely than those not committed in a house at all. See also EVICTION.

House-boat. See BARGE.

Housebote. See ESTOVER.

Housebreaking is the breaking and entering into a dwelling-house, shop, or warehouse, between the hours of 6 A.M. and 9 P.M., and stealing any chattel or money to any value. The drawing a latch, the opening a window, or the employment of fraudulent means to effect an entry constitutes *breaking and entering*. The punishment ranges from fourteen years' penal servitude to two years' imprisonment. See BURGLARY, where the law in the United States is also noticed.

Housebreaking. See ARSON.

House-fly (*Musca domestica*), perhaps the most familiar and widely distributed dipterous insect. Adults are to be seen the whole year round, though naturally most numerous in summer. They feed indiscriminatingly on whatever they can suck up through their fleshy proboscis or scrape off with their other mouth parts. The females lay their eggs in groups, about eight days after pairing, and the whole development occupies about a month. The eggs are deposited in decaying organic matter, in dung, or in any filth, and the larvæ are hatched in a day, or even less if the weather be warm. These larvæ are smooth, naked maggots, without legs or distinct head, with small hooklets at the mouth, and a length of about one-third of an inch. They feed on organic debris, move by contracting the abdomen, and grow for about a fortnight. Then they seek some dry resting-place, undergo pupation, and finally in another fortnight become winged insects.

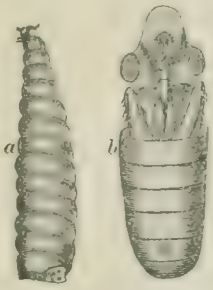

Fig. 1.

a, larva of house-fly, with breathing-pores at tail (greatly enlarged); *b*, young fly emerging from pupa-sheath.

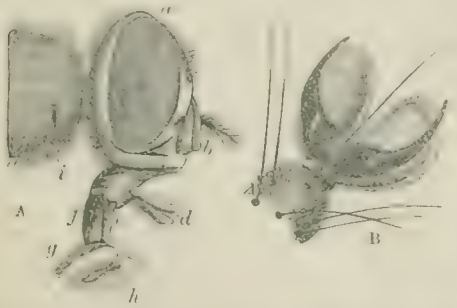

Fig. 2.

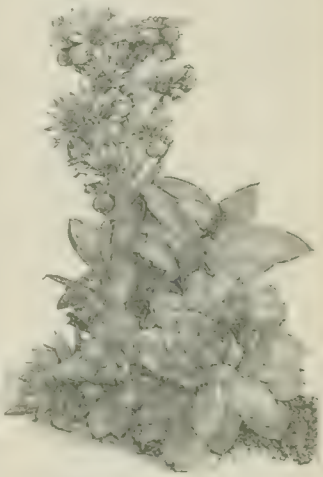
A, head of house-fly: *a*, compound eye; *b*, antennæ; *d*, maxillary palps; *e*, *f*, 'proboscis;' *g*, labellæ, lips of 'proboscis;' *h*, opening into 'proboscis;' *i*, thorax, with breathing-pore (after Von Hayek). B, end of a fly's foot, highly magnified, showing long hairs, two terminal claws, and two membranous adhesive pads.

Many parts of the house-fly, such as the sucking proboscis, or the hair-covered discs of the feet by which the insects adhere to the window-pane, well deserve the attention they generally get from those who use the microscope. Though house-flies do not bite, they are often extremely troublesome. Expedients for killing them off require no advertisement. It is more important to notice that house-flies are probably sometimes responsible for disseminating disease-germs.

Household. THE KING'S OR QUEEN'S, in Great Britain comprises the departments of the Lord Steward (q.v.), the Lord Chamberlain (q.v.), with the Lords of the Bedchamber, a medical department, the Royal Almonry, and the department of the Mistress of the Robes, which comprises the Ladies of the Bedchamber, the Bedchamber Women, and the Maids of Honour. For the Lords and Ladies of the Bedchamber, see BEDCHAMBER (see also ROYAL FAMILY). The *Maids of Honour*, of whom there are eight, are immediate attendants on the royal person, and in rotation perform the duty of accompanying the Queen on all occasions. They enjoy by courtesy the title 'Honourable,' when not entitled to it by birth, and are then designated the 'Honourable Miss ——' without the Christian name.

Household Troops are those troops whose especial duty it is to attend the sovereign and to guard the metropolis. These forces comprise three regiments of cavalry—the 1st and 2d Life Guards and the Royal Horse Guards; and three regiments of foot—the Grenadier Guards of three battalions, and the Coldstream and Scots Guards of two battalions each. See GUARDS.

House-leek (*Sempervivum*), a genus of plants of the natural order Crassulaceæ, having a calyx of six to twenty sepals, the petals equal in number to the sepals, and inserted into the base of the calyx; the leaves generally very succulent, and forming close rosettes. The Common House-leek or Cyphel (*S. tectorum*), called *Fous* or *Fouds* in Scotland, and in some countries *Jupiter's Beard*, grows wild on the rocks of the Alps, but has long been common in almost every part of Europe, planted on walls, roofs of cottages, &c. It sends up leafy flowering stems of 6 to 12 inches in height, bearing branches of pale red star-like flowers, equally curious and beautiful. The leaves cut or bruised and applied to burns afford immediate relief, as they do also to stings by bees or wasps; and they are beneficial when applied to ulcers and inflamed sores. They were formerly in high esteem as a remedy for fevers and other diseases; and an edict of Charlemagne contributed greatly to the extensive distribution of the plant. The edict is in these words: *Et habeat quisque super domum suam Jovis barbam* ('And let everybody have the



Common House-leek (*Sempervivum tectorum*).

Jupiter's beard on his house'. Other species possess similar properties. *S. sobolifera*, with yellowish green flowers, is very frequently planted on walls in Germany. The fishermen of Madeira say that nets rubbed with the fresh leaves of *S. glaucum* are thereby rendered as durable as if tanned, provided they are also steeped in some alkaline liquor. Some of the species, natives of the south of Europe, Canary Isles, &c., are shrubby; others are common greenhouse plants.

Housemaid's Knee is the term commonly applied to an acute or chronic inflammation of the bursa or sac that intervenes between the patella, or knee-pan, and the skin. Housemaids are especially liable to it from their kneeling on hard damp stones. In its acute form it causes considerable pain, swelling, and febrile disturbance. The only disease for which it can be mistaken is inflammation of the synovial membrane lining the cavity of the joint; but in this disease the patella is thrown forwards and the swelling is at the sides, while in housemaid's knee the swelling is very superficial, and is in front of the patella. The treatment in the acute form consists essentially in the means usually employed to combat inflammation—viz. rest, leeches, fomentations, and purgatives; if suppuration take place the sac must be freely opened and the pus evacuated. The chronic form may subside under rest, blisters, &c., or it may require incision or excision for its cure.

House of Lords, Commons. See PARLIAMENT.

House-rents. See LANDLORD AND TENANT.

Housing of the Poor. A Royal Commission to inquire into the condition of the working-classes sat in 1884 and 1885. Acts for facilitating improvement in the dwellings of the working-classes have been passed in 1868, 1875, and 1879. See GUINNESS, HILL, PEABODY; as also COTTAGE, LABOURERS, LODGING-HOUSE, POOR.

Houssa. See HAUSSA.

Houston, capital of Harris county, Texas, on the navigable Buffalo Bayou, 49 miles by rail NW. of Galveston, with which it is connected also by steamboats. It is the great railway centre of the state, stands in the midst of a fertile country, and ships large quantities of cotton, grain, and cattle, besides the products of the great pine-forests, which are prepared here. The other manufactures include machinery, iron-castings, railway carriages, farming implements, fertilisers, cotton-seed oil, &c. Pop. (1870) 9382; (1880) 18,646; (1890) 27,557.

Houston, SAMUEL, president of Texas, was born in Rockbridge county, Virginia, March 2, 1793, was brought up near the Cherokee territory in Tennessee, and was adopted by one of the Indians there. In 1813 he enlisted as a private soldier, and by persistent bravery rose to the rank of second-lieutenant before the end of the war. He left the army in 1818, studied law at Nashville, and was elected in 1823 and 1825 a member of congress, and in 1827 governor of Tennessee. In January 1829 he married the daughter of an ex-governor; but in the following April, for reasons never made public, he abandoned wife, country, and civilisation, and spent three years among the Cherokees, beyond the Mississippi, where his adoptive father had settled. In 1832 Houston went to Washington, and procured the removal of several United States Indian agents on charges of fraud, but got into personal difficulties with their friends. The Texan war offered a new field to his ambition. He was made commander-in-chief. The Americans at first sustained some severe losses, but on 21st April 1836 Houston with 750 men inflicted a crushing defeat on a force of 1800 Mexicans under Santa-Anna, on the banks of the San Jacinto, and by this one decisive blow achieved the independence of Texas. The hero of San Jacinto was elected first president of the republic, and re-elected in 1841, and on the annexation of Texas, in 1845, was elected to the United States senate. Elected governor of Texas in 1859, he opposed secession, was deposed in March 1861, and took no further part in public affairs. He died 26th July 1863.

Hovas. See MADAGASCAR.

Hovedon, ROGER OF, an old English chronicler, most probably born at Howden, in Yorkshire, who was attached to the household of Henry II., and was employed in missions to the lords of Galloway and to the heads of the monastic houses. In 1189 he was appointed an itinerant justice for the forests in the northern counties, and he seems to have spent his last years in Yorkshire, probably at Howden. It may be supposed that he did not survive 1201, as his *Chronica* ends with that year. It commences with the close of the Chronicle of Bede in 732, and is divided by Bishop Stubbs into four parts: the *first*, ending with 1148, consisting chiefly of the *Historia post Bedam;* the *second*, ending with 1169, mainly based on the *Melrose Chronicle;* the *third*, ending with 1192, mainly an abridgment of Benedict's *Chronicle;* and the *fourth*, ending with 1201, a record of contemporary events, not without value. The *Chronicle* was first printed in Sir H. Saville's *Scriptores post Bedam* in 1596. There is an English translation by H. F. Riley in Bohn's 'Antiquarian Library' (2 vols. 1853). The original forms 4 volumes (1868–71) in the Rolls series, under the editorship of Bishop Stubbs.

Howard. The noble House of Howard has stood for many centuries at the head of the English nobility. The Howards have enjoyed the dukedom of Norfolk since the middle of the 15th century, and have contributed to the annals of the nation several persons of the most distinguished character both in politics and in literature. Neither Sir W. Dugdale nor Collins claims for the Howards any more ancient origin than Sir William Howard, a learned Chief-justice of the Common Pleas under Edward I. and Edward II., though Dugdale incidentally mentions a tradition that their name is of Saxon origin, and derived either from an eminent office under the crown before the Conquest, or from Hereward, the leader of those forces which for a time defended the isle of Ely so valiantly against William the Conqueror. The pedigree earlier than Sir William Howard has been completely demolished in an article on 'Doubtful Norfolk Pedigrees' printed in the *Genealogist*. Be this as it may, it is certain that Sir John Howard, the grandson of the above-mentioned judge, was not only admiral and captain of the king's navy in the north of England, but sheriff of Norfolk, in which county he held extensive property, which was subsequently increased by the marriage of his grandson, Sir Robert, with the co-heiress of the ancient and noble House of Mowbray, Dukes of Norfolk. The only son of this union was Sir John Howard, one of the leading supporters of the House of York, who, having gained early distinction in the French wars of Henry VI., was constituted by Edward IV. constable of the important castle of Norwich, and sheriff of Norfolk and Suffolk. He subsequently became treasurer of the royal household, obtained 'a grant of the whole benefit that should accrue to the king by coinage of money in the City and Tower of London, and elsewhere in England;' and further, was raised to the peerage as Lord Howard and Duke of Norfolk. We find him in 1470 made captain-general of the king's forces at sea, and he was

most strenuous in that capacity in his resistance to the House of Lancaster. Finally he was created Earl Marshal of England, an honorary distinction still borne by his descendants, and in 1484 was constituted Lord Admiral of England, Ireland, and Aquitaine. He fell next year, however, on Bosworth Field, and after his death his honours were attainted, as also were those of his son Thomas, who had been created Earl of Surrey. The latter, however, after suffering three years of imprisonment in the Tower of London, obtained a reversal of his own and his father's attainders, and, being restored to his honours accordingly, became distinguished as a general, and is more particularly celebrated in history for his defeat of the Scotch at Flodden in 1513. His son Thomas, third Duke of Norfolk, was attainted by Henry VIII., but was afterwards restored in blood, and by his marriage with a daughter of King Edward IV. became the father of the ill-fated and accomplished Earl of Surrey (q.v.), whose execution was the last of the many acts of tyranny which disgrace the memory of Henry VIII. The same sentence had been passed on the duke, when the death of the royal tyrant saved him from the block. His grandson Thomas, fourth Duke of Norfolk, in like manner suffered attainder, and was executed on Tower Hill for high-treason, for his communication with Mary, Queen of Scots. The family honours, however, were again restored, partly by James I. to his grandson, and partly by Charles II. to his great-great-grandson, Thomas, who thus became eighth duke, and whose cousin and successor, Charles, ninth duke, was the direct ancestor of the present Duke of Norfolk.

It would be impossible here to give a list of all the honours which from time to time have been conferred on various branches of the ducal House of Howard; it is sufficient to say that, in one or other of their widespread branches, the Howards either have enjoyed within the last three centuries, or still enjoy, the earldoms of Carlisle, Suffolk, Berkshire, Northampton, Arundel, Wicklow, Norwich, and Effingham, and the baronies of Bindon, Howard de Walden, Howard of Castle Rising, and Howard of Effingham.

It will be seen from the above remarks that the ducal House of Norfolk is one whose fate it has been, beyond all others among the English nobility, to find its name interwoven with the thread of English history, and not rarely in colours of blood. The accomplished but unfortunate Surrey, and his scarcely less unhappy father, Thomas Howard whose head was only saved from the block on which his son so nobly suffered by the death of the eighth Henry—are 'household words' in the pages of English history; and readers of Shakespeare will have other recollections of the same name allied with other historical events; while those who are familiar with the writings of Pope will not have forgotten how tersely and pointedly he typifies the glory of ancestral pedigrees by 'All the blood of all the Howards.' Other members of the House of Howard have gained a place in the pages of English history. Sir Edward Howard, K.G., brother of the first Earl of Surrey, was made by Henry VIII. the king's standard-bearer and admiral of the fleet, in which capacity he lost his life in boarding a French vessel off Brest in action in 1513; his brother, Sir Edmund, acted as marshal of the horse at Flodden; and his half-brother, Sir Thomas Howard, was attainted, and died a prisoner in the Tower, for aspiring to the hand of the Lady Margaret Douglas, daughter of Margaret, Queen of Scotland, and niece of Henry VIII., one of whose ill-fated consorts was the Lady Catharine Howard.

Howard, CATHARINE, fifth queen of Henry VIII., was a granddaughter of the second Duke of Norfolk. The year of her birth, not known with certainty, was probably 1521 or 1522. Catharine was brought up partly in her father's house, partly in that of her grandmother, the Duchess of Norfolk. In 1540 the king married Anne of Cleves. But it was a marriage for which he had no liking; and Gardiner, the Roman Catholic Bishop of Winchester, being just then recalled to favour, he and his party endeavoured to bring the king and Catharine together. Anne of Cleves was divorced on the 9th of July, and Henry married Catharine Howard on the 28th of the same month. But in November the queen was accused to Henry of having been guilty of immoral conduct with two gentlemen of her grandmother's household, but previous to her marriage with the king. The evidence against her was convincing, and on this charge she was beheaded on 13th February 1542.

Howard, JOHN, the philanthropist and prison reformer, was born at Hackney, in Middlesex, on 2d September 1726, though both place and date are given differently by different authorities. His education was mostly got through private tuition. The inheritance of an ample fortune, which fell to him on the death of his father in 1742, enabled him to gratify his taste for continental travel. In 1756, after his wife's death, he set sail for Lisbon, which had just been devastated by the great earthquake, but was captured on the way by a French privateer, and carried to Brest, where he was thrown into prison. There even a short captivity sufficed to leave upon his mind a lasting impression of the inhuman treatment to which prisoners of war were subjected in French prisons. After his return home Howard married a second time, and settled at Cardington, 3 miles from Bedford. That village reaped the first-fruits of those philanthropic exertions which afterwards culminated in such noble labour, the work of prison reform. In 1773 Howard was nominated high-sheriff for the county of Bedford, and his interest in prisons and their inmates was now first fairly roused to the pitch of practical effort. He was struck with the injustice under which many poor prisoners suffered, in that they were detained in prison untried, or even after being pronounced innocent, until they or their friends had paid certain fees to the gaolers and other officials. Howard at once began a long series of tours throughout Great Britain and Ireland, for the purpose of investigating the condition of prisons, and inquiring into the management and treatment of prisoners. Chiefly as the result of his efforts, two acts were passed in 1774, one making provision for fixed salaries to be paid to the gaolers, and the other enforcing greater cleanliness in prisons, with a view to the prevention of the dreaded gaol-fever. From this time onward Howard prosecuted with unwearied zeal and patience this the great work of his lifetime, upheld by an indomitable sense of duty, and supported by a devout faith and his own firm, steadfast will. The remaining years of his life were principally spent in visiting the prisons of Great Britain and the countries of the Continent. Amongst the graver abuses he set himself to get abolished in his native land were such things as these: many prisons were in a deplorably dilapidated state, the cells narrow, filthy, and unhealthy; debtors and felons were confined promiscuously in the same prisons; separate apartments were not provided for the two sexes, and the gaolers were allowed to sell liquors to those placed under their charge, causes directly ministering to immorality and drunkenness. Howard's endeavours to relieve human suffering in prisons easily turned his thoughts to hospitals; and he also directed his efforts to the alleviation of suffering and the removal of abuses in these establishments, as well as in schools and all kinds of benevolent institutions. From 1785 he devoted his attention

more especially to the plague, and to the consideration of means for its prevention. With this end in view, he studied it in the hospitals and lazarettos of the chief Mediterranean towns in which it was wont to show itself. But whilst still pursuing his investigations, he was himself struck down by typhus fever at Kherson, in Russia, and died on 20th January 1790. He was buried at Dophinovka (now Stepanovka), 4 miles N. of Kherson. The chief results of his extensive observations were recorded with faithful accuracy and great minuteness of detail, though with little sense of generalisation, in two works—*The State of Prisons in England and Wales, with an Account of some Foreign Prisons* (1777), to which a supplement was added in 1780, whilst the editions of 1784 and 1792 were each an enlargement on its predecessor; and *An Account of the Principal Lazarettos in Europe* (1780). In consequence of his noble self-denying labours Howard has become the proverbial ideal of a philanthropist, the type of the best kind of humanitarian activity and love. Burke, in speaking of his labours at Bath in 1781, said, 'He has visited all Europe, not to survey the sumptuousness of palaces or the stateliness of temples; not to make accurate measurements of the remains of ancient grandeur, nor to form a scale of the curiosity of modern art; nor to collect medals or collect manuscripts; but to dive in the depths of dungeons, to plunge into the infection of hospitals, to survey the mansions of sorrow and pain, to take the gauge and dimensions of misery, depression, and contempt, to remember the forgotten, to attend to the neglected, to visit the forsaken, and to compare and collate the distresses of all men in all countries. . . . It was a voyage of discovery, a circumnavigation of charity.' See Lives by Baldwin Brown (1818), Taylor (1836), Hepworth Dixon (1849), Field (1850), and Stoughton (1853; new ed. 1884); *Correspondence of Howard* (1855) by J. Field; and the article PRISONS.

Howard, OLIVER OTIS, an American general, was born at Leeds, Maine, 8th November 1830, graduated at West Point in 1854, took command of a regiment of Maine volunteers in 1861, and was made brigadier-general for gallantry at the first battle of Bull Run. He lost an arm at Fair Oaks in 1862, but afterwards was in several actions, and in 1864 commanded the Army of the Tennessee in the invasion of Georgia. He commanded the right wing of Sherman's army in the march to the sea and through the Carolinas. He was commissioner of the Freedmen's Bureau from 1865 until its abolition in 1874, and was the first president of Howard University (see WASHINGTON, D.C.), which was named in his honour. He conducted two Indian campaigns, in 1877 and 1878; in 1886 he was promoted to major-general, and received the command of the division of the Pacific; in 1889 he was transferred to that of the Atlantic. General Howard is a chevalier of the Legion of Honour (1884). He has published several books, including *Chief Joseph* (1881), an account of his campaign against the Nez Perces.

Howard of Effingham, CHARLES, LORD, was born in 1536, and in 1573 succeeded his father, who was the ninth son of the second Duke of Norfolk, and who in 1554 had been raised to the peerage and been made Lord High Admiral. In 1585 that dignity was conferred on the son, and as such in 1588 he commanded gloriously against the Armada (q.v.). For his share with Essex in the Cadiz expedition (1596) he was created Earl of Nottingham, and in 1601 he put down Essex's mad insurrection. In 1619 he resigned his office in favour of Buckingham; and he died 14th December 1624. Contrary to the common opinion, there is no proof that he was ever a Catholic (*Notes and Queries*, 1851, 1888).

Howe, ELIAS (1819–67), inventor of the Sewing-machine (q.v.).

Howe, JOHN, the most philosophic of the Puritan divines, was born 17th May 1630, at Loughborough, in Leicestershire, to the living of which parish his father had been presented by Laud. He studied both at Oxford and Cambridge, where he made the friendship of the most distinguished professors and students of that day. After preaching for some time at Winwick, in Lancashire, and Great Torrington, in Devonshire, with much acceptance, he was appointed domestic chaplain to Cromwell in 1656, a position he occupied with great reluctance, but in which he discharged his difficult duties with rare firmness and courtesy, not fearing to speak his mind before Cromwell himself, and winning praise even from the enemies of his party. Indeed, throughout life he was on the most intimate terms with persons so wide apart as Baxter and other nonconformist divines, and the most distinguished ornaments of the Establishment, as Stillingfleet and Tillotson. At the Restoration he returned to Torrington, where he remained for about two years. But the Act of Uniformity ejected him from his parish, 24th August 1662; for though one of the most liberal-minded of the Puritans, and not troubled with morbid conscientiousness, he was also a man of strong principle. Like many others of the nonconformist ministers, he wandered about preaching in secret till 1671. In 1668 he published his first work, *The Blessedness of the Righteous*, which was very popular. In 1671 he was invited by Lord Massereene, of Antrim Castle, in Ireland, to become his domestic chaplain, where he spent four years of great happiness, preaching every Sabbath at Antrim church, with the sanction of the bishop. Here he wrote his *Vanity of Man as Mortal*, and began his greatest work, *The Good Man the Living Temple of God* (1676–1702), which occupies one of the highest places in Puritan theology. In 1675 he was called to be pastor of the dissenting congregation in Silver Street, London, and went thither in the beginning of 1676. In 1677 he published, at the request of Mr Boyle, *The Reconcileableness of God's Prescience of the Sins of Men with the Wisdom of His Counsels, and Exhortations;* in 1681, *Thoughtfulness for the Morrow;* in 1682, *Self-dedication;* in 1683, *Union among Protestants;* and in 1684, *The Redeemer's Tears wept over Lost Souls.* In 1685 he was invited by Lord Wharton to travel with him on the Continent; and after visiting the principal cities, he resolved, owing to the state of England, to settle for a time at Utrecht, where he was admitted to several interviews with the Prince of Orange. In 1687 the Declaration for Liberty of Conscience induced him to return to England, and at the Revolution next year he headed the deputation of dissenting clergymen when they brought their address to the throne. Besides smaller works, he published, in 1693, *Carnality of Religious Contention;* in 1694–95, several treatises on the Trinity; in 1699, *The Redeemer's Dominion over the Invisible World;* and he continued writing till 1705, when he published a characteristic work, *Patience in Expectation of Future Blessedness.* He died 2d April 1705.

Howe was a man of a noble presence, with a finely-balanced mind, a profound thinker, yet gifted with great practical sagacity. His own convictions were very decided, yet he had large toleration for the opinions of others, and of one of his persecutors writes 'he did not doubt after all to meet him one day in that place where Luther and Zwinglius well agreed.' The value of his writings is greatly marred by a poor style and innumerable subdivisions and

digressions, which led a woman once to say 'he was so long laying the cloth that she always despaired of the dinner.' But Robert Hall said of him, 'I have derived more benefit from the works of Howe than from those of all other divines put together.' A great admirer of Plato, 'though without the slightest pretension to the eloquence of the renowned Grecian, he bore no mean resemblance to him in loftiness of mind, sublimity of conception, and, above all, in intense admiration of all moral excellence.' 'Of the consummate ability with which he must have conducted himself no other proof is needed than the statement of the following facts: that he was often employed in the most delicate affairs by Cromwell, yet without incurring either blame or suspicion; without betraying confidence or compromising principle; that, though exposed to scrutinising eyes, he left not a rivet of his armour open to the shafts either of malice or envy, and that he could awe Cromwell into silence and move Tillotson to tears; that he never made an enemy and never lost a friend.' His works were published in 1724, 2 vols. folio, with a life by Dr Calamy; more than one edition has been published since. See H. Rogers' *Life of John Howe* (1836), and the short monograph by R. F. Horton (1896).

Howe, RICHARD HOWE, EARL, admiral, son of Viscount Howe of the Irish peerage, was born in London, 8th March 1726. He left Eton at thirteen, and, entering the navy, served under Anson (q.v.) against the Spaniards in the Pacific. Made post-captain at twenty, he in that same year drove away from the coast of Scotland two French ships conveying troops and ammunition to the young Pretender. After serving off the coast of Africa, Howe took an active part in the naval operations of the British during the Seven Years' War, especially distinguishing himself by the capture of the island of Chaussey, in the attacks upon the isle of Aix, St Malo, and Cherbourg, and in engagements with the French fleet in 1755 and 1759. In 1758 he succeeded to the Irish title of viscount on the death of his brother, George Augustus (1724–58), the brigadier-general, who was killed before Ticonderoga. Appointed a Lord of the Admiralty in 1763, he was promoted two years later to the important office of Treasurer of the Navy. In 1778 he defended the American coast against a superior naval force under D'Estaing, whom he repelled off Rhode Island. He was made a viscount of Great Britain in 1782. Being sent out the same year to relieve Gibraltar, he disembarked troops, ammunition, and supplies, and then offered battle to the combined fleets of France and Spain, but they, declining an engagement, drew off towards Cadiz. Howe was made First Lord of the Admiralty in 1783, and received an English earldom in 1788. When war with France broke out in 1793 he took command of the Channel fleet, and next year gained off Ushant the victory which is known as that of 'the glorious first of June.' The French fleet consisted of twenty-six ships of the line, and the British of twenty-five. In a very short time the latter captured seven of the enemy's vessels and dismasted ten more. Howe's last public service was to bring back to their duty the mutinous seamen at Spithead and Portsmouth in 1797. He died August 5, 1799, leaving the reputation of being a thorough seaman, cautious, cool and intrepid in danger, and considerate of his men. He greatly increased the efficiency of the navy by the introduction of a new system of evolutions and naval tactics. See Lives by G. Mason (1803) and Sir J. Barrow (1838).—Another brother, WILLIAM (1729–1814), held a command under Wolfe at Quebec, succeeded General Gage in 1775 as commander-in-chief of the British forces in America, commanded at Bunker Hill, took New York, defeating Washington at White Plains and at Brandywine, but was superseded by Sir Henry Clinton in 1778, for having lost the opportunity of destroying the American force at Valley Forge. He subsequently held various honorary commands in Britain, and succeeded to his brother's viscounty in 1799.

Howe, SAMUEL GRIDLEY, M.D., an American philanthropist, was born in Boston, November 10, 1801, and graduated at Brown University in 1821, and at the Harvard medical school in 1824. He served as a surgeon during the Greek war of independence from 1824 to 1827, organising the medical staff of the Greek army. He then went to America to raise contributions, and, returning with food, clothing, and supplies, formed a colony on the isthmus of Corinth. Swamp-fever, however, drove him from the country in 1830. In 1831 he went to Paris to study the methods of educating the blind, and, having become mixed up in the Polish insurrection, spent six weeks in a Prussian prison. On his return to Boston he established a school for the blind, his most famous pupil being Laura Bridgman (q.v.). He also established a school for the training of idiots. In 1851-53, assisted by his wife, he edited the anti-slavery *Commonwealth*, and, after revisiting Greece in 1867 with supplies for the Cretans, he edited in Boston *The Cretan*. He died 9th January 1876.—His wife, JULIA WARD HOWE, born in New York city, 27th May 1819, became prominent in the woman-suffrage movement since 1869, preached in American Unitarian pulpits, and published, besides narratives of travel and a Life of Margaret Fuller, several volumes of poems, *Passion Flowers* (1854), *Words for the Hour* (1857), and *Later Lyrics* (1866), the last the best. In 1861 she wrote the 'Battle-hymn of the Republic.'

Howell, JAMES, whose *Familiar Letters* is still an English classic, was born in July 1593, son of the minister of Abernant, in Carmarthenshire, studied at Hereford and Jesus College, Oxford, and took his B.A. in 1613. He then became steward to a glass-ware manufactory, and traversed in its interests Holland, Flanders, Spain, France, and Italy. He was next employed abroad on public business in 1626, became secretary to Lord Scrope at York, was returned to parliament for Richmond in 1627. From 1632 to 1642 he was mainly employed as a royalist spy; and in 1642 (when he was appointed an extra clerk to the Privy-council) he was sent by the parliament to the Fleet, where he lay till 1650. At the Restoration the office of historiographer-royal was created for him. He died in 1666, and was buried in the Temple church. Howell was a man of considerable humour, learning, and industry. Besides translations from Italian, French, and Spanish, he wrote no less than forty-one original works on history, politics, and philological matters. He had put his travels to much profit. 'Thank God,' he says, 'I have this fruit of my foreign travels, that I can pray unto him every day of the week in a separate language, and upon Sunday in seven.' His *Instructions for Forreine Travell* (1642) is still interesting, and is reprinted in Professor Arber's series (1869); and his supplement to Cotgrave's French and English dictionary maintains its interest for lexicographers; but it is by his *Epistolæ Ho-Elianæ: or Familiar Letters, Domestic and Forreign* (1645–55; 10th ed. 1737), that his name continues to be remembered. These display not only shrewd sense and brilliant wit, but also grace and form, and indeed are the earliest letters in our language that are really literary.

Dr Jacobs, the modern editor of Howell's *Letters*, says of him at length in a preface dated by Mr Joseph Jacobs in 1892.

Howell's State Trials, the name given to the [illegible] edited by Cobbett, in 1809,

because vols. xi. to xxi. of this work were edited by Thos. Bayly Howell (1768–1815), and vols. xxii. to xxxiii. by his son, Thos. Jones Howell (died 1858).

Howells, William Dean, a popular American novelist, was born at Martin's Ferry, Ohio, 1st March 1837. His father's family was of Welsh Quaker origin, and he himself was brought up a Swedenborgian. From an early age he was familiar with press work, as his father was a busy and not always prosperous printer and journalist; but his earliest serious work in journalism was in the Cincinnati *Gazette* and Columbus *State Journal*. A life of Lincoln, written in 1860, procured him the post of consul at Venice, which he held from 1861 to 1865, making himself master of Italian the while, and writing his able papers, collected in *Venetian Life* (1866). After his return to America he wrote for the New York *Tribune* and the *Times*, the *Nation*, and the *Atlantic Monthly*, and filled the editor's chair of the last from 1872 till his retirement in 1881. His later work in periodicals was done for the *Century* and *Harper's Magazine*. He had already made his mark as a first-rate journalist, a fair poet, and a clever critic, when in 1871 he found his real work as a writer of fiction. His clever story, *Their Wedding Journey*, at once brought him popularity which quickly grew in England no less than America, as the growing merit of succeeding novels made it more and more deserved. Of these the best are *A Chance Acquaintance* (1873), *A Foregone Conclusion* (1874), *A Counterfeit Presentment* (1877), *The Lady of the Aroostook* (1878), *The Undiscovered Country* (1880), *Doctor Breen's Practice* (1883), *A Modern Instance* (1883), *A Woman's Reason* (1884), *The Rise of Silas Lapham* (1885), *An Indian Summer* (1886), *Annie Kilburn* (1888), *A Hazard of New Fortunes* (1889), and *The World of Chance* (1893).

These works reveal their author to us as an artist of great conscientiousness and industry, but of decided shortcomings as well as gifts. He is humorous, brilliant, epigrammatic, and acute, but he cannot tell a story, and his ambitious analysis of commonplace characters is overdone to the extent of tediousness. With all his gifts he is not a great artist in fiction, and he lacks that rare combination of sympathy and humour which gave George Eliot and Mrs Gaskell their insight into what was really generic and human at the heart of the trivialities of everyday life. Howells wastes his strength on the over-elaboration of details, but too often these are not the really significant, and thus the general effect of the whole portrait is feeble, indistinct, and unsatisfactory. His over-elaborated rather than really refined Bostonians, and his Americans expanding spiritually under the new conditions of an ancient civilisation in some Italian city are always carefully painted and indeed striking portraits, but almost always they fall a little short of the one thing needful—that look of the life which is creation, and which evidently demands the intuition of genius to catch.

Howietoun. See Pisciculture.

Howitt, William and Mary, whose writings charmed, interested, and instructed the public during the earlier half of the 19th century, may best be treated together. William Howitt, the son of a land-surveyor of good descent, a member of the Society of Friends, was born at Heanor, Derbyshire, in 1792, and was educated at Ackworth and Tamworth. With no intention of pursuing the business, he served a four years' apprenticeship to a builder, carpenter, and cabinet-maker. Possessed of strong literary tastes, and fond of country life and sports, he wrote poems, and an account of a country excursion after the manner of Washington Irving. On April 16, 1821, William Howitt married Mary Botham, a young lady of kindred tastes (born at Uttoxeter, 12th March 1799), and they settled at Hanley, to conduct a chemist's business. After a few months they removed to Nottingham for twelve years of steady and successful literary industry and mental improvement. Their later places of abode were Esher, in Surrey, London, Heidelberg, and Rome. The record of their after-life is a record of the books they wrote, of pleasant travel for literary purposes, while they were on terms of easy intercourse with all their notable contemporaries. In 1852–54, at the height of the gold-fever, William Howitt was in Australia. The Howitts were instrumental in getting £1000 for Miss Meteyard's life of Wedgwood, and it was at William Howitt's suggestion that Mrs Gaskell wrote her first novel. They quitted the Society of Friends in 1847; William Howitt became a believer in spiritualism, and in May 1882 Mary Howitt joined the Catholic communion. After a long life of blameless literary industry William Howitt died at Rome, March 3, 1879. Mary Howitt, whose heart and mind 'ever flowed with love and interest for all her surroundings,' composed and wrote from her earliest years, and most people have seen or read some of her poems, ballads, novels, or juvenile tales, of which she wrote many. By means of translations she first made the works of F. Bremer and Hans Andersen known to the English public. She wrote for the annuals, for the *People's Journal*, *Howitt's Journal*, *Chambers's Journal*, &c. A pension was bestowed upon her in 1879 by Lord Beaconsfield. She died at Rome, January 30, 1888, and her remains were laid beside those of her husband in the cemetery of Monte Testaccio. One critic has justly said that W. Howitt and his wife are inseparably associated with all that is enchanting in rural England. In their poems, their novels, and the stories of their country rambles they made themselves the exponents of nature, blending the idealism of poetic fancies with pictures that have the realism of photographs. In politics William Howitt was an extreme Radical. Joint productions of William and Mary Howitt were the *Forest Minstrel* (1827), *Desolation of Eyam* (1827), *Book of the Seasons* (1831), *Literature and Romances of Northern Europe* (1852), *Stories of English Life* (1853), and *Ruined Abbeys of Great Britain*. William Howitt's chief works, besides contributions to newspapers and magazines, were *History of Priestcraft* (1833); *Pantika* (1835); *Rural Life in England* (1837); *Visits to Remarkable Places* (1838; second series, 1841); *Colonisation and Christianity* (1838); *Boy's Country Book* (1839); *Student Life of Germany* (1841); *Homes and Haunts of the Poets* (1847); *Land, Labour, and Gold* (1855); *Illustrated History of England* (6 vols. 1856–61); *History of the Supernatural* (1863); *Discovery in Australia, Tasmania, and New Zealand* (1865); *Mad War Plant, and other Poems* (1871). See *Mary Howitt, an Autobiography*, edited by her daughter, Margaret Howitt (2 vols. 1889).

Howitzers (Ger. *Haubitzen*) are guns which came into use early in the history of field artillery, as portable instruments for discharging shell into a hostile force. As for this purpose no great range was necessary, a small charge of powder sufficed; and the howitzer could be made, in proportion to its large bore, extremely light. For modern howitzers, see Cannon.

Howler, Howling Monkey, or Stentor (*Mycetes*), a genus of Central and South American monkeys, remarkable for the dilatation of the hyoid bone into a hollow drum, which communicates with the larynx, makes a conspicu-

ous external swelling of the throat, and gives prodigious power to the voice, enabling these animals to emit hideous sounds, which can be heard at least two miles away, and to which all their names refer. They live chiefly among the branches of trees, and take extraordinary leaps from one to another, taking hold by the tail like most of the American Platyrrhine monkeys, as readily as by the hands, and often swinging by it alone. They are gregarious, and unite their voices in concert, so as to produce a most deafening noise; this is what Humboldt and others say, but according to Wallace it is only one individual at a time which causes all the sound. The monkeys of this genus have a low intelligence, and their brain structure bears out this view. A howler was first brought alive to Europe and exhibited at the Zoological Gardens, London, in 1863. There are apparently not more than six species.

Howrah, or HAURA, a town of India, with growing manufactures, on the right or west bank of the Hooghly, directly opposite to Calcutta, of which it is practically a suburb. It is connected with Calcutta by a floating bridge (1874), and is the Bengal terminus of the East Indian Railway. Pop. (1872) 97,784; (1881) 105,628; (1891) 129,800.

Howson, JOHN SAUL, dean of Chester, was born in 1816, and in 1837 took a double first-class at Cambridge. Taking orders eight years later, in 1849 he became principal of the Liverpool College, and in 1867 dean of Chester. The complete restoration of the cathedral was in great measure due to his energy and devotion. He died 15th December 1885. With Conybeare he wrote the well-known *Life and Epistles of St Paul* (1852).

Howth, a peninsula on the east coast of Ireland, forming the north side of the Bay of Dublin, terminates in a lofty cliff, at the foot of which nestles the village of Howth, the chief fishing-station on that part of the coast.

Hoxton, a district of London, partly in Hackney, but mainly in Shoreditch; the Hoxton division being part of the parliamentary borough of Shoreditch.

Hoy (Scand. *Hoey*, 'high island'), one of the Orkneys, 1¼ mile SW. of Mainland or Pomona. It is 13¾ miles long, 3 furlongs to 6¼ miles broad, and 53 sq. m. in area. Unlike the rest of the group, Hoy rises abruptly from the sea, with stupendous cliffs that attain 1140 feet in Bracbrough or St John's Head, and 595 in Bervy Hill; inland are Cuilags Hill (1420 feet) and the Ward Hill (1564), commanding a splendid panoramic view. The rocks represent both the Upper and the Lower Old Red Sandstone. Near the south end is the fine natural harbour of Long Hope (5½ × 1⅔ miles). The 'Dwarfie Stone' is a sandstone block, 28 feet long, 14½ broad, 6½ high, with a chamber hollowed out of it; and the 'Old Man of Hoy' is an insulated pillar of rock, 450 feet high. Pop. (1841) 1486; (1891) 1320. See Tudor's *Orkneys* (1883).

Hoy, a small coasting vessel, differing little, if at all, from the sloop or smack, and often used for conveying goods from a large vessel to the shore.

Hoylake, a small watering-place of Cheshire, at the extremity of Wirral peninsula, 8 miles by rail W. of Birkenhead. It has a celebrated golf-links, opened in 1869. Pop. of district, 2519.

Hoyle, EDMOND, the creator of whist, was born in 1672, and is said to have been educated for the bar. Little is known about his life, except that he lived for some time in London, writing on games and giving lessons in whist, and died there on 29th August 1769. In 1742 he published his *Short Treatise on Whist*, containing the laws and some rules, for which he is said to have received £1000, and which in 1763 reached a 13th edition. See WHIST, and ten articles in *Notes and Queries* for 1889.

Hrabanus. See RABANUS MAURUS.

Hradschin. See PRAGUE.

Hualla'ga, a river of Peru, rises near the Cerro de Pasco, over 14,000 feet above the sea, flows north on the east side of the Central Cordillera, breaks through the range at the gorge of Chasuta, and enters the Marañon. Its total length is about 650 miles; it is navigable as far as Yurimaguas, above which are falls and rapids.

Huamanga. See AYACUCHO.

Huanaca, or GUANACO (*Lama huanacos*: see LLAMA), a species of the same genus with the llama, vicuña, and alpaca, of which some naturalists suppose it to be the wild original. It is found not only on the Andes, but throughout great part of Patagonia. It is of a reddish-brown colour, the ears and hind-legs gray. It generally lives in herds of ten to forty, and is very quick-sighted and wary; although such is the strength of its curiosity that hunters attract the herds within easy reach of their rifles by lying down on the ground and kicking their feet in the air. Like its congeners, the Huanaca is extremely sure-footed on rocky ground.

Huancaveli'ca, a department of Peru, lying entirely within the Cordilleras, with an area of 8710 sq. m. Pop. 104,155. The climate is cold and raw on the mountains, where sheep, cattle, and llamas are herded, and hot in the deep valleys, where sugar is grown. The chief riches are in the mines, especially of silver and quicksilver.—The capital, Huancavelica, 150 miles SE. of Lima, is a dreary mining town in the sierras; pop. 4000.

Huanchaca, seat of the chief silver mines in Bolivia (q.v.).

Huan'uco, a department of Peru, with an area of over 13,000 sq. m. Mining and agriculture are the chief industries. Pop. 78,856.—The capital, Huanuco, lies in a lovely valley on the Huallaga, amid plantations of coffee and sugar. It is a bishop's see. Pop. 5300.

Huber, FRANÇOIS, author of a book on the habits of bees, was born at Geneva, July 2, 1750, and died, 22d October 1830, at Pregny near his birthplace. At an early age he lost his eyesight, but with the assistance of his wife and an intelligent domestic he conducted a number of original and important observations on the habits of bees. His book first appeared as *Lettres à Ch. Bonnet* (1792); it was reprinted in 1796, and again in 1814, under the title of *Nouvelles Observations sur es Abeilles.* In his later years he derived important aid from his son, Jean Pierre (1777–1841), who wrote a valuable treatise on the *Habits of Ants* (1810).

Hubert, ST, Bishop of Liége, was son of Bertrand, Duke of Guienne, and was born in 656. He lived a luxurious and worldly life, first at the court of the Frankish king Theoderich, next under Pepin of Heristal, but after the death of his wife retired from the world into a monastery, on the advice of Bishop Lambert. Afterwards, when on a pilgrimage to Rome, he was made by Pope Sergius I. Bishop of Tongern, and in 708 succeeded his master, Lambert, in the see of Maestricht and Liége. He died in 727, and was afterwards canonised; his festival falls on November 3. He has been patron of orders of knighthood in Bavaria and Bohemia. See the books by Fétis (1846), Des Granges (1872), and Heggen (1875). In legend and in art, since the 15th century, St Hubert appears as a mighty hunter who was startled into repentance when hunting on Good Friday by the sudden appearance of a stag bearing between his horns a radiant crucifix.

At once he renounced hunting and all worldly pleasures, and became after his canonisation the patron saint of hunters. His aid is especially efficacious for persons bitten by mad dogs and those possessed with devils. See H. Gaidoz, *La Rage et St Hubert* (1887).

Hubertusburg, formerly a royal hunting-seat of Saxony, 25 miles E. by S. from Leipzig, built in 1721 by Prince Frederick Augustus, afterwards King Augustus III. of Poland. It was much injured during the Seven Years' War; and there on 15th February 1763 was signed the treaty by which that war was ended. Since 1840 the buildings have served as a prison, a hospital, an asylum for the insane, and a refuge for idiot children.

Hubli, a town of Dharwar in the presidency of Bombay, stands on a good road leading to Karwar on the Malabar coast, 102 miles to the south-west. It contains (1891) 52,595 inhabitants, and is one of the principal cotton-marts in that section of India.

Hübner, Rudolf Julius Benno, German painter, was born at Oels, in Silesia, 27th January 1806. He studied at Düsseldorf, to which school of painting he belongs. In 1841 he was appointed professor of Painting in the academy at Dresden, and was director of the picture-gallery from 1871 to 1882, in which year he died, 7th November, at Loschwitz, near Dresden. Among his pictures are 'Job and his Friends,' 'Charles V. in San Yuste,' 'Frederick the Great in Sansouci,' 'The Golden Age,' and 'The Dispute between Luther and Dr Eck.' He also designed glass paintings, including some for the crypt of Glasgow Cathedral.

Huc, Évariste Régis, French missionary and traveller, was born at Toulouse, August 1, 1813. Almost immediately after his ordination he joined in 1839 the missionary expedition of his order, the Lazarist Fathers, to China. In 1844 Huc, in company with Père Gabet and a single native convert, set out with the intention of penetrating to the unknown land of Tibet, beyond the terrible desert of Gobi. But it was not until January 1846 that they succeeded in reaching Lhassa, the capital of Tibet, and the residence of the Dalai Lama. And scarcely had they settled in that city and started a mission, when an order for their immediate expulsion from the country was obtained by the Chinese resident in Lhassa. They were conveyed back to Canton. Huc's health having completely broken down, he returned to France in 1852. His Asiatic experiences are recorded in *Souvenirs d'un Voyage dans la Tartarie, le Thibet, et la Chine pendant les Années 1844 46* (2 vols. Paris, 1850; Eng. trans. by W. Hazlitt, 1851–52), and *L'Empire Chinois* (2 vols. 1854; Eng. trans. 1855). He also wrote *Le Christianisme en Chine* (4 vols. 1857–58; Eng. trans. 1857–58). The strangeness of some of the incidents recorded in the book on Tibet provoked some degree of incredulity; but the testimony of later travellers in the same regions fully corroborates the truth of Huc's narrative. He died at Paris in March 1860.

Huckaback, a coarse kind of linen cloth, figured somewhat like damask, and usually employed for table-cloths and towelling.

Huckleberry. See Whortleberry.

Huddersfield, a 'clothing town' in the West Riding of Yorkshire, a municipal and county borough, 26 miles NE. of Manchester, 15 S. of Bradford, 17 SW. of Leeds, and 189 NNW. of London. Well built of stone and regular, it occupies a considerable extent of high ground, sloping down to the left bank of the Colne, which here receives the Holme; and it owes its rapid extension to its situation in a rich coal-district, to its abundant water-power, and to its transit facilities by rail and canal. Among the chief edifices are the circular cloth-hall (1768–80); the railway station (1848), with a marble statue of Peel (1875) before it; the classical town-hall (1880); the market-hall (1880); and the infirmary (1831–74). The Mechanics' Hall (1848) developed into the Technical School (1883). The first parish church of Huddersfield was built before 1110, rebuilt in Tudor times, and again (unhappily before the revival of architecture) in 1835. St John's (1853) was designed by Butterfield, and St Thomas' (1859) by Sir G. G. Scott. The Beaumont Park, 21 acres in area, was opened by the Duke of Albany in 1883, and there also is Greenhead Park of 26 acres. Huddersfield is the chief seat in the north of England of what is called the 'fancy trade,' and every description of plain woollen goods is also manufactured; whilst other industries are cotton and silk spinning, iron-founding, machine-making, &c. Roman remains have been found here; but Huddersfield has no history to speak of. In 1750 Bishop Pococke described it as 'a little town.' It was enfranchised by the Reform Act of 1832, and made a municipal borough in 1868, the boundary having been greatly extended the year before. Pop. (1861) 34,877; (1871) 74,358; (1881) 86,502; (1891) 95,422.

Hudson, a river in New York, and one of the most beautiful and important in America. It rises in the Adirondack Mountains, 4326 feet above the level of the sea, its head-streams the outlets of many mountain-lakes. At Glen's Falls it has a fall of 50 feet, and soon after, taking a southerly course, runs nearly in a straight line to its mouth, at New York city. It is tidal up to Troy, 151 miles from its mouth, and magnificent steamboats ply daily between New York and Albany. Below Newburg, 60 miles from New York, the river enters the highlands, which rise abruptly from the water to the height of 1600 feet. Here historical associations add to the interest of scenery of singular beauty and grandeur: here was the scene of Arnold's treason and of André's fate; and at West Point, the seat of the United States military academy, 8 miles below Newburg, are the ruins of Fort Putnam, built during the war of independence. Emerging from the highlands, the river widens into a broad expanse called Tappan Bay, which is 4½ miles wide and 13 long. Below, on the right bank, a steep wall of trap rock, called the Palisades, rises from the river's brink to a height of 300 to 510 feet, and extends for nearly 20 miles to the upper portion of the city of New York. The river from here is known as the North River, and is from 1 to 2 miles wide; and after passing between New York and Hoboken and Jersey City, it falls into New York Bay. Its whole length is about 350 miles, and its principal tributaries are the Sacondaga, Mohawk, and Walkill. The Hudson has valuable shad and sturgeon fisheries. The Hudson River Railway, connecting New York with Albany, runs along the east bank. The river, named from the English navigator who explored it in 1609, is connected by canals with Lakes Erie and Champlain, and with the Delaware River. In 1894 a suspension bridge connecting New York and Jersey City was sanctioned, and the plans approved in 1895. Robert Fulton's first successful experiment in steamboat navigation was made on this river in 1807. See 'Our River,' by John Burroughs, in *Scribner's Monthly* (August 1880); the *Panorama of the Hudson* (as far as Albany; New York, 1888); and Wallace Bruce, *The Hudson* (1895).

Hudson, capital of Columbia county, New York, stands on the left bank of the Hudson River, and on the Hudson River Railroad, 116 miles N. of New York city. It extends along a high ridge

ending in a bold promontory, at whose foot are the wharves; its former West Indian trade and its whale-fisheries have been abandoned, but it has still an active river-trade. Hudson has a fine court-house, a city hall, several foundries and blast-furnaces, and manufactures of fire-engines, paper, leather, flour, &c. Pop. 9970.

Hudson, GEORGE, the 'Railway King,' was born near York in March 1800. There he subsequently carried on business as a linen-draper. Inheriting a fortune of £30,000 in 1828, Hudson withdrew from business, and began to interest himself in local politics and in railway speculation. He became the ruling spirit of the York and North Midland Railway Company; and his ventures and schemes for amalgamating various railway companies were attended with extraordinary success. Hudson was elevated to the dictatorship of railway speculation. Everything he touched turned to gold. He bought large estates, was three times elected lord mayor of York, and was sent to parliament by the electors of Sunderland (1845). But the railway mania of 1847–48 plunged him into ruin. He was accused of having 'cooked' the accounts of companies with which he was connected, and of having paid dividends out of capital. Legal proceedings were instituted against him, and his suddenly-acquired gains were almost entirely swept away. The constituency of Sunderland, however, continued to elect him as their representative until March 1859. He afterwards lived in comparatively narrow circumstances, and died in London, December 14, 1871.

Hudson, HENRY, a distinguished navigator, of whom we know nothing before April 1607, when we find him starting, in a small vessel with ten sailors, on his first unfortunate voyage for the discovery of a north-east passage. In his second voyage in 1608 he reached Nova Zembla. He undertook a third voyage in 1609 from Amsterdam, at the expense of the Dutch East India Company. Giving up all hope of finding a north-east passage, he sailed for Davis Strait, then steered southwards in search of a passage, discovered the mouth of the river which now bears his name, and sailed up its waters for 150 miles. He sailed upon his last voyage in April 1610, in the *Discoverie* of 70 tons, and reached Greenland in June. Steering westward, he discovered the strait now known as Hudson Strait, and passed through it, and entered the great bay which has received the name of Hudson Bay. Although very insufficiently supplied with provisions, he resolved to winter in these desolate regions, in order to prosecute his discoveries further in the following spring. The food fell short, and the men, dissatisfied with Hudson's determination to continue the voyage, mutinied, and cast him adrift in a shallop, with eight others, on Midsummer Day 1611. The real ringleaders perished miserably in a scuffle with savages, and the survivors, after great suffering, reached England. See George Asher's *Henry Hudson, the Navigator* (Hakluyt Society, 1860).

Hudson Bay, a gulf, or rather inland sea, in the north-east of North America, is completely landlocked except on the north, where Southampton Island and Fox Channel lie between it and the Arctic Ocean, and where Hudson Strait, running 500 miles south-east, connects it with the Atlantic. Including its south-eastern extension, James's Bay (q.v.), it measures about 1000 miles in length and 600 in average width, and has an area of some 500,000 sq. m. The eastern shore, called the East Main, is for the most part rocky, and is fenced with several small islands; the western shore, the West Main, is generally flat. This sea, the great drainage reservoir of the Canadian North-west Territories, receives the precipitation from over an area of nearly 3,000,000 sq. m. Of the numerous rivers which bring down this water only two need be mentioned—the Churchill, whose deep and narrow mouth forms the best harbour on the shores of Hudson Bay, and the Nelson, of whose total course of 400 miles only 70 or 80 are navigable. Hitherto the only business that has been to any extent developed in this region has been the fur trade of the Hudson Bay Company (q.v.), though fish-oil has also been exported. Of late years, however, a movement has been on foot for opening up a direct communication from England with Manitoba and the North-west of Canada by way of Hudson Bay and Strait. The scheme provides for a railway from Winnipeg to Fort Nelson on the bay, a distance of 650 miles, of which 40 miles were constructed by the end of 1890. The chief objection to the project is that, although the bay is quite easy to navigate, and is only covered with ice in winter to a distance of about 10 miles from the shore, yet the passage of Arctic drift-ice through Fox Channel and Hudson Strait in early summer renders the successful navigation of the latter waterway somewhat uncertain. The strait can, however, be traversed by vessels on an average for about three months annually. This route would effect a saving of 775 miles as compared with the route by way of Montreal, and of 1130 as compared with that by New York.

See *Captain W. Coats's Geography of Hudson's Bay, 1727–51*, edited by J. Barrow for the Hakluyt Society (1852); Dr Robert Bell in *Proc. Roy. Geog. Soc.* (1881); W. Shelford in *National Review* (1886); and C. R. Markham in *Proc. Roy. Geog. Soc.* (1888).

Hudson Bay Company, a corporation formed in 1670 by Prince Rupert and seventeen noblemen and gentlemen for importing into Great Britain furs and skins obtained by barter from the Indians of North America. The company was invested with the absolute proprietorship and the exclusive right of traffic over an undefined territory, which, under the name of Rupert's Land, comprised all the regions discovered, or to be discovered, within the entrance of Hudson Strait. This was taken as meaning all lands that drained into Hudson Bay or Hudson Strait. For more than a century, however, the grantees confined themselves to the coast districts. Down to 1713 they had also to contend against the hostile acts of the French of Canada, who destroyed their forts, ruined their goods, and captured their ships. But after Canada passed from the French to the British in 1763 adventurers from the great lakes began to penetrate, in quest of peltry, far up the Saskatchewan towards the Rocky Mountains. And their enterprises, coming to be prosecuted with more systematic energy, led in 1783 to the formation of the North-west Fur Company of Montreal. After a period of stubborn competition, the Hudson Bay Company coalesced with its formidable opponent in 1821. The sphere of their labours was now practically coincident with all British North America, between the Pacific and Atlantic, and the Arctic Ocean and the United States. In 1838 the Hudson Bay Company again acquired the sole right of trading for itself for a period of twenty-one years; on the expiry of this concession the fur trade in British North America was thrown open to the world. Finally, in 1869, the company made a formal cession to the British government of whatever territorial claims remained, receiving an indemnity of £300,000 from the Dominion of Canada, to which the whole territories were forthwith annexed. It was, however, stipulated that the company should retain all its forts, with 50,000 acres and one-twentieth of all the land lying within the 'fertile belt' from the Red River to the Rocky Mountains. Besides still

carrying on the business of collecting furs, the company now derives a large income from the sale of these conceded lands.

See Butler's *Great Lone Land* (1872), H. M. Robinson's *Great Fur Land* (New York, 1879), the History by Professor George Bryce (1900), and Beckles Willson's *The Great Company* (1900).

Hué, the capital of Annam, 10 miles from the mouth of the Hue River, or Tnongtien. In 1801 it was strongly fortified by French officers. The heart of the city is occupied by the palace; much of the rest of it is composed of mud huts. Since before Annam became a French protectorate, there has been a French resident at Hue; and since the treaty of Hué in 1884 there is a French garrison in Thuanan, the port of Hue. There is little industry in Hue, which has a population of 30,000 (with suburbs, 50,000), including a number of Chinese. See ANNAM.

Hue and Cry, a phrase derived from the old process of pursuit with horn and voice, used in old English law to describe the pursuit of felons. Whoever arrested the person pursued was protected; and it was the duty of all persons to join in a hue and cry. The *Hue and Cry*, a police gazette for advertising criminals, was established in 1710.

Hueffer, FRANCIS, musical critic and Provençal scholar, was born at Münster, in Westphalia, in 1845, studied at Berlin, Leipzig, and Paris, and settled in London in 1869. He soon became an authority on music, was musical critic of the *Times*, and was recognised as the champion in Britain of Wagner and Wagnerian music. In 1869 he edited the Provençal poet Guillem de Cabestanh, and in 1878 published *The Troubadours: a History of Provencal Life and Literature in the Middle Ages*. Two works on Wagner were from his pen—one in 1874, the other in the 'Great Musicians' series, in 1881. He died January 19, 1889.

Huelva, a thriving town of Spain, situated near the confluence of the Odiel and the Tinto, 68 miles by rail WSW. of Seville. Fishing and the plaiting of esparto grass are the chief industries. Huelva is the port for the important Rio Tinto copper-mines, in British hands, and a shipping place for wine. An iron pier was erected in 1889–90. Some 500,000 tons of copper ore, 450,000 of iron ore, besides manganese, quicksilver, wine, &c. are annually exported; the imports, especially coal and coke, iron and steel, amount to 150,000 tons. Pop. 19,000. The *province* of Huelva has an area of 3913 sq. m., and a pop. of 250,000.

Huerta, VICENTE GARCIA DE LA, a Spanish poet and critic, was born in 1730 at Zafra, in Estremadura, but spent the greater part of his life in Madrid, where he was head of the Royal Library, and where he died on 12th March 1787. His tragedy of *Raquel* (1778), founded upon the story of the love of King Alfonso VIII. for the fair Jewess Rachel, was received with great enthusiasm, and is still esteemed one of the best of modern Spanish tragedies. Huerta was a zealous but not always consistent opponent of the prevailing Gallicism of his own day. As a lyric and dramatic poet he shows great command of language and versification. His poems were published in two volumes in 1778–79, and again in *Biblioteca de Autores Españoles* (vol. lxi.). Huerta edited the *Teatro Español* (17 vols. 1785–86), a collection of the best works of the older Spanish dramatists.

Huesca, a very old and picturesque town of Spain, on the Isuela, 55 miles by a branch line NE. of Saragossa. Among its chief buildings are the cathedral (1400–1515), a beautiful Gothic edifice; the Romanesque church of San Pedro (1150–1241); the university, founded in 1354 by Pedro IV.; and a former palace of the kings of Aragon. The *Osca* of the Romans, where Sertorius was murdered in 72 B.C., Huesca afterwards became famous as a seat of learning. Tanning and manufactures of linens are here carried on to some extent. Pop. 13,043. The *province* of Huesca has an area of 5848 sq. m., and a pop. (1887) of 254,958.

Huescar, a town of Spain, 75 miles NE. of Granada. Pop. 7760.

Huet, PIERRE DANIEL, French scholar and polymath, was born at Caen, February 8, 1630. He was educated in the Jesuit school of Caen, and became a zealous pupil of Descartes and of Bochart. The latter he accompanied on a visit to Stockholm in 1652, when he discovered and transcribed the MS. of Origen which was the basis of his celebrated edition of that father fifteen years later. On his return home he gave himself up entirely to study. In 1661 he published his essay *De Interpretatione*. In 1670 he was appointed with Bossuet tutor of the dauphin, and in the same year wrote his *Essai sur l'Origine des Romains*. He took an active part also in preparing the Delphin edition of the classics. Having in 1676 taken holy orders, he was successively abbot of Aunay (1678), Bishop of Soissons (1685) and Avranches (1692), and abbot of Fontenay (1699). In 1679 appeared one of his most important books, *Demonstratio Evangelica*. In 1701 he withdrew to the Jesuits' house in Paris, where he died, 26th January 1721. During his episcopal career Huet published a couple of books on the Cartesian philosophy, another on reason and faith, and another on the site of the earthly paradise. To his latest years belong *Histoire du Commerce et de la Navigation des Anciens* (1716), and his autobiographical memoirs (1718). His works were published in a collected form in 1712, and a volume of *Huetiana* appeared in 1722. In this latter year Huet's *Traité de la Faiblesse de l'Esprit Humaine*, which excited much controversy, first saw the light. See his Latin autobiography (1713), the French Life by Bartholomess (1850), and an article in the *Quarterly*, 1855.

Hufeland, CHRISTOPH WILHELM, German physician, was born on 12th August 1762, at Langensalza, in Thuringia. After studying at Jena and Göttingen, he was appointed physician to the court of Weimar, where his father and his grandfather had previously filled the same office. In 1793 he was appointed professor of Medicine at Jena, and in 1798 went to Berlin to preside over the medical college there and the Charité Hospital. On the foundation of the university of Berlin in 1809 he became one of its professors. He died 25th August 1836. He had a very high reputation for skill as a physician, was greatly esteemed for his intellectual abilities and his fine character, and founded a number of benevolent societies and institutions. Of his published works the most notable were the famous *Makrobiotik*, or the art of prolonging life (1796; 8th ed. 1889), which was translated into almost all the languages of Europe; a work on the physical education of the young (1799; 12th ed. 1875); and *Enchiridion Medicum* (1836; 10th ed. 1857).

Hug, JOHANN LEONHARD, Catholic theologian, was born at Constance, June 1, 1765, entered into priest's orders in 1789, was appointed a professor of Theology at Freiburg in 1791, and died there, 11th March 1846. The most important fruit of his biblical researches was his *Introduction to the New Testament* (2 vols. 1808), which was translated into most of the European languages (Eng. by D. G. Wait, 1827).

Huggins, SIR WILLIAM, K.C.B. (1897), astronomer, was born in London on 7th February 1824.

Whilst still a youth his mind was attracted to the study of chemistry, magnetism, and allied branches of physical science. In 1852 he was elected a member of the Microscopical Society, and for some years laboured at the study of physiology, animal and vegetable, with the microscope. But having in 1855 built for his own private use an observatory at Upper Tulse Hill, near London, he began what proved to be the principal work of his lifetime —the study of the physical constitution of stars, planets, comets, and nebulæ. By researches on the sun's spectra and the spectra of certain comets, he ascertained that the luminous properties of the former are not the same as the luminous properties of the latter. Since 1875 he has been engaged photographing the ultra-violet parts of the spectra of the stars. He has also determined the amount of heat that reaches the earth from some of the fixed stars. Mr Huggins was elected a Fellow of the Royal Society in 1865. He was twice awarded the medal of the same society and twice the gold medal of the Royal Astronomical Society. In 1874 he became corresponding member of the Paris Academy of Sciences, and three years later corresponding member of the Royal Society of Göttingen. From 1876 to 1878 he was president of the Royal Astronomical Society.

Hugh, St, of Avalon, Bishop of Lincoln, was born of noble family at Avalon in Burgundy about 1135. On his mother's death his father entered a priory of regular canons at Villarbenoit, carrying with him the boy, then but eight years old. At nineteen he was ordained deacon, and was already remarkable for his holiness of life and ascetic austerity. Ere long he was attracted by the severer discipline of the Grande Chartreuse, and thither he repaired, although he had taken an oath to his superior not to do so. Here he remained ten years, received his priest's orders, and was for his practical ability appointed bursar to the monastery. His fame came to the ears of Henry II., who prevailed upon him to accept the government of the struggling Carthusian monastery at Witham in Somersetshire, and summoned him hence in May 1186 to fill the bishopric of Lincoln. For fourteen years he governed his diocese with great wisdom and vigour, retiring every year a short time to Witham for his soul's health. His unworldly holiness gave him great influence, not only over Henry II., but also his successors Richard and John. He did not leave off his frank outspokenness of speech and his quick wit even in the presence of the king. Withal his charity was so remarkable that even the Jews of Lincoln are said to have wept at his funeral. All his life he had been notable for his love of birds, and at his residence at Stow, near Lincoln, he had a pet swan whose affection for its master appeared to beholders to be more than natural. The swan usually appears in representations of the saint. Soon after his accession to the episcopal throne he had begun with vigour the rebuilding of his cathedral, and he lived to see the completion of the choir and eastern transepts. But indeed, with the exception of the presbytery, the entire church, as it now dominates Lincoln, was conceived in the mind of Hugh's architect, and gradually perfected under his successors. Hugh visited his native country in 1200, and on his return journey was seized with illness, and died at London 16th November 1200. He was canonised in 1220, and for long miracles were wrought at his tomb, and his cult was almost as popular as that of St Thomas in the south.

Both the *Metrical Life of St Hugh of Avalon* (1860) and the *Magna Vita S. Hugonis* (1864), the latter most likely written by his domestic chaplain, Adam, abbot of Evesham, were edited by the Rev. J. F. Dimock. A Life by Giraldus is printed in vol. vii. (1877) of the works of Giraldus Cambrensis. See also Canon Perry's *Life of St Hugh of Avalon* (1879).

Hugh of Lincoln, a boy supposed to have been murdered by the Jews of Lincoln, as told both in English traditional ballads and early chronicles. Professor Child (No. 155) gives no fewer than eighteen versions of ballads on this theme, which agree marvellously even in detail. A group of boys playing at foot or at hand ball are joined by the young Hugh or Sir Hugh, who drives the ball through a Jew's window, is enticed into the house by the Jew's daughter, cruelly murdered and flung into a well, from which he speaks miraculously, whereby the murder is discovered. The story of Hugh of Lincoln is told in the *Annals of Waverley*, under the year 1255, by a contemporary writer. Here the boy is tortured by the Jews, and finally crucified in contempt of Christ. His body is discovered by miraculous means, and eighteen Jews are hanged for their share in the crime. Additional circumstances are found in Matthew Paris. The story occurs simultaneously in several Anglo-French ballads; and Chaucer's *Prioresses Tale* is an artistic elaboration of the theme.

We find more or less circumstantial versions of the same story not only at Lincoln, but at Norwich, Gloucester, London, and Northampton; at Blois, at Saragossa, and Valladolid; at Frisingen and Zurich; at Prague and Cracow, Pavia and Venice, and very frequently among the German peoples, as at Vienna, Erfurt, Magdeburg, Mainz, Munich, Breslau, and Ratisbon. Besides the desire to deride the Passion, an additional motive was invented, that the Jews sought to obtain blood for use in the Paschal rites—a charge ridiculously at variance both with Jewish precept and practice. This singular notion has survived persistently for over 600 years, and has formed a pretext for cruel and shameful wrong down to our own day. It is still a firmly-held popular notion in Russia, Hungary, at Smyrna and Alexandria; indeed it was only so late as August 1883 that fifteen Jews were acquitted after over a year's imprisonment for the alleged kidnapping of a young girl at Tisza-Eszlár, and that the good Christians of Budapest plundered the Jewish shops in their disappointment.

See the Chaucer Society's *Originals and Analogues of Chaucer's Canterbury Tales* for 1875–76; Child's *English and Scottish Popular Ballads* (1888); and *The Life and Miracles of St William of Norwich*, edited by Jessopp and James (1897).

Hugh Capet. See Capetian Dynasty.

Hughenden (locally *Hitchendon*), a parish of Buckinghamshire, among the Chiltern Hills, 2 miles N. of High Wycombe. Hughenden Manor, a large brick three-story mansion, mostly modern, was purchased before 1847 by Benjamin Disraeli, Earl of Beaconsfield. It is rich in interesting portraits; and in its terraced gardens are trees planted by Queen Victoria in 1877 and the Prince of Wales in 1880. The ancient parish church, much restored in 1874, contains a monument to the earl, erected by the Queen; and in its vault he lies buried by the side of Lady Beaconsfield.

Hughes, Thomas, author of *Tom Brown's School-days*, second son of John Hughes, Esq., of Donnington Priory, near Newbury, in Berkshire, was born at Uffington, Berks, October 23, 1823. He was educated at Rugby under the celebrated Dr Arnold; entered Oriel College, Oxford, in 1841, and took his degree of B.A. in 1845; was called to the bar at Lincoln's Inn in 1848, and became a member of the Chancery Bar. In 1856 he gave to the world *Tom Brown's School-days*, a vivid and truthful picture of life at Rugby, evidently written from the author's own boyish impressions. It is the highest praise to say that it admirably supple-

ments Stanley's life as a picture of the greatest of modern teachers. It was followed in 1858 by *The Scouring of the White Horse*; in 1861 by *Tom Brown at Oxford*, in which the mental history of his hero is continued, with sketches of college life and incidents; and in 1869 by *Alfred the Great*. Hughes pursued meanwhile the practice of the law, became Q.C. in 1869, and a County Court judge in 1882. He associated early with Maurice and Kingsley in their work of social and sanitary reform among the London poor, and while he had gained the confidence and good-will of the working-classes by his endeavours to promote a better understanding between masters and men, and by teaching the latter the value of co-operation, he has never failed courageously to rebuke the narrow prejudices and mischievous views held by certain members of trades-unions. At the general election for Lambeth in 1865 he was placed at the head of the poll. He was returned for Frome in 1868, which he continued to represent till 1874, and always took a prominent part in debates relating to trades-unions and the like. In 1880 he assisted in founding a settlement in the United States, described in *Rugby, Tennessee* (1881). He also wrote *Memoirs of a Brother* (1873), Lives of Daniel Macmillan (1882) and Bishop Fraser (1887), *Vacation Rambles* (1895), and the article MAURICE in this work. He died 22d March 1896.

Húglí. See HOOGHLY.

Hugo, VICTOR-MARIE (1802–85), was the son of a Lorrainer and a Breton, and was born at Besançon. His father, General Hugo, was on active service, so that his earlier years were mostly spent in the track of the emperor's armies. He was educated partly in Paris at the Feuillantines (1809–11, 1813–15), partly in Madrid (1812), and partly at the École Polytechnique, where he read mathematics and practised poetry. At fourteen he produced a tragedy; at fifteen he went near to winning a prize at an Académie competition; and at twenty, when he published his first set of *Odes et Ballades* (1822), he had thrice been victor at the Floral Games of Toulouse. The next year, being by this time a married man and the *enfant sublime* of M. de Chateaubriand, he published his *Hans d'Islande* (1823), that wild and whirling romance of an impossible Iceland; and followed it up with *Bug-Jargal* (1824), a second set of *Odes et Ballades* (1826), and the famous *Cromwell* (1827), thanks to which last—a tragedy even then impossible to act and now almost as difficult to read—he became the most conspicuous figure in æsthetic France. For Romanticism—that protest in action against the effete and hidebound conventions of the age of Louis XIV.—was now by way of being an accomplished fact; and the preface to *Cromwell* was greeted with an enthusiasm of approval on the one hand and of detestation on the other in these days not easy to understand. In its way, indeed, it is a document of singular importance in literary history. It is largely compacted of paradox and antithesis no doubt; and no doubt its premises are mostly dubious and its conclusions not more than fantastic. But it asserted the artist's right to be as Shakespearian—that is, as lawless—as he pleased, and it was so completely a declaration of independence, and a decree of emancipation, that, whatever happens, the literature of France can never wholly recover from its effect.

The time indeed was big with revolution and with change, and Hugo's manifesto was accepted by the Romanticists with the solemnity of absolute conviction, so that he instantly took his place by right of genius and authority at the head of the literary host. He was fully equal to the charge of course: for while he was far and away the greatest artist in words that modern France has seen, he was also very careful and curious in the work of 'engineering a reputation,' and contrived to take himself and his function so seriously that to his followers he was not much below divinity itself. It is said that he made himself a forehead: and it is certain that while M. Rodin's magnificent bust of him is far less suggestive of Apollo than of Hercules, the Hugo brow—enormous, radiant, 'prone with excess of mind'—appears and reappears in contemporary caricature with all the persistency and more than the effect of Gillray's view of the 'Bottomless Pitt.' It is certain, too, that the first sketch of his life and work that got into print was written in his own house, and was the work of his own wife; and as Mme. Hugo never wrote again, it is legitimate to argue that the hero may very possibly have lent a hand to the epic. But he never ceased from achievement; and his achievement was inevitably that of a great artist in speech. In 1828 he published his *Orientales*, wherein he revealed himself for such a master of rhythms, such an inventor in style, such an adept in the mystery of the use of words as France had never seen. The year 1830 was the great year of *Hernani*—the first in fact and the second in time of those 'five-act lyrics' of which Hugo's drama is composed. In so far as it relates to drama—material, structure, amount, movement, the presentation of emotion in action—the question had been settled now and for all time by Dumas the year before; but Dumas was not a writer in the sense that Hugo was, and the battle of style was still to fight, and the battlefield was the Théâtre-Français, and the *casus belli* was *Hernani*. It is so brilliantly written, the movement of the verse is so victorious and the diction is so gorgeous, that even now it takes one time and patience and a certain familiarity to see that, while constructed in the formula of *Henri Trois et sa Cour*, it is no more a play than *Samson Agonistes*. In those days men had neither time nor patience, while as for familiarity! . . . It was enough that to one side the verse was incomparable, and that to another it was the Accursed Thing. As Hugo took care to pack as much of the house as he could get made over to him with Romantics, and as on the other part the Classicists were to the full as eager for the quarrel, the question of what is and what is not style was argued for many nights on end with a vehemence—sometimes attaining to the inspiration of assault and battery—which has made 1830, as the year of *Hernani*, a sacred date—as who should say a species of Hegira in the annals of Romanticism.

In 1831 Hugo published *Notre Dame de Paris*, a pretentious but picturesque and moving historical romance in which he enters into competition with Sir Walter and comes badly off, and *Les Feuilles d'Automne*, a sheaf of lyric and contemplative verse in which is included some of his best poetry; and brought out his best play, *Marion Delorme*, at the Théâtre-Français. In 1832 he produced *Le Roi s'amuse*, which was interdicted after the first night, and of which the best that can be said is that it is superbly written and that it has gone the round of the world as *Rigoletto*. The next year was that of *Lucrèce Borgia* and *Marie Tudor*, the first a good and stirring melodrama, the second a farrago of unveracities of all kinds—moral, historical, dramatic, and the rest; in 1834 came *Claude Gueux*, which is pure humanitarian sentimentalism, and the *Littérature et Philosophie Mêlées*, a collection of juvenilia in prose, all carefully dated and all as carefully rewritten or revised. Followed in 1835 *Angelo*, a third melo-

drama in prose, and the admirable lyrism of *Les Chants du Crépuscule;* in 1836 *La Esmeralda* (an opera for Mdlle. Bertin); in 1837, *Les Voix Intérieures*, in which, as in *Les Feuilles d'Automne*, the poet's genius of diction is held by some to have found its noblest expression; in 1838, *Ruy Blas*, after *Hernani* the most famous of his stage rhapsodies; and in 1840, *Les Rayons et les Ombres*, yet another collection of brilliant and sonorous verse; after which the prodigious affluence of creativeness to which all those were due appears to have been momentarily exhausted. Certain it is that Hugo published no more until 1843, when he again failed at the Français with that ponderous trilogy of *Les Burgraves*, surcharged with as it were an Æschylean sentimentalism. His next essay in pure art was not put forth till 1856, the dozen or fifteen years between being very largely given over to the pursuit of politics and the practice of oratory, journalism, and pamphleteering in prose and verse.

Putting it roughly, Hugo was until 1830 a Royalist, and worshipped Napoleon; and between 1830 and 1848 he was a Napoleonist with a turn for humanitarianism, but more or less resolute in the cause of order and law. In this latter capacity it was that he sat for the city of Paris in the Assemblée Constituante. There he voted now with the Right and now with the Left, so that, when on his election to the Assemblée Législative he threw in his lot with the democratic republicans, the reproach of apostasy was by no means unfounded. It is not clear that he would have been finally content with any change in the condition of things at this time—always excepting such a turn of the wheel as would have brought himself to the top and kept him there as a kind of emperor by the grace of genius and the democracy. But it is plain that he was bitterly dissatisfied with things as they were, even as it is plain that he could neither endure the eminence of Montalembert nor consider with patience and dignity the fact of the popularity of the prince-president. In 1852, after the *coup d'état*, he withdrew to Jersey, whence he issued his *Napoléon le Petit*, perhaps the most mannered and the least literary of all his works, and in 1853 *Les Châtiments*, which is certainly the greatest achievement in the fusion of pure poetry with political and personal satire in all literature. Three years after appeared *Les Contemplations*, a gathering of poems elegiacal, reflective, and lyrical, remarkable for beauty of expression and comparative simplicity of style; and three years after that the wonderful and often bewildering *Légende des Siècles* (1859). Still another silence of three years was broken by the publication (in ten languages) of *Les Misérables* (1862), a panoramic romance of modern life, mannered beyond measure in style and abounding in absurdities and *longueurs*, but including also not a little of Hugo's sincerest and most touching invention and achievement; and this in its turn was followed by the extraordinary rhapsody called *William Shakespeare* (1864), and by *Les Chansons des Rues et des Bois* (1865), a book of verses which is at the same time a little gallery of achievements in style; by *Les Travailleurs de la Mer*, an idyll of passion, adventure, and self-sacrifice; by *L'Homme qui Rit*, a piece of fiction whose purpose and tenor are intended to be historical, and whose effect is sometimes to overwhelm the reader, often to weary him, and still more often to amuse. Returning to Paris after the Fourth of September, Hugo at once distinguished himself by summoning the Germans to withdraw from France and proclaim the German Republic. Some five or six months after he was chosen to represent the Seine, but soon resigned his seat on the ground that one of his speeches was interrupted by the Right. He stayed on through the rule of the Commune, and defended the Vendôme Column while he could; and then, departing for Brussels, he protested publicly against the action of the Belgian government in respect of the beaten Communists, the effects of which proceeding were that the populace rose against him, and that he was expelled the kingdom. Again he stood for Paris, but was beaten by a majority of 27,000 on a register of 231,000. In 1872 he published *L'Année Terrible*, a series of pictures of the war, diatribes against Germany, and eulogies of France, which are often eloquent and are sometimes poetry; in 1874 his last romance in prose, the much-debated *Quatre-Vingt-Treize;* in 1875-76 a complete collection of his speeches and addresses. In 1876 he was made a senator, and published the second part of the *Légende;* 1877 was the year of the *Histoire d'un Crime*, which has been fairly enough described as 'the apotheosis of the Special Correspondent,' and of *L'Art d'être Grand-père*, wherein, with much charming verse, are good store of conceits and no small amount of what some one has called 'the pedantry of sentimentalism;' 1878 and 1879 enriched us with *Le Pape*—a piece humanitarian, anti-clerical, and above all theatrical, which they may praise who can—and *La Pitié Suprême*, the effect of which is much the same, and which—like *L'Âne* (1880), and a great deal of *Les Quatre Vents de l'Esprit* (1881), and *Torquemada* (1882)—is merely Hugo in decay. His mastery of words remains invariable, his accomplishment is always superb; but all too frequently he produces antithesis under the delusion that he is expressing ideas, he parades all manner of affectations with the air of one reviewing a Tenth Legion or Old Guard (so to speak) of the sentiments, he continually mistakes preposterousness for grandeur; he falls a prey to any of the eternal unveracities he may chance to encounter; his 'philosophy' is a mere effect of appetite, and as always his depressing lack of humour is 'not merely zero, but even a frightful *minus* quantity,' so that he abides in error with a seriousness ridiculous indeed. But genius is always genius, and temperament never ceases from being temperament; and the final impression is one of unsurpassed accomplishment and abounding mental and emotional activity. So that Hugo died the foremost man of letters of his time, and they were few indeed who grudged him the public funeral with which he was dignified, and in which the pauper's hearse that bore him tombwards—(the invention was wholly his own)—was followed by the best and the worst of living France.

Hugo's work is vitiated as an expression of life by the presence of an abounding insincerity in combination with a quality of self-sufficiency so inordinate as scarce to be distinguished now and then from an immense stupidity. In truth he does but seem to create: his personages—Cimourdain, Josiane, Didier, Ursus, Ruy Gomez de Silva, Claude Frollo, Lantenac, Lucrèce Borgia, Javert, and Myriel, the very *pleurre* of *Les Travailleurs de la Mer*, are all expressions not of humanity but of Victor Hugo. You would believe in them—and in him—if you could; but you cannot, for he takes care to make belief impossible. His plays are sometimes well made, are always heavily decorated, are all magnificently written, and have all had their chance of immortality. But their author is Victor Hugo, and the situations are abnormal, the personages peculiar, the interests remote from experience, and such motive as is developed is too individual and strange to be felt beyond the footlights. Much the same is true of his prose romance; but while the level of style is nothing like so high as in the plays, it has merits—of invention, pathos and

terror, presentation -absent from these, and which made him one of the most popular writers of his epoch. That said, it may be added that to talk of Hugo as either a dramatist or a master of romantic fiction is to beg the question of Hugo's greatness. His prose, as prose, has never the easy, voluptuous, natural eloquence of George Sand's, nor the mordant felicity of Mérimée's, nor the spontaneity and vivacity of Dumas's, nor the terrible yet irresistible persuasiveness of the opening chapters of Musset's *Confession d'un Enfant du Siècle*. His dramas are only so many lyrical expressions of Hugolatry, the work of the arch-Hugolater. His best and truest title to immortality is his poetry. In truth, the range and the capacity of his genius in rhythm and rhyme are unparalleled in the literature of France. It was for Musset to utter the truest note, and to make the invention speak the very language of the heart; it has been for Leconte de Lisle, for Baudelaire, for Gautier to produce impeccable work each after his kind; but assuredly it was for Hugo to accomplish the most gorgeous and the most heroic achievement in the divine art of song. His verse, with its infinite capacity of violence and calm, sunshine and thunder, apocalyptic fury and grace ineffable, has something of the effect of the multitudinous seas as he saw and described them from his eyrie in midchannel. The effect of his alexandrines, with their wealth of colour and light and energy, may fairly be paralleled with that of Shakespeare's iambics; while in their purity of form, the sweetness and distinction of their cadences, their richness of rhyme, their magical felicity of expression, his lyrical measures put the Pleiad and all its works to shame. There can be no possible doubt that in many of the relations of life Hugo was a *poseur* of the first magnitude—that from the first he humbugged his contemporaries with a pertinacity and a success that are only equalled by his faculty of taking himself seriously. But there can be as little that while essentially un-French—a combination, indeed, of Teuton and Celt, and moreover absolutely lacking in sanity—he was a lyrist of the first order, a master of words and cadences, an artist in rhythms and rhymes.

See *Victor Hugo raconté par un Témoin de sa Vie* (1863) by his wife, who died at Brussels in 1868; works on him by Rivel (1878), Paul de Saint Victor (1885), Barbou (1881), Asseline (1885), Biré (three mainly hostile books, 1883-93), Dupuy (two books, 1887-90), Mabilleau (1893), Boudon (4th ed. 1893), Renouvier (1893); Swinburne, *A Study of Victor Hugo* (1886), and English works by Barnett Smith (1885), and J. P. Nichol (1892); and criticisms by Gautier, Banville, Baudelaire, and Sainte Beuve.—His son Charles (1826-71), publicist and novelist, was the father of the 'George' and 'Jeanne' of *L'Art de devenir Grandpère*; François (1828-73) trans. Shakespeare.

Huguenots (from the Genevese nickname *eiguenot*, Ger. *eidgenosse*), the name formerly given in France to the adherents of the Reformation, which movement commenced almost simultaneously in France and Germany. One of the most eminent names in the early history of French Protestantism is that of Farel (q.v.), and one of the first supporters of its cause was Margaret of Valois, queen of Navarre, the sister of Francis I. Subsequently, in the time of Calvin, many of the nobles and middle classes embraced the reformed religion. Francis I., however, opposed it with great severity, and caused many to be burned as heretics. The alliance of Henry II. with the German Protestants gave at first an impulse to the cause of the Reformation, but the aspect of things was again changed when the family of Guise obtained ascendency at court. Under Francis II. a chamber (*chambre ardente*) was established in each parliament for the punishment of Protestants; and executions, confiscations, and banishments were common in all parts of the kingdom. The Protestants took up arms against the government, choosing Louis I., Prince of Bourbon-Condé, for their leader. On February 1, 1560, in a meeting at Nantes, they resolved to petition the king for freedom of religion and for the removal of the Guises; and in the event of his refusal, to seize the king's person, and proclaim Condé governor-general of the kingdom. But the court, being apprised of the conspiracy, fled from Blois to Amboise, and the Duke of Guise was appointed governor-general. Some bands of Protestants, approaching Amboise with weapons in their hands, were easily defeated and taken; 1200 died by the hand of the executioner. The Edict of Romorantin, in May 1560, took the prosecution of heretics out of the hands of the parliament, and gave it into those of the bishops. Whilst the Guises plotted the death of the Protestant leaders Charles IX. ascended the throne, a prince not yet of age; and the queen-mother, Catharine de' Medici (q.v.), having removed the Guises from the helm of the state, was compelled to seek the support of the Protestants against them and their party. In July 1561 appeared an edict which freed the Huguenots from the penalty of death. For the complete termination of strife the court opened a religious conference at Poissy. The chief disputants were the Cardinal of Lorraine on the one side, and Theodore Beza (q.v.) on the other. The effect of the discussion was to unite and embolden the Protestants, with whom the machinations of the Guises forced Catharine into closer alliance. In 1562 appeared an edict giving noblemen the right of the free exercise of their religion on their own estates.

In March of the same year, a company of Protestants met in a barn at Vassy for religious exercises was attacked, and many of them were massacred by the followers of the Duke of Guise. On this Condé hastened to Orleans, and called his co-religionists again to his standard; whilst the Guises took possession of the persons of the king and his mother, and proclaimed the Protestants rebels. In September the royal troops took Rouen, and in December a battle was fought at Dreux, in which, after a hard struggle, the Protestants were defeated. The Duke of Guise marched on Orleans, but was assassinated in his camp before that city, February 18, 1563. Hereupon the queen-mother hastened to conclude the peace of Amboise, by which the Protestants were allowed the free exercise of their religion, except in certain districts and towns. Catharine, however, formed a close alliance with the Spaniards for the extirpation of heresy, retrenched the new liberties of the Protestants, and made attempts upon the life of Condé and of the Admiral Coligny (q.v.). These leaders of the Protestant party adopted the resolution of taking possession of the king's person. The court fled to Paris, which Condé invested; but in November 1567 a battle was fought at St Denis between Condé and the Constable Montmorency, in consequence of which Condé fell back into Lorraine; and in March 1568 Catharine concluded peace at Longjumeau. Nevertheless she persecuted the Protestants, of whom 3000 were assassinated or executed. The Protestants having, however, received assistance in troops from Germany, and in money and artillery from England, began the third religious war. But on March 13, 1569, they were defeated, and Condé their leader slain, at Jarnac by the royal troops under the Duke of Anjou, afterwards Henry III. Jeanne d'Albret, queen of Navarre, endeavoured to reanimate the Protestants, and set up her son, afterwards Henry IV., as the head of the Protestant cause. Coligny having received further assistance of

troops from Germany, laid siege to Poitiers, but was again defeated by the Duke of Anjou at Moncontour. Fresh reinforcements from England, Switzerland, and Germany enabled Coligny to take Nimes in 1569, and to relieve La Rochelle, whilst Lanoue obtained a victory over the royal troops at Luçon. Catharine and her son now sought for peace; and a treaty, concluded at St Germain-en-Laye in August 1570, gave to the Protestants an amnesty, the free exercise of their religion everywhere except in Paris, and the possession of a number of places of security.

Catharine, having failed to overthrow the Protestant cause in the open field, sought to accomplish her object by treachery; and by a general massacre of Protestants on St Bartholomew's Day (q.v.) 1572, 30,000 Huguenots were slain within two months in Paris and in the provinces. Although deprived of their leaders, and weakened by the slaughter of great numbers of their best and bravest, the Protestants flew to arms. The Duke of Anjou, after having lost his army before La Rochelle, took advantage of his election to the throne of Poland, and in 1573 concluded a peace by which the Protestants obtained the free exercise of their religion in their places of security, Montauban, Nimes, and La Rochelle. A section of the Roman Catholic nobility, at whose head was the Duke of Alençon, the youngest son of Catharine, from purely political motives united with the Protestants in opposition to the queen-mother and the Guises. Catharine, therefore, incited her third son, now Henry III., immediately to recommence hostilities against the Protestants. But, contrary to all expectation, the Protestant cause was in the highest degree prosperous during the year 1575. A peace was concluded at Beaulieu by which the Protestants were freed from all restrictions in the exercise of their religion, and obtained eight new places of security. The Duke of Guise originated a Catholic association, called the Holy League, at the head of which the king put himself in the Assembly of the States at Blois in 1576, and the sixth religious war began. Peace was, however, again concluded by the king himself at Bergerac, in 1577, on the former conditions; and Catharine, to diminish the power of the Duke of Guise, entered into a private treaty with Henry of Navarre. The terms of peace being violated by the court, Henry I., Prince of Condé, son of Louis I., commenced the seventh religious war (called the *guerre des amoureux*) in November 1579; but he and his colleague Henry of Navarre being vanquished, peace was concluded at Fleix, November 1580.

There was now a comparatively long interval of repose till 1584, when, by the death of the Duke of Anjou (formerly of Alençon), Henry of Navarre became heir to the throne of France. Hereupon Henry, Duke of Guise, exerted himself for the revival of the League, entered into an alliance with Spain and the pope for the extirpation of heresy, declared the Cardinal of Bourbon heir to the throne, and began hostilities against the Protestants. This war is commonly known as the 'war of the three Henries.' The king soon made terms with Guise, and declared all the privileges of the Protestants to be forfeited. The Protestants, having obtained troops from Germany and money from England, entered on the eighth religious war, Henry of Navarre commanding the Protestant army. The Duke of Guise, in the midst of these troubles, grasped the whole power of the state. But his designs with regard to the throne having become very evident, the king caused him and his brother the cardinal to be assassinated at the Assembly of the States at Blois in September 1588. In less than a year the king was himself assassinated by a monk named Jacques Clément, and Henry of Navarre succeeded to the throne, and signed the famous Edict of Nantes (see NANTES) on 13th April 1598.

Under the reign of Henry IV. the Protestants lived in tranquillity. But when, during the minority of Louis XIII., Mary de' Medici, the queen of Henry IV., assumed the reins of government, the marriage treaties with the Spanish court excited the apprehensions of the Protestants to such a degree that in November 1615 the Prince of Condé set up the standard of rebellion. In spite of the treaty of Loudun (1616), in June 1617 a royal edict commanded the entire suppression at once of the Protestant Church and of political privileges in the province of Béarn; an edict not carried into full effect till 1620. Hostilities again broke out in May 1621. At the head of the Protestants were the two brothers, the Duke of Rohan and the Prince Soubise. Their cause, however, was feebly maintained; and after the capitulation of Montpellier, 21st October 1622, there followed a general peace, by which the Edict of Nantes was confirmed, but the right of prohibiting the assemblies of the Protestants was assumed on the part of the crown. The court, however, paid little attention to the treaty, and the Protestants again rose in arms. Soubise, with a fleet furnished by the town of La Rochelle, oftener than once defeated the weak royal navy; and Cardinal Richelieu (q.v.) resolved upon the capture of La Rochelle. This he accomplished after a heroic resistance by the inhabitants. The fall of La Rochelle was speedily followed by that of Nimes, Montauban, Castres, and all the other Protestant strongholds. Now left defenceless, and bereft of all political power, the Protestants were entirely dependent on the will of the court, which, however, made no attempt to deprive them of their liberty of conscience. It was Louis XIV. who, at the instigation of Madame de Maintenon and his confessor Lachaise, commenced anew the persecution of the Protestants, gradually deprived them of their equal civil rights, and endeavoured to put down the Protestant Church altogether. Bodies of troops, accompanied by monks, passed through the southern provinces, compelling the inhabitants to renounce their religion, demolishing the places of worship, and putting to death the preachers (see DRAGONNADES). Fénelon was conspicuous for his zeal in seeking the conversion of Protestants. Hundreds of thousands fled to Switzerland, the Netherlands, England, and Germany. Many Protestants also made an insincere profession of Roman Catholicism. On 23d October 1685 Louis at last revoked the Edict of Nantes. Hereupon began a new flight, followed by a still more fearful persecution of the Protestants. Their marriages were declared null; their children deprived of the right of inheritance, and forcibly shut up in convents; their preachers indiscriminately put to death. From the vicinity of Nimes, where they had always been very numerous, thousands betook themselves to the mountains of the Cévennes, and continued the exercise of their religion in secret. Amongst these and the mountaineers of the Cévennes a remarkable fanatical enthusiasm displayed itself, and, under the name of Camisards (q.v.), they maintained for a number of years a wonderfully successful opposition to the forces of the great monarchy. The War of the Cévennes, or Camisard War, was not terminated till 1706, the suppression of the local rebellion being attended with circumstances of great cruelty. France lost in twenty years more than half a million of her most active, enterprising, and industrious citizens; and, notwithstanding all the persecutions, about two millions continued to adhere to the Protestant religion.

The partial repose which the Protestants enjoyed for more than ten years was attended by a revival of their worship, especially in Provence and Dauphiné. In 1724, therefore, Louis XV., at the instigation of the Jesuits, issued a severe edict against them. The spirit of the age, however, now began to be opposed to persecution. An edict of 1752 declared marriages and baptisms by Protestant ministers to be null, and required the repetition of them by the Roman Catholic clergy. But when, upon this, many began again to flee from their country, the disgust of the Roman Catholics themselves was so much excited that the court recalled the edict. Montesquieu successfully advocated the cause of toleration; Voltaire did much to promote it by his exposure of the judicial murder of John Calas (q.v.). At last, by an edict in 1787, which indeed was not registered by the parliament till 1789, Louis XVI. declared the Protestant marriages and baptisms to be valid, and restored to the Protestants equal civil rights, except that they might not be advanced to public offices and dignities. Even in 1789 a proposal for the complete emancipation of the Protestants was rejected by the National Assembly, which, however, admitted Protestants, and even Protestant preachers, as members without objection; and in 1790 it passed a decree for the restitution of all the properties of non-Catholics confiscated since the time of Louis XIV. The *Code Napoléon* gave Protestants in France equal civil and political rights with Roman Catholics. The charter granted by the Bourbons acknowledged the freedom of Protestant worship, and the state pledged itself for the maintenance of the pastors; yet under the government of the Restoration the privileges of Protestants were in many ways circumscribed. After the revolution of July 1830 the Reformed Charter of France proclaimed universal freedom of conscience and of worship, which principle has been maintained in subsequent changes. Protestants were no longer subjected to many exceptional hardships, and in various important instances were protected by Napoleon III. from the arbitrary exercise of power attempted by illiberal local magistrates adverse to their religion. But the *recognised* Protestant Church—in which are included both Reformed and Lutherans, and of which the pastors receive small salaries from the state (see FRANCE)—was not till 1872 permitted to hold synods or general assemblies or to proselytise. At a synod held in that year the conservative party in the church, in spite of some opposition, carried their proposal that the church, which had long been without a formally binding creed, should adopt an evangelical confession. French Protestants now number 700,000 approximately, with 1400 places of worship and 950 ministers.

The first Huguenot churches in England date from the 16th century, as also the introduction of the Huguenot industries, such as the woollen, worsted, and napery trades, silk-weaving, tapestry, dyeing, glass-making, pottery, and paper-making. Under Charles II. the Savoy in London was granted to the Huguenots as a place of worship, a fashionable West-end church, in which, as a token of 'conformity,' the Common Prayer-book was read in French. From 1685 onwards thousands and thousands of Huguenots found their way to England, and gave William of Orange the support of their military talent, political interest, and financial resources. The planting of Protestantism in Ireland was greatly due to the services of the Huguenots Schomberg and Ruvigny. Under Queen Anne there were thirty Huguenot churches in London alone. Towards the close of the century more than half had disappeared through the rapid absorption of the Huguenot families in the Anglican Church, and their rise to the first ranks in the gentry of England. Members of the Saurin family sat among the bishops, the son of Peter Allix became dean of Ely, the son of Casaubon was rector of Ickham, the families of Chenevix and Trench gave archbishops to Dublin and Tuam, and that of Romaine clergymen to London. Cavalier and Ligonier served under the British flag, Romilly adorned English law, the Martineaus shine in English letters; the Beauforts, Boileaus, Bosanquets, Bourdillons, Cazenoves, De Crespignys, De Villiers, Du Canes, Gossets, Layards, Millais are only a few instances taken at random out of several hundred family names of Huguenot origin.

See Rulhiere, *Eclaircissements Historiques sur les Causes de la Revocation de l'Edit des Nantes* (1788; Felice, *Hist. des Protestants en France* (1851); Haag, *La France Protestante* (1859; new ed. 1883); the works of Capefigue (1838) and Agnesse (1882); Smiles, *The Huguenots in England* (1867); H. M. Baird, *Rise of the Huguenots* (1880), and a series of three other works on their history (1885-95); R. L. Poole, *The Huguenots of the Dispersion* (1880); *Bulletin de l'Histoire du Protestantisme Français*; Transactions and publications of the Huguenot Society of London, established in 1885. See also the articles FRANCE, MAROT, HENRY IV., &c.

Huia-bird (*Heteralocha acutirostris*), a remarkable New Zealand starling, now restricted to a few wooded and mountainous regions. The plumage is black, except on the white tips of the tail feathers; there is a wattle at the corner of the mouth; the bill of the female is strikingly different from that of her mate, being long, much curved, and pliant, instead of straight and strong as in the male. The difference is so marked that the two sexes were formerly referred to distinct species. In digging grubs out of wood the two kinds of bills supplement one another. The birds, which are becoming rare, submit readily to captivity.

Hulks. See PRISONS, Vol. VIII., p. 418.

Hull, or KINGSTON-ON-HULL, an important and flourishing English river-port, a parliamentary and municipal borough and county of itself, is situated in the East Riding of Yorkshire, in a low, level plain on the north bank of the Humber, here 2 miles wide, and here joined by the Hull, 42 miles ESE. of York and 173 N. of London. Of churches the most notable are Holy Trinity, Decorated and Perpendicular in style, with a central tower 140 feet high; and St Mary's Lowgate (1333), one-half of which was removed to make room for the mansion-house of Henry VIII., who stayed here in 1540. Both were restored by Sir G. G. Scott. All Saints' Church (1869), from designs of Street, is a good example of a brick church. The most important educational establishments are Hull and East Riding College; the Hull grammar-school (1486), where Andrew Marvell was educated; and Trinity House School (1716), where a large number of boys receive a nautical education; to which may be added the Literary and Philosophical Society, the Royal Institution, the Hull Church Institute, Young People's Christian Institution, Literary Club, College of Chemistry, Mechanics' Institute, the School of Art. An equestrian statue (1734) of William III. stands in the market-place, and in Junction Street is a column (1834) surmounted by a statue of Wilberforce, who was a native, as also was Mason the poet. Among many other benevolent establishments, the Trinity House, instituted in 1369, but rebuilt in 1753, for the relief of decayed seamen, and the Charterhouse (rebuilt 1645), an endowed institution for the poor, are the most worthy of note. There are three prettily laid out public parks. A town-hall, Italian Renaissance in style, was opened in 1866, as also was a new exchange. There are also a spacious gaol (1869), a new post-office (1877), the Theatre Royal (1873),

the dock-office (1871), public baths (1850), a new market-hall (1887), and the James Reckitt Free Library (1889).

The docks and basins, comprising an area of upwards of 200 acres, have been constructed since 1774. The Victoria Dock (1850–64) covers 20 acres, exclusive of two large timber ponds and tidal basins which contain an area of about 9 acres; it partly occupies the site of an old citadel with a battery of twenty-one guns, which till 1864 commanded the entrance of Hull Roads and the Humber. The Albert Dock (24½ acres) was opened in 1869; and the Alexandra Dock (40 acres) in 1883, on the same day as the Hull and Barnsley Railway. Hull was one of the first ports in England to engage in the whale-fishery, an enterprise which has been abandoned; but its fisheries for edible fish employ, in conjunction with those of Grimsby, large fleets of boats, attended by steam auxiliaries. Hull is a principal steam-packet station, and ocean-steamers ply regularly to many of the principal ports of Belgium, Holland, Denmark, Russia, Germany, and Scandinavia. Its home trade is also very extensive. It is the great outlet for the woollen and cotton goods of the midland counties, with which it has direct communication, by means of railway, river, or canal. It is the chief entrepôt for German and Scandinavian oversea trade. There is also regular steam communication with New York and Boston; and an Australian trade and a very important trade with India have been inaugurated. Hull ranks third among British ports, the average yearly value of its imports exceeding £20,000,000, of its exports £16,000,000. From its geographical position it is confidently believed that, even were the interior of the country canalised as far as Leeds, the port at the mouth of the Humber would continue to maintain the position of third entrepôt of the kingdom. Shipbuilding yards are in operation; and, in addition to iron ships, important ironclads have been built here for British and several foreign governments. The chief manufactures are those principally to which a flourishing port gives rise, as ropes, canvas, chain, chain-cables, machinery, &c. Many mills of various kinds are carried on, as well as chemical factories, tanneries, and sugar-refineries. Seed-crushing for oil is also an important staple industry, in which a large amount of capital is invested. Constituted the free borough of Kingston-on-Hull by Edward I. in 1299, the town owed much to its great merchant-house, the De la Poles, whose head, Michael, in 1385 was created Earl of Suffolk. In 1642 the refusal of its governor, Sir John Hotham, to admit Charles within its walls marked the outbreak of the Civil War, during which Hull was twice besieged by the royalists. It was made the seat of a suffragan bishop in 1534, and again in 1891. Since 1885 Hull has returned three instead of two members to parliament. The Hymers Library was given to the town in 1893, in which year there was a great dockers strike, with riots and incendiary fires in timber yards. Pop. (1851) 84,690; (1881) 165,690; (1891) 199,991.

See local works by Gent (1735; new ed. 1869), Frost (1827), Symons (1862), Sheahan (1864), and Tindall Wildridge (1888); also Freeman's *English Towns* (1883).

Hull, the chief town of Ottawa county, Quebec, is on the Ottawa River, opposite Ottawa (q.v.), with which it is connected by a suspension bridge. It was almost wholly burnt down in April 1900. Pop. (1881) 6890; (1891) 11,264.

Hull, WILLIAM, general, was born at Derby, Connecticut, in 1753, fought in the war of independence, and governed Michigan territory in 1805–12. In 1812 he was sent with an ill-found army of 1500 men to defend Detroit; there he was left without supplies, shut in by British and Indians, and ultimately compelled to surrender. The government needed a scapegoat, and Hull was tried by court-martial and sentenced to be shot. The sentence, however, was never carried out, and he died on his farm at Newton, Massachusetts, in 1825.

His nephew, ISAAC HULL, naval officer, was born at Derby, Connecticut, 9th March 1773, became a cabin-boy at fourteen, rose to the command of a ship in the West Indian trade, and in 1798 entered the newly-established American navy as a fourth-lieutenant. He was appointed to the *Constitution* frigate, which he commanded as captain from 1806. Hull was an able seaman, and in July 1812 his skill in sailing his ship enabled him to escape from an English squadron, after a pursuit of three days and nights. On August 19 of the same year he captured the British frigate *Guerriere*, forty-four guns, after a close action of thirty minutes; the *Constitution* losing fourteen killed and wounded, the *Guerriere* seventy-nine. The *Guerriere* was so injured that she had to be burned; while Hull's frigate escaped with such slight damage as to gain for her the name of 'Old Ironsides.' Hull received a medal from congress, swords of honour, and the freedom of several cities. He afterwards commanded squadrons in the Mediterranean and Pacific, retired in 1841, and died in Philadelphia, 13th February 1843. See the Life by General James Grant Wilson (New York, 1889).

Hullah, JOHN PYKE, the pioneer of music for the people, was born at Worcester, 27th June 1812. He studied at the Royal Academy of Music, and in 1836 composed *The Village Coquettes* to Charles Dickens's libretto. In 1840 he began popular singing-classes in Exeter Hall, London, in which, during a course of twenty years' teaching, he trained thousands to use their voice in singing. He was for several years professor of Vocal Music in King's College, and taught at other schools and colleges in the metropolis; and from 1874 to 1882 was appointed inspector of training-schools for the United Kingdom. Hullah, who followed a modification of Wilhem's system, had little sympathy with recent developments of modern music, and opposed the 'Tonic Sol-fa' method. He published amongst other works a *History of Modern Music* (1862) and *The Third Period of Musical History* (1865). Of his songs, 'The Three Fishers' and 'The Storm' attained wide popularity. He died in London, 21st February 1884. See the Life by his wife (1886).

Hulsean Lectures, &c. The Rev. John Hulse, born at Middlewich, Cheshire, in 1708, educated at St John's College, Cambridge, and died in 1789, bequeathed his property to the university, for the founding of two divinity scholarships in St John's College, the Hulsean Prize, the office of Christian Advocate (in 1860 changed into the Hulsean Professorship of Divinity), and that of Hulsean Lecturer or Christian Preacher. The lecturer, appointed annually, must deliver at least four lectures before the university, although the number required was originally twenty, afterwards reduced to eight, and since 1860 to four. The subjects are 'the Evidence for Revealed Religion; the Truth and Excellence of Christianity; Prophecies and Miracles; Direct or Collateral Proofs of the Christian Religion, especially the Collateral Arguments; the most difficult Texts or Obscure Parts of Holy Scripture.' Among the lecturers have been Trench, Christopher Wordsworth, Ellicott, Dean Howson, Farrar, Dr E. A. Abbott, and Bishop Boyd Carpenter.

Humane Society, THE, was formed in 1774 by Dr Hawes and Dr Cogan and thirty-two others,

in London, for the purpose of resuscitating those who had been immersed in water and were apparently drowned. At the present time it distributes rewards, consisting of medals, clasps, testimonials, and sums of money, to those who save or attempt to save life from drowning. Also 'all cases of exceptional bravery in rescuing or attempting to rescue persons from asphyxia in mines, wells, blast furnaces, or in sewers where foul gas may endanger life, are recognisable by the society.' It likewise gives prizes for swimming to the pupils of public schools and of training-ships. Boats and boatmen

Medal of the Royal Humane Society
(actual size 1½ inch diameter).

are kept on the Serpentine in Hyde Park for the purpose of watching over the bathers who resort thither. And during the skating season experienced icemen are sent to the various waters in and around London to help in case of accidents. The society is supported by bequests and private subscriptions. Since 1873 the Stanhope gold medal has been awarded 'to the case exhibiting greatest gallantry during the year.' In 1889 more than five hundred rewards were distributed, one hundred more than in any other year since the foundation of the society. The figure shows the medal of the society. Another reverse is used when it is presented to persons who have risked their lives to save others, but without success; the inscription is 'VITA PERICULO EXPOSITA DONO DEDIT SOCIETAS REGIA HUMANA.' See *Annual Report of the Royal Humane Society* (4 Trafalgar Square, W.C.).

Humanists (Lat. *literæ humaniores*, 'polite letters'—whence the title *Humanity* for the professorship of Latin in Scottish universities; Ital. *umanista*), the name assumed at the revival of learning by those who looked upon the cultivation of classical literature as the most valuable instrument of education, in opposition to those who clung to the ancient methods of the Scholastics (q.v.). In their modes of thought also the tendency of the humanists was to exalt Paganism at the expense of Christianity. In the 18th century the name became a word of reproach for those who showed a blind zeal for the classics as the sole educational subject, opposing the Philanthropists, who asserted the value of mathematics, science, modern languages, and history. The name is often given to the foremost representatives of classical learning from the time of the Renaissance (q.v.) onwards, such as Erasmus, Sir Thomas More, Ulrich von Hutten, George Buchanan, &c.

Humanitarians, a name assigned to anti Trinitarians, who regard Christ as a mere man, and refuse to ascribe to him any supernatural character, whether of origin or of nature (see UNITARIANS). The name Humanitarian is also sometimes applied to the disciples of St Simon, and in general to those who look to the perfectibility of human nature as their great moral and social dogma; also to those who, from over-philanthropy, object to severe measures, such as capital punishment, &c. For the religion of Humanity, see POSITIVISM.
